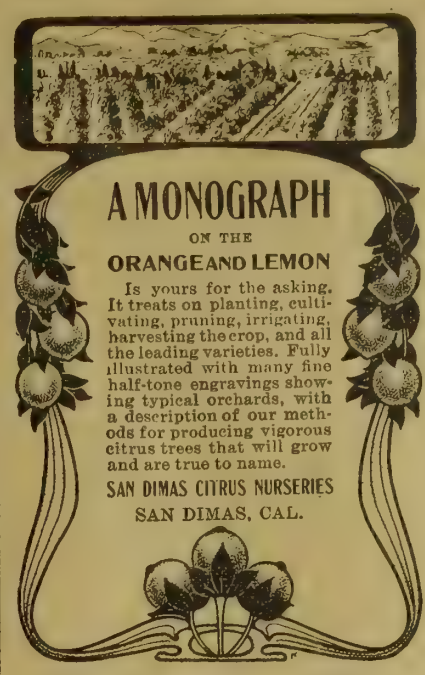
"The latest estimate places the total number of apple trees of bearing age in the United States at something over two hundred millions. This is nearly three trees to every person. These trees yield more than one hundred and seventy-five million bushels. Not all these apples are consumed at home, for in years of full crop more than three millions bushels go abroad. Yet, the apples kept at home are more than two bushels for every adult and child. We are a nation of apple eaters. This fact may not be to our credit, however, when we remember that a good part of all these apples are Ben Davis and other kinds that a refined and cultivated taste would not choose for its dessert. Yet probably half our people never raise an apple; and of the half who do raise them, but a small percentage grows for market; and of those who grow for market only a part make a profit from the business. Yet there is money in apple growing."—Country Life in America.

MONEY IN FLOWERS.

The flower field is big with possibilities for rich and poor. From the man with creative energy who would labor over new types and think a flower with a new tint or form the reward of several years of toil, it is but a step, though a long one, to the more commercially inclined who sees big money in a large industry and essays the cultivation of a tract that would be a principality in any of the old countries; raising flowers by the square mile, shipping seed by the carload, and employing men by the score. It is but another step to the next who deals in the seed that his large business does not give him time to raise, his wholesale supplier of cut-flowers, who raises roses or carnations by the square mile. And then on through the various gradations of wholesale and retail "specialists", including the popular decorator whose alert eye sees merit in a discarded weed and raises it by patronage to be an article of commerce; and does not exclude the street-venders, picturesque and clamorous over their second day stock, as they bring up in the rear of the floral procession of California.—Ednah Robinson in Sunset Magazine for September.



Scott's Wax A SURE CURE FOR Gum Disease

Made after the formula of Mr. John Scott, late Horticultural Commissioner, by
S. M. WOODBRIDGE, Ph. D., So. Pasadena, Cal.

DIRECTIONS—Cut away the diseased parts of the tree, allow to dry, and apply melted wax with a brush.

The Famous
Burgess Steam Washer
NO RUBBING! NO WASHBOARD!

Saves Strength, Fuel, Labor, Soap, Time. Family Washing Done in One-Half the Time.

Agents Wanted. Where there are no agents, will sell a few machines at very low prices, to introduce them. Satisfaction guaranteed or money refunded. (Have never been asked to refund money yet.)

It is the only machine that will wash when you are away from it, as well as when by it.
It sits on a furnace, cook, gas, or gasoline stove, from which it derives its motive power.
It washes and boils at the same time, all parts perfectly, without rubbing.
A weakly lady, or a child 10 to 12 years old can operate it.
It does not require a constant turning of the cylinder, as all other so-called steam washers do.
It is constructed on a scientific principle, that of forcing steam and water at a boiling point through the fibre thus driving out the dirt and depositing it under a false bottom where it is retained, and never comes in contact with the clothing a second time.
Your clothing is not in the water, and is washed in pure steam, which is the only correct principle on which to clean clothing.
Clothing washed in this machine, will bleach perfectly white.
It will wash all kinds of white goods, ginghams, laces, woolen and colored goods, more perfectly than can be done by hand.
It will wash and boil fifteen fine shirts or an equivalent of clothing, in from ten to fifteen minutes.
It will wash lace curtains, embroideries, and all delicate goods, without injuring a thread, and better than they can be washed in any other way.

The cost of this machine will be saved in one year, in wear of clothing.
As there is no rubbing, there can be no wear.
All rubbing, jerking, pounding and sloshing macines wear and tear the clothing more than the ordinary wear of them.

What the People Say of them.

We have used one in our family and find it a great labor-saving machine. I am prepared to recommend it as excellent. Those who sell them are benefactors to womankind.
L. Wallace,
Pastor Congregational Church,
Wyandotte, Cal.

Our washings are large—used to take all day and part of the next day. Now, with the Burgess Steam Wa her, it takes but half a day.
Mrs. W. H. Adams,
Honcut, Cal.

To say that it is a good machine would not express it. It is simply lovely—would not part with mine for any money. In fact, could not get along without it. Mrs. F. Baker,
Palermo, Cal.

It is a good machine, and does all you claim for it. W. Holt,
Woodland, Cal.

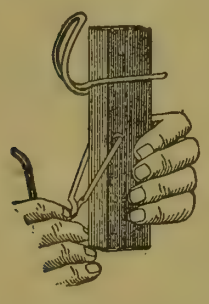
Be Sure and Get



Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

J. K. Woodward & Co.

171 NinthSt. Riverside, Cal.

THE Vernon Nursery

We will offer 100,000 deciduous fruit trees for sale next season

DECIDUOUS FRUITS

J. W. MILLS, ONTARIO, CAL.

OLIVES ON A STRIKE.

Editor Cultivator: I have two rows of olive trees about eleven years old and they are in a perfectly healthy condition. They blossom every year but they fail to set any fruit. Some of my neighbors say that they will never bear any fruit, while others say they will bear in a year or two. They are about one mile from the foothills. I fertilize them with barnyard manure and irrigate them regularly. The land on every side of these trees produces a good quality of citrus and deciduous fruits. Can you give me any advice in regard to these trees?—S. P., Monrovia.

You do not state what variety of olives you have. Some varieties will not bear when planted by themselves and are even then very shy bearers. The only advice that we can give is to graft some of them over to Mission and Rubra. These two varieties will pollinate them during most seasons and the last named is known to be a particularly good variety for that purpose. We are surmising that your trees are of the Nevadillo Blanco variety. Should they be Missions and do not bear with the treatment you have been giving them, you had better grub them out and plant lemons or walnut trees in their place and take part of their product to buy what olives you need. We are not sure that it is not the best plan in any event.

* * *

STOCK MELONS, CARROTS, BEETS

Editor Cultivator: I planted some Tsama melon seeds this year and the vines and melons are doing very well on my soil without much or any water. I write to ask if you can tell me what is the matter with one of the vines which seems to have some sort of disease or parasite, which makes the vine and ground underneath it brown and dirty, as covered with a brown dust. Not knowing what was the matter with it, I tore up the vine and destroyed it. Can you tell me, from this description, what is the matter with the vine and the remedy?

Also, will you advise what, in your opinion, is the adaptability of our soil up here immediately south of Arrowhead Springs, a deep gravelly loam, very like much of the soil in the foothills above Pomona, to the cultivation of carrots and sugar beets, if they are sowed during the rainy season?—M. S. Severance, Arrowhead.

The usual cause of the appearance which you describe above as affecting your melon vine is due to plant lice. They cause the leaves to curl and the vines and ground become covered with honeydew that exudes from the lice. There is usually a growth of fungus that grows on the honeydew, causing the dark color. It was proper to remove and destroy the plant. You can sometimes stop the spread of the insects if taken in time. If they become scattered throughout the field so that the vines are affected to considerable extent, there is no practical artificial remedy of curing the trouble. There are plenty of things that will kill the lice, but they will not justify the outlay on a large scale. For instance, a garden patch of melons might be covered with sheets and fumigated, but it would not pay to go over a whole field that way. There is a parasite that works on the melon plant lice so that they will not increase indefinitely. Toward the middle of the season they generally die off to such an extent that they do no harm. Usually, the second season equalizes the numbers of lice and parasites so that little harm is done from then on.

We do not consider such land as you describe good sugar beet land. By early planting which will enable the beets to grow during the winter you may succeed in securing five or six tons of beets per acre. That would not be a paying crop. Sugar beets do not take kindly to irrigation on land with considerable slope, as the soil is washed away from them. With stock beets it is different as they appear to do as well when half out of the ground as the other way. Carrots will do well with irrigation on the land you describe. They root deeply and do not require such frequent irrigation as sugar beets.

* * *

TABLE GRAPES FOR SAN DIMAS.

Editor Cultivator: I would like to know what varieties of table grapes will do best, and if you would advise planting same on soil which is rather on the heavy clay order? The subsoil is hard. I wish to plant eight acres that I have here at San Dimas.—W. H. C.

We could not give you direct advice on the subject without knowing of the hard subsoil is really available soil or hardpan. We certainly would not recommend planting grapes on two or three feet of soil with a hardpan bottom. You might get some good grapes, but they would be likely to have poor bunches, making them unattractive and poor sellers. Like trees, grape vines do their best in good soil. Such varieties as Flaming Tokay and Purple Cornichon do well on heavy clay land, or one with a heavy clay subsoil that is inclined to be red. Such soil seems to give the grapes better color. If the land is underlaid with hard pan, you had better confine your plantings to annual crops or strawberries. While such crops do better on deep soil, they are more profitable on shallow ones than deep rooting plats. Grape vines planted on soils that were two to four feet deep on the Paso Robles experiment station, bore well for the first few years and then began to fail. Grape vines send their roots 30 or 40 feet down into the soil if there is no obstruction.

* * *

GLENDALE QUESTIONS.

(1). What is the best way to treat "gophered" orange trees? Should the tops be cut back; if so, how severely; how should the barked stump be treated?

(2). When is the best time to sow field peas in an orange orchard- How far apart should the rows be? Should they be cultivated and irrigated; if so, how much? Please give general treatment of soil and crop.

(3). What is the latest recommendation of the State University for the treatment of red spider on orange trees and formula for spray? How effective is distillate as applied for black scale Will red spider, just now appearing, do sufficient damage before winter to justify spraying?

(4). In case of an orchard plowed too late, what is the best means of pulverizing the lumps? I have a piece so lumpy that it is hard to cultivate and irrigate. Is a disc harrow most effective and will it do enough work after the first time to pay to go over it again or even twice more?—Ernest Braunton, Glendale.

* * *

(1). If an orange tree is so badly gophered as to turn the leaves yellow, it should be cut back so as to remove all of the fine brush and leave the main branches and retain the shape of the tree. Give it about a pound of nitrate of soda in a basin about four to eight foot across, according to the size of the tree, fill it up with water often enough to soak the nitrate down into the soil where most of the fibrous roots grow. Paint the barked places with a grafting wax made of one pound of mutton tallow, two pounds of beeswax and four pounds of resin; mix well while boiling and pour into a tub of tepid water and pull until it becomes light in color. Apply it with a brush when warm. Spray the whole tree, from top to bottom with whitewash and keep it well supplied with moisture. If the tree does not make a reasonably good start and take on a healthy color, pull it out and put in another one. Give it till after the early growing period in the spring, when it will be ample time to replace it, should it not respond.

* * *

(2). If you have plenty of water for irrigating, August or September is the best time to plant field peas for green fertilizer. Get them up high enough to plow under so that they will rot during the winter time and be available for the tree roots in the spring, when nitrification takes place most rapidly in the soil. We have been planting for winter growth during most of the time during the past, but we are not sure that it was the proper thing to do. It strikes us that we will get more humus in the soil by getting the green stuff under before winter. When it is plowed under in the spring, a great deal of it is dried out or lost in the dry surface soil, or does not come into use for another year. While we may have to use more water during the late summer months while growing a crop at that time, we can economize during the winter and spring by thorough cultivation; besides, the soil will not pack so tight when there is a lot of vegetation underneath during the rainy season. For summer planting of peas in the orchard, we would recommend furrowing out with a cultivator, placing the small shovels twelve inches apart on the frame. Run the water down these and soak the ground thoroughly. Do not make the furrows over three inches deep. As soon as the ground is dry enough to work properly, sow the peas broadcast just as you would wheat; 99 per cent of the peas will roll into the furrows. Take the same cultivator and split the ridges made by the first furrowing out and you will cover the peas up in good shape. Run over this with a light harrow with the teeth slanting back so as to cut and fine the surface after the frame of the harrow has pressed it down. The cultivation which covers the peas should be deeper than the first one (preparing for irrigation) so that the soil will be well stirred and the bottoms of the furrows in which the peas lie be broken up as much as possible. If the peas are soaked over night before planting you will have them up and growing in three days. If the land has never grown peas before, get a little soil from a field or patch where peas have grown last year and add it to the water in which you soak the seed. Be sure to get the soil from at least a foot below the surface, or the germs which should inoculate the seed may be destroyed, as they perish when allowed to become dry and hot. This will require very little labor and will be likely to insure a good crop of vines.

* * *

(3). The plan of battle against the red spider does not seem to be completely worked out yet. It is known that spraying with distillate will kill the eggs and spiders when touched, but enough seem to escape contact to keep up the supply. Distillate is very apt to injure the foliage more or less and should not be applied to orange trees too often as it requires time for the leaves to recover and this period is found to be so long that the red spider has time to bring out another numerous family before it is safe to spray again. We are informed that sulphur thrown into the trees is about as effective as anything and does no harm to the trees or fruit. This is applied in the deciduous fruit sections of the north for the red spider that attacks that class of fruit trees by means of a seed sower attached to a heavy farm wagon. With the citrus red spider, it has not been so effective though it has not been so thoroughly tested on the latter, still we have heard of good results. The greatest efficiency with the sulphur when applied as a fungicide or insecticide, is obtained when the weather is hot, while the insects are active. It will not affect the eggs in the least. Sulphide of potash is recommended as a safe and sure remedy. 32 pounds of potash

and 37 pounds of sulphur and mixed in 50 gallons of water and 2 pounds of salt. After the boiling has stopped, use one gallon of the mixture to 100 gallons of water to spray with. This should be applied once a week for three weeks.

[It may be added that while in Tulare county last week we were informed by a nurseryman that the sulphur remedy had proved almost a complete failure with him. This is not meant to discourage, but to encourage some grower to try different remedies, side by side, and report. —Ed.]

* * *

(4.) In answer to your fourth question, we will say that a disc is not of much use where the clods are loose and roll around. The disc is made to cut up ground that is crusty. The Acme harrow is a good clod smasher and leaves the soil in good shape. In case you cannot get one of those, a roller would be the next best thing. An iron harrow with the teeth slanting backward and weighted down will also do the work. The most effective implement for such work is what beet farmers call a "horned toad;" it is a cast iron roller with sections about two inches wide and eighteen inches in diameter, every alternate one of which is loose on the shaft. The sections are nothing more than heavy wheels with sharp projections on what would be the tires. I give this list so that you may choose from what might be at your command. As to the advisability of your going over the ground more than once, that depends on the condition of land after you have smashed it once. You must be the judge of that. The "Horned Toad" machine would do the work in one operation. The Acme harrow would take about everything reducible by going over the ground twice.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

ECZEMA

Have a buggy horse nine years old, has little work to do, is well fed on oats, hay and four quarts of barley three times each day. He broke out under back pad quite severely and trouble spread a foot in each direction and looks like mange—gradually the thin—and while the "mange" has disappeared upon giving him green food he will not gain in flesh. Can you suggest an ailment and the remedy therefor?

Ernest Braunton, Glendale.

Give a purgative pill composed of 1 oz. aloes and 1 dram each of nux vomica, beladonna and ginger. Rest the horse a few days.

CHRONIC COUGH.

Editor Cultivator: I have a fine little Jersey cow which will calve about 16th of November. She has had a cough for stme time. Can you give in your veterinary columns a remedy; also cough in pigs and horse?—Chas. T. Rorke, Sebastopol.

Glyco-Heroin (Smith) is probably the best preparation for chronic cough. The dose for the different animals comes with the bottle.

J. W. Mills, of Pomona Experiment Station is making great preparations to entertain the Farmers' Club next Monday, the 14th. Prof. Leroy Anderson, F. K. Maskew and Mrs. Sherman will be the principal speakers.

A meeting of fruit growers was held at San Jose Saturday to discuss and fix a price on the prune crop. From reports gathered it was learned that former estimates were too high, and the loss in curing was heavier this year than usual. No price was agreed upon at the meeting.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

CALIFORNIA FRUIT INDUSTRIES.

From the report of Prof. E. J. Wickson of the University of California made to the American Pomological Society, now in session in Boston, we are permitted to quote:

The entire report has much of interest, but we are required by limited space to condense it very much.

Last year's shipments in tons were as follows:

Citrus fruits, 225,668; fresh deciduous fruits, 100,390; dried deciduous fruits, 151,944; raisins, 47,575; nuts, 10,918; canned fruits, 80,364; wine and brandy, 88,682; total, 705,811.

Expressed in carloads, the comparative amount of the different kinds of deciduous fruits shipped in 1902 out of the state were as follows:

"Cherries, 245; apricots, 221; peaches, 1,777; plums, 1,480; pears, 2,003; grapes, 970; apples, 309; mixed, 20; total, 7,025.

Prof. Wickson says:

"Fruit growing districts have the busiest towns, the handsomest rural improvements, the largest assessment rolls, and are most attractive to home seekers."

As to the growing favorites, he adds:

The fruits which have recently advanced most notably are the two pomological kings, the orange and the apple.

The orange industry is reviewed at some length. The acreage of this fruit has increased five-fold during the last five years. Reference is made to the large amount of rebudding of lemons to oranges.

The apple acreage is increasing in all parts of the state, but most notably in the Pajaro valley. In this region the commercial handling of the apple has reached the most systematic and greatest development. The output of Pajaro valley apples has increased from 765 carloads in 1897-8 to 2200 carloads in 1901-2, and only about one-third of the trees are now of bearing age.

The grape is next in increase of planting during the past two years, although the planting does not represent a net gain of acreage. In some parts there is a constant loss of acreage by phylloxera, and by the mysterious Anaheim "disease."

The prune acreage of the state has declined slightly because of the failure and consequent eradication of trees planted in unsuitable locations. Though the acreage has increased in the best districts such new plantings have been more than offset by the clearings, and the prune industry is now in very promising shape.

The apricot also has sold well. It is growing in favor.

The peach has made a distinct advance during the last two years.

The peach combines the three great outlet avenues of fresh shipments, canned and dried products, as no other fruit can.

The cherry is gaining ground continually.

The fig industry comes upon a new basis through the acclimation of the pollination insect which is essential to the success of the Smyrna fig.

The olive has not realized all the expectations which California planters have cherished for it. * * * California will produce profitably good olives and olive products in suitable places and through the efforts of masterful men and women who can rise to the requirements of production and protection against imitation articles of the trade.

Co-operation marketing occupies considerable attention. The failure of the Prune Growers' Association, the partial success of the raisin and citrus growers' co-operative movements to some have proved discouraging, yet Prof. Wickson finds much of encouragement for the future. "Co-operation among California fruit growers is all the stronger because of the failures it has made. We have now in California from 75 to 100 local associations, most of them owning property in packing houses."

By-products of fruits, irrigation, culture methods, frost-fending, propagation and horticultural institutes are each reviewed.

As a whole the report shows a most gratifying condition of the horticultural conditions of the state.

PEACH ROOT BORER.

(Continued from first page)

knot are also favorite places for the borer to thrive.

"Carbon Bisulphide.—To get the best and quickest results from the carbon bisulphide, the soil surrounding the tree should be as loose as possible. To accomplish this, remove the soil from the base of the tree as shown in diagram (Fig. 4, D). It should be from six to eight inches from the bark to the edge of the trench, and as deep as there are indications of the borer; the gummy masses and castings indicate the location of the borer (Fig. 4, A and B). Then this trench should be filled up to the level with some mellow soil from the surface of the ground, as is shown in diagram (Fig. 5, E). Now we are ready to put the carbon bisulphide around the tree; from one and one half to two and one-half ounces are used according to size of tree. It is

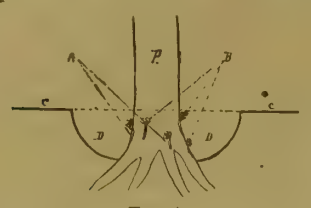

FIG. 4.
Peach tree. A Burrows of borers exposed. B. Gum and castings. C. Surface of soil. D. Trench

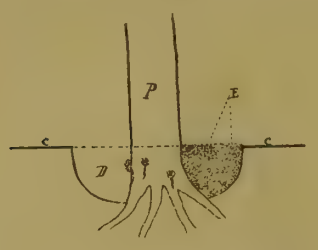

FIG. 5.
F. Mellow earth filled in trench.

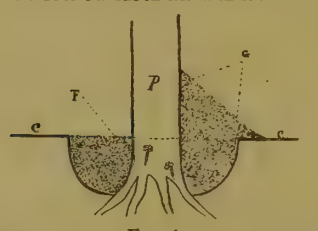

FIG. 6.
F. Location to put carbon bisulphide. G. Soil covering carbon bisulphide after application.

safest not to put the liquid on the bark, but about one and a half or two inches from it, as indicated in Fig. 6, at F. After the liquid has been put around the tree as directed, it should be immediately covered with six or eight inches of pulverized soil and pressed down with a shovel, as indicated in Fig. 6, G. If these directions are followed there is no reason for failing to kill the borer. Experience has taught us that the fumes will remain about the tree for from a few days to a couple of weeks, and if rain should fall after the application, some damage may result. We therefore recommend the removal of the soil from the trench after a few days; or if rain should follow the application, the soil should be removed at once. This remedy, applied in November or December and followed with the lime, coal tar, and whale-oil soap wash, as a barrier, will reduce this terrible pest."

In conversation with the Cultivator reporter, Mr. Ehrhorn reinforced the warning to remove the soil containing the bisulphide. If no rain follows no injury will result, but if it should rain trees are killed if a quantity of the drug still remains.

The application of strong washes and coal tar is condemned as is gas lime, which may kill the tree. The binding of tobacco stems about tree below surface of soil, and use of cheap tobacco dust from cigar factories is deemed worthy of further experiment.

Preventive Measures.—This is a case where prevention is far better than a cure. Good, stout parrafine paper is recommended. Wrap about tree and tie tightly in several places. Wrap from six inches below surface to eighteen inches above. Have broad lap. Apply about the middle of March.

Lime, Coal Tar and Whale-oil Soap.—Probably the best preventive used today is a compound of the following ingredients:

Unslaked lime .....50 pounds.
Coal tar .....1½ gallons.
Whale-oil soap .....12 pounds.

To make the compound, slake the lime and tar together, adding enough water to make a moderately thick whitewash. Dissolve the soap with hot water and add this to the lime solution, adding enough water to make a thick, paste-like whitewash. For economy, some fine sandy soil may be added to make quantity, but not too much, otherwise the compound will become too brittle when dry, and will lose its purpose."

C. H. SESSIONS, ASSOCIATE EDITOR

ABOUT THE COW STABLE.

A person suffering from any disease, or who has been exposed to a contagious disease, must remain away from the cows and the milk.

Keep dairy cattle in a room or building by themselves. It is preferable to have no cellar below and no storage loft above.

Stables should be well ventilated, lighted and drained; should have tight floors and walls and be plainly constructed.

Never use musty or dirty litter.

Allow no strong smelling material in the stable for any length of time. Store the manure under cover outside the cow stable and remove it to a distance as often as practicable.

Whitewash the stable once or twice a year; use land plaster in the manure gutters daily.

Use no dry, dusty feed just previous to milking; if fodder is dusty, springle it before it is fed.

Clean and thoroughly air the stable before milking; in hot weather sprinkle the floor.

Keep the stable and dairy room in good condition, and then insist that the dairy, factory, or place where the milk goes be kept equally well.

Have the herd examined at least twice a year by a skilled veterinarian.

Promptly remove from the herd any animal suspected of being in bad health, and reject her milk. Never add an animal to the herd until certain it is free from disease, especially tuberculosis.

Do not move cows faster than a comfortable walk while on the way to place of milking or feeding.

Never allow the cows to become excited by hard driving, abuse, loud talking, or unnecessary disturbance; do not expose them to cold or storms.

Do not change the feed suddenly.

Feed liberally, and use only fresh, palatable feed stuffs; in no case should decomposed or moldy material be given.

Provide water in abundance, easy of access, and always pure; fresh, but not too cold.

Salt should always be accessible.

Do not allow any strong flavored food, like garlic, cabbage, and turnips, to be eaten, except immediately after milking.

Clean the entire body of the cow daily. If hair in the region of the udder is not easily kept clean it should be clipped.

Do not milk within twenty days before calving, nor for three to five days afterwards.

The live stock census of the Department of Agriculture for 1902, shows that the net increase of horses in the United States during the year was only 26,149 head. This is much less than the increase in population and the business activities in which horses are employed, and shows why horses are so scarce and in such great demand at high prices. Of course one cannot tell what the future has in store for us, but it is a sure thing that unless some unforeseen financial crash, of which there are no signs now, occurs, horses will continue in good demand and prices will be high for a long time in the future. If farmers will raise good horses, they are certain to get good prices for them.—Farmers' Tribune.

THE NUMBER OF MEAT ANIMALS IN THE WORLD.

The following is considered the most reliable estimate of the number of meat animals in the world:

Cattle 310,000,000
Sheep 600,000,000
Hogs 100,000,000
Goats 7,000,000

This is 1,080,000,000 animals to feed for the 700,000,000 meat eating people of the earth.

GOVERNMENT WHITEWASH.

We gave recently a good durable whitewash for fence and chicken house. A request is made for the formula of the whitewash used by the government. It is said to be the very best that can be made. Here it is:

Put two pails of boiling water into a barrel and add one-half bushel of well burned, fresh quick lime; put in quickly one peck of common salt, previously dissolved in hot water, and cover the barrel tightly to keep in the steam while the lime is slacking. When violent bubbling is over, stir until well mixed together, and, if necessary, add more boiling water, so as to have the mass like thick cream. Strain through a sieve or coarse cloth. Make a thin starch of three pounds of rice flour and one pound of strong glue, having first soaked the glue in cold water, and to the mixture add two pounds of whiting. Add this to the lime wash, and also sufficient hot water to dilute to the proper consistency. Keep hot while applying it. Six quarts of the mixture will cover 100 square feet of surface, and it may be made any color desired.

SLEEPY HOLLOW HERD OF HOLSTEIN CATTLE
We have just received from the Eastern States two carloads of officially tested cows. This has overcrowded us for the present, and to make room we are offering some excellent young cows for sale. They are all in calf to our great herd bulls, and right now are in fine condition to ship. For full particulars write
R. M. HOTALING
Rialto Building San Francisco, Cal.

The U. S. Leads the World
That the U. S. Separator leads all others has been proved so many times that it is a well-established fact. To those who doubt it, we call attention to two very decisive victories: one at the Pan-American Model Dairy, where
The U. S. Won the World's Record
with the average test of .0138 for 50 consecutive runs; the other the recent competitive test between six different makes of separators at the Kansas State Agricultural College, where
The U. S. Excelled All Others
in the tests of skimmilk and total minimum loss, according to Press Bulletin No. 123.
For reports of many other victories, write for catalogues.
We have the following transfer points: Chicago, La Crosse, Minneapolis, Omaha, Sioux City, Montreal, Quebec, Sherbrooke, P. Q., Hamilton, Ont.
Address all letters to Bellows Falls, Vt.
Vermont Farm Machine Co., Bellows Falls, Vt.

Stock men are scared over the many deaths of cattle in the vicinity of Courtland and Franklin. Dr. A. R. Ward, of the State University, has investigated the matter. He gives it as his opinion that the trouble is anthrax, contracted by the animals drinking water from the old drainage canal.

From a bulletin recently issued by the State Dairy Bureau we learn that the dairying business is growing steadily. The production of butter increased from 23,591,028 pounds in 1898 to 31,528,962 pounds in 1902.

Four years ago no one supposed that hemp could be successfully grown in California. Thomas & Ettlinger, of Sacramento county thought differently. They began experimenting and this year they have 400 acres in hemp, the stalks of which are eight to ten feet in length. The product will bring a good price. Others are preparing to plant quite largely next year.

WANTED Twelve—more or less —high grade **JERSEYS**

from this county or adjoining counties. Must be strictly good individuals.

W. M. MARCH

1798 W. 39th St. Los Angeles, Cal.

WANTED

A young man who is a good milker and experienced in caring for cows, to take charge of our small herd of Jerseys. A good opportunity for a man who desires to add scientific knowledge of feeding and management to practical experience. Good wages to the right man. Address, with references,

C. W. Leffingwell, Jr., Whittier, Cal.

SAN FRANCISCO — PORTLAND

The consolidation of dairy interests seems to be the order of the day. All the milk furnished San Francisco milk dealers by dairymen in Alameda, Santa Clara, Marin, San Mateo and Contra Costa counties is now handled by the Bay Counties Commercial Co., who in turn sell to the retailers. This company has raised the wholesale price of milk from ten to fourteen cents per gallon, and guarantees all its milk to be of a certain standard as to quality. In Los Angeles the combination is being made between several of the retailers, with the result that two large concerns, the Belle-Vernon Farms Co., and the Glen-Holly Co., which were formed by the union of several retailers, now control a large part of the milk trade. Prices have been raised, commencing with Sept. 1.

There have been many changes in the dairy business in Oregon in the past year. The establishment of the milk condenseries at Forest Grove and Hillsboro has closed several creameries. It is also changing the methods of the dairy farmers who supply milk to the condenseries. Quantity rather than richness in butter is the thing wanted in producing milk for the condenseries. It is also probable that it pays to produce summer milk rather than winter milk for the condenseries, whereas the reverse has been true in the creamery business. The sale of hand separators has been pushed throughout the state with extraordinary vigor. The large central creameries have been establishing cream gathering routes in many districts which have hitherto produced nothing but "store" butter. The relative proportion of creamery butter has greatly increased. In a number of the older dairy districts the price of feed and the difficulty of securing competent help even at high wages have combined to check the development of dairying and not a few dairymen have reduced the number of cows they keep. When this has been done after proper testing it has actually been a step forward rather than backward. Nothing better for the dairy industry of Oregon could happen than the selection of the poorer third of the dairy cows of the state for sale to the butcher.—Oregon Agriculturist.

Hogs need salt, the same as any other class of stock, and the surest plan is to keep a supply where they can help themselves. A box kept supplied with salt, charcoal and ashes will be of material aid in maintaining good health, and with good health pigs may readily be kept thrifty.

In feeding hogs, either during growth or when fattening, a good feeding floor is necessary. The increased quantity of grain required when fed in mud or dirt to make a pound of gain will soon pay for a tight feeding floor, saying nothing of the better health maintained by having the food supplied in a cleanly manner.

Thousands of patrons of creameries think all this talk about cleanliness of stables, of milk pails and milk cans, and clean habits in milking, are all nonsense. They are ignorant of the destructive habits of dirt in milk. They don't realize how it lowers the value of milk as a food, and the selling price of butter and cheese.

A. B. White of this city, not content without Jerseys, has again started into the business of raising fine bred stock. This week he received the fine bull Sultane's Golden Fern, recently from England. Description and pedigree in another column.

"Hay is worth as much as breadstuffs, these days," says the Nevada County Miner. Hay is scarce and the crop is short, while grazing lands are already denuded.

Kings county is rapidly coming to the front as a dairying county. It has mainly developed this profitable industry during the past five years.

The Jackson-Granger Dairy Company has been incorporated with capital stock at $50,000. Place of business, Alvarado, Alameda county.

The dairying business is rapidly expanding on this coast, especially in Central and Northern California.

BEE SUPPLIES—G. G. Wickson & CO. 123 N Main Street, Los Angeles, Cal.

SULTANE'S GOLDEN FERN, 65,304. IMPORTED.

This son of Golden Fern's Lad has three lines to Golden Lad, and eight to Sultanne P-7-H. C., the foundation of the greatest Island family. Her descendants for many years have won a far greater number of first prizes in dairy tests and in show-ring contests than are traceable to any other blood. Her unspeakable worth is seen in the fact that her name appears in the pedigree of the largest number of animals, and that her blood nicks so successfully with other leading strains, and that this Sultanne blood has been for over twenty years modifying and perfecting the udder and increasing the size, vigor and ability of island-bred Jerseys. Men from England and America have often searched the island for the very best that could be found and have invariably come away with a piece of old Sultanne.

Golden Fern's Lad traces four times to Sultanne and is without doubt the most popular bull of any one that has ever appeared, not excepting his double grandsire, the great Golden Lad. The uniform excellence of his daughters is the wonder of the island, and the admiration of England. They are winners everywhere, and command the highest prices ever attained.

In Africa horses are freely fed on fruits and vegetables, Pumpkins are especially liked by the horse. In Oklahoma they make use of pumpkins and melons for horse feed.

SULTANE'S GOLDEN FERN, 65,304, Imported

Bred by J. Reid Walker, Chestall, Rugeley, Staffordshire. England. Imported by F. S. Peer.

SULTANE'S GOLDEN FERN

SIRE:
GOLDEN FERN'S LAD, P. 2160, H. C. .....
Only four of his sons in service in America; these are Flying Fox, Carnation's Fern Lad, Emanon and Golden Fern's Diploma—all at the head of high class herds.
The greatest sire of prize winners ever on the Island.
Sold for $2,250 at auction.
Sixteen of his get averaged $938 at auction.

DAM:
TRISTESSE, Vol. X., E. H. B.....
Bred on the Island by Mr. J. P. Marett, St. Saviour's, the breeder of Golden Lad.
Milk record—
8 613 lbs. in 1899.
9,642 lbs. in 1900.
Her dam is a half-sister to Golden Lad (said to have been the best daughter of Sultane's Favorite), and a half-sister to Trial. Her sire and dam were grandson and granddaughter of Sultane, P. 7, H. C.

BOYLE, P. 1559, H. C.
Son of Golden Lad.
Sire of most of the celebrated members of the Fontaine family, and many other prize winners.
Dam by Everton King.
GOLDEN FERN, P. 4711, H. C.
Daughter of Golden Lad.
Winner of 2d over Jersey and parish prize, 1894
Dam, a granddaughter of Cetewayo.

GOLDEN HERO, P. 1833, H. C.
Winner of 1st over Jersey and parish prize 1893, 1894 and 1895.
Grandson of Golden Lad.
Son of Bellona 3d, winner of 1st over Jersey, 1889.

Sire of—	lbs.	oz.
Nita Belle D	21	1½
Nicotine's Pet	20	1

SULTANE 14th, P. 3433, H. C.
Milk record—
10,630 lbs. in 1900.
10,295 lbs. in 1899.
Won in 1900, 1st prize and championship at Oxfordshire show; 1st and Lord Mayor's cup in the milking trials; 3d in butter test and Bronze Medal—1 lb. 12 butter from 40 lbs. 13 oz. milk, when 257 days in milk.
Won in 1902, Silver Medal at Tunbridge Wells show: 38 lbs. 6 oz. milk, 2 lbs. 1¼ oz. butter, when 132 days in milk, in her fifteenth year.

SULTANE'S GOLDEN FERN is in breeding a bundle of Sultane blood with crosses thro' the very best sources. He is a brother in blood of the Golden Sultane heifer that fetched at auction $1,600 in 1900, and of Flying Fox, who, two years later, topped the highest auction price for a Jersey, $7,500, and he is closely related to many animals of highest merit whose names cannot be given in this space.
He is a stylish bull one year old, has an elegant frame of perfect dairy conformation, a rich hide and skin, and is marked with white like his sire and most of the noted Island Jerseys. He has the harness on for light service and will remain for the present at Echo Glen Place. Terms reasonable.
A. B. WHITE, NO. 2547 W. 12TH ST., LOS ANGELES

JERSEY BULLS OF ALL AGES
FOR SALE
Melia Ann and Golden Lad blood in lead. Write or come and see.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

THE BROODY HEN.

Broodiness is a condition that nature gives the fowl for rest. It is a natural state for all varieties of poultry, but in some breeds it has been practically bred out. Coupled with the rest is the instinct for motherhood.

The writer has always been a strong advocate of giving fowls the benefit of this provision by nature. They need it. not only for their comfort, health and strength, but for the stamina of the coming generation.

We hold that it is very important that these brood hens be allowed this rest, and when it is not practical to give them eggs for hatching, they should be placed in a pen without a nest, and here allowed to gradually wear off their feverish condition. To use harsh methods, in breaking them up is barbarous, and there should be a law against it; in fact, it is cruelty.

On the farm of the writer a separate house and run are used. Each week a new lot of broodies are placed in these quarters and the old lot removed. It seldom requires more than one week to thus break them up. There are roosts, but no nests in this building. The hens are put in the building at night, and set upon the ground floor. At the end of the week all those that have taken to the roost and do not show any signs of broodiness are removed to the regular pens. In this way we have very little trouble and the hens are greatly benefited.—The Small Farmer.

A feeling prevails that the California poultry shows of this year will show a great improvement over the past. It seems to be in the air—this feeling that the best poultry in the world can be bred in California. And the breeders are here who will take advantage of the condition. Watch the shows for some of the finest birds ever shown on the coast.

THREE QUESTIONS.

Editor Cultivator: Kindly answer in the Cultivator where is the Wilbur Stock and Poultry Food Co. located? Will six months old pullets now beginning to lay moult in the fall? Is ground barley good food for laying hens?—R. A. G., Petaluma.

Answer: The Wilbur Stock and Poultry food may be secured of the poultry supply houses advertising in the Cultivator. Pullets hatched in February usually mouult before winter, those hatched in March and later do not moult in the fall. Ground barley used in moderation is excellent for laying hens, especially for Leghorns.

POULTRY MANURE SHOULD NOT BE WASTED.

Too many farmers fail to realize the importance of properly preserving and disposing of hen manure. Often it is wastefully thrown away or scattered so thickly that it becomes a detriment to growth rather than an aid, or it is stored in barrels, where through the process of heating, much of its fertilizing value is destroyed. The method of caring for and using this valuable fertilizer pursued by Mr. Nat M. Norelius of Washington is a very good one, and may be adopted with profit by farmers or poultrymen.

The cleanings from the henhouse are put in a small covered shed. As the pile grows larger it begins to heat. It is then shoveled over and occasionally a little land plaster is added. After repeated shovelings the pile is reduced to a dry pulverized mass, which can be readily handled. It is used with good results in both orchard and garden. In the orchard, the weaker trees, which have been previously marked, have a pailful of the manure scattered about their base and well raked in in early spring. For potatoes a pailful of manure is distributed to each 100 feet of drill. In strawberry beds, a handful of the fertilizer is scattered around each hill and a similar quantity of unleached wood ashes are applied later. For corn, melons and squashes, a small amount is put in each hill at the time of planting.—Orange Judd.

POULTRY SHOWS.

Poultry shows as announced for this year are:

Mechanics' Pavilion, San Francisco, Cal., December 1-5, 1903, under management of the Oakland Poultry Association. J. C. Williams, Secretary, 33 Market St., San Francisco.

Los Angeles, Cal., December 8-12, 1903.—Annual Exhibition L. A. Poultry Association. H. W. Kruckeberg, Secretary, 123 S. Los Angeles St., Los Angeles, Cal.

Fresno, Cal., December 16-19, 1903. —Annual Exhibition Fresno Poultry Association. Geo. R. Andrews, Secretary, Fresno, Cal.

San Diego, Cal., January, 1904.—The San Diego Poultry and Pet Stock Association. Harry McIntire, Secretary, San Diego.

IDEAL CONDITIONS.

California offers ideal conditions for poultry raising. It is a known fact that all fowls, both old and young, thrive on green foods.

No state in the Union produces a greater variety of grasses and vegetables, and the fact that they grow and are cultivated the year round, cheaply and in great abundance, gives the California poultryman a decided advantage over eastern breeders.

Not only is this true of green foods, but the many varieties of grain of the best quality and mill products are grown, manufactured and sold at less cost than in many other states. This fact taken in connection with our excellent markets and steady demand explains in a measure, the success of our poultrymen, and should be an incentive to many to enter into this business, particularly those possessed of limited means and small tracts of land.

If these facts were properly placed before the people of this state, and of the United States, the importation of poultry and poultry supplies would cease.

Many eastern poultrymen who are put to endless trouble and great expense in preparing for the changes in seasons would investigate and surely avail themselves of these advantages in climate, soil, markets and productions.

Owing to the mild cilmate in this State it is not necesary to build elaborate air-tight buildings, such as are in use in eastern States. Any ordinary frame building with water-tight roofing answers.

It is an acknowledged fact that fowls raised in colder climate do not lay as many eggs as our California fowls.—San Jose Mercury.

Cholly Oumpleigh—I say, Doc, don't-cherknow, my eyes are weak.

Dr. Krusty—No wonder. They're in a weak place.

Where Poultry Supplies Are Handled by the Carload

The A. R. Coulson Co., Petaluma, Cal.

SO SUCCESSFUL

Has been the sale of Coulson's Poultry Medicines and Poultry Foods, etc., that on August 25 a company was incorporated for $25,000.00 and only $5,000.00 worth of stock remains to be sold. The balance has been paid in. The name of the company will be A. R. Coulson Company and the headquarters and principal factories will be at Petaluma. The company is incorporated for a term of fifty years and will manufacture, buy, sell and deal in merchandise of every description. The number of its directors shall be five, of which A. R. Coulson is president. The amount of capital stock actually subscribed is as follows:

NAME	RESIDENCE	AMOUNT
A. R. Coulson	Petaluma	$9,000.00
Lucinda Coulson	"	1,000.00
R. M. Skinner	"	100.00
Helen M. Skinner	"	4,900.00
J. Hall Lewis	"	1.00

SUCCESS INSPIRES CONFIDENCE

Our success was immediate, That the confidence of our earliest customers was not misplaced is shown by the rapid growth of our business. Today we point with pride to the best equipped establishment of its kind on the Pacific coast, occupying over 5,000 feet of floor space, in California's famous poultry city, Petaluma. Here we manufacture medicines, extracts, etc., but our principal output is poultry medicines and balanced rations for poultry and stock. We send out from 10 to 15 carloads of poultry food a month.

A larger amount of Coulson's Poultry Food is used by the poultry men near Petaluma. Many of the poultry men haul to their ranches by the 4-horse wagon load. For instance: Geo. Gaston at Two Rock has 2500 laying hens and feeds them a mash every morning of Coulson's Egg Food, using over 50 sacks a month of it, and has been feeding it for over a year with good results; W. Church, who has about 3,000 chickens; C. C. Boyson, who has about 3,000; and Mark Hardin, who has about 3,000, all use big loads of this feed with good results. Many of these large ranches near Petaluma are commencing to hatch out large broods of young chicks and they feed them Coulson's Growing Chick Food, which is a complete balanced ration food for little chicks, being composed of grains, seeds and meals, etc., all thoroughly and properly mixed ready to feed.

IF YOU ARE GOING TO RAISE ANY LITTLE CHICKS

You surely want to get in a few sacks of Coulson's Chick Food. A free sample will be sent for the asking. Over 125 stores in California now handle Coulson's Poultry Foods, but in case no one has it for sale in your town, you can send to factory and get factory prices and have it shipped to you by freight. We will soon have ready for free distribution 10,000 copies of illustrated catalogue and poultry account book and egg record, a nice book to keep accounts of the profits or losses from the poultry business. We can also supply you with White Leghorn eggs for hatching in any quantity at a little above market quotations. We also manufacture Lice Killers and Poultry Disinfectants and Medicines and if you want good Poultry Supplies at small cost send to us or ask your dealer for Coulson's Poultry Foods.

HOW TO MOVE FOWLS SUCCESSFULLY.

During the months of September and October most all of our fowls will put on their new plumage, and during this process of molting much can be done by the fancier to not only help out but hasten the matter and increase the beauty of the plumage to such an extent as is almost surprising to those who do not know that this is possible.

When the birds are on the range and can roam where they please they will provide for themselves all necessary material out of which feathers are made, but when in confinement all this material must be supplied by the poultry keeper.

Use good wholesome food given at regular intervals and enough of it and of such kind as is needed. There is no time when a meat ration is so necessary as during this period. Besides care and good feeding, we may at this time supply the pigments necessary to produce the gloss and rich deep coloring so desirable in exhibition birds.

To each three birds take a teaspoonful of flowers of sulphur and mix in the soft food on bright, warm days, three times a week, and on alternate days a teaspoonful of carbonate of iron to a dozen fowls, but don't give the iron to white plumaged birds, as the tendency is to yellow the plumage. Where the birds are kept purely for utility purpose and the plumage doesn't matter, it will, when given as above, facilitate the molt to such an extent that you can almost see the feathers unfold themselves. If this treatment is kept on during the entire molt, the birds will get through easily, as there will be no loss of strength, nor will any of them hang in the molt, but keep on until completed.

Now, if you desire to have an exceedingly fine plumage, keep the birds in a place partly dark, that is, where there will be no strong sunlight. Feed a little linseed oil when you feed the carbonate of iron and you will be surprised to see the beautiful black with that rich greenish tint so much desired. In the buff varieties it deepens the color and you will never find that "washed out" looking plumage so often seen. It (the carbonate of iron) is absolutely harmless and can be fed as directed without any bad results whatsoever. It appears to have the property of forcing into the feathers whatever coloring properties the bird has in its body, and which are deposited in cells especially constructed to contain them, but it must be administered during the molt or it is useless.

We, of course, take it for granted that the fowls are free from vermin and that their quarters are kept scrupulously clean, for this also is a factor of a successful molt, and if there is no green food growing in the yards then it must be supplied in plenty—American Poultry Journal.

CHARCOAL.

Permit me to urge all breeders of poultry who wish healthy fowls to be liberal in supplying their birds with charcoal. It is one of the best preventives of disease and purifiers of the animal system we have, or at least that we know of. It helps to purify the digestive organs and acts as a stimulus by purifying the blood and toning up the system in general. It does not need to be crushed fine, mix with other food and compel them to eat it, but all that is necessary is to break it up in small pieces convenient for them to swallow. They will produce more eggs if they have plenty of charcoal of easy access. The cost of charcoal is but a trifle, even when bought, and if you burn wood in your stove the fire ashes may be sifted out and the black coals saved and pounded in pieces about the size of a grain of corn and placed in small piles, where the fowls can get it easily. It is especially valuable during the spring and summer months, for then it is that the blood is sluggish and needs something to purify it, and it is from this reason, principally, that most of the poultry disease come during these months.—Up to Date.

A. T. Lindgren of Kingsbury informs us that it is entirely probable that California poultrymen will exhibit at least a carload of fine bred birds at St. Louis next year. Mr. Lindgren will make an effort to capture a Buff Leghorn prize. He has some remarkably fine birds of that breed.

A SINGING LESSON.

A nightingale made a mistake—
  She sang a few notes out of tune—
Her heart was ready to break,
  And she hid from the moon.
She wrung her claws, poor thing,
  But was far too proud to weep;
She tucked her head under her wing,
  and pretended to be asleep.

A lark, arm in arm with a thrush,
  Came sauntering up to the place;
The nightingale felt herself blush
  Though feathers hid her face.
She knew they had heard her song,
  She felt them snicker and sneer;
She thought that this life was too long,
  And wished she could skip a year.

"Oh, nightingale," cooed a dove,
  "Oh, nightingale, what's the use?
You a bird of beauty and love,
  Why behave like a goose?
Don't skulk away from our sight
  Like a common contemptible fowl;
You bird of joy and delight,
  Why behave like an owl?
"Only think of all you have done,
  Only think of all you can do;
A false note is really fun
  From such a bird as you!

Lift up your proud little crest;
  Open your musical beak;
Other birds have to do their best,
  But you need only speak."

The nightingale shyly took
  Her head from under her wing,
And, giving the dove a look
  Straightway began to sing.
There was never a bird could pass—
  The night was divinely calm—
And the people stood on the grass
  To hear that wonderful psalm.

The nightingale did not care—
  She only sang to the skies;
Her song ascended there,
  And there she fixed her eyes.
The people who listened below,
  She knew but little about—
And this tale has a moral I know,
  If you'll try to find it out.

JOHNNIE'S PA.

My pa—he always went to school,
  He says, an' studied hard.
W'y, when he's just as old as me,
  He knew things by the yard.
Arithmetic? He knew it all,
  From dividend to sum;
But when he tells me how it was,
  My grandma she says "Hum!"

My pa—he always got the prize
  For never bein' late;
An' when they studied joggerfy
  He knew 'bout ev'ry state.
He says he knew the rivers, an'
  Knew all their outs and ins,
But when he tells me all o' that,
  My grandma, she just grins.

My pa—he never missed a day
  A-goin' to the school,
An' he never played no hookey, nor
  Forgot the teacher's rule;
An' ev'ry class he's ever in
  The rest he always led.
My grandma, when pa talks that way,
  Just laughs and shakes her head.

My grandma says 'at boys is boys,
  The same as pas is pas,
An' when I ast her what she means
  She says it is "because."
She says 'at little boys is best
  When they grows up to men,
Because they know how good they were
  And tell their children then.
—Josh Wink in Baltimore American.

UNCLE DICK'S LITTLE GIRL.

Uncle Dick reached up to the apple tree above him, and pulled a long, sinuous bough, picked out with delicate, rose-hearted bloom, down to him, with a caressing motion. Through the little gap thus made in the big pyramid of blossom was seen a far-away glimpse of the harbor on the western side of the Four Winds peninsula. The sun had lately set, and the harbor was like a great ruby cup filled with fire and glamor. On the other side of the orchard long fields, fresh with the tinting of early spring, sloped down to the shore of the open Atlantic, long and white, where a calm ocean slept bluely and sighed in its sleep with the murmur that rings forever in the ears of those whose good fortune it is to have been born within sound of it. Back landward were the wooded pine hills where the twilight was already hanging thickly and would presently overflow and trickle down on the lowland homesteads and orchards of Four Winds. But the harbor glow would linger long, and it was always a sight worth seeing when the great stars came out in the clear-swept arch of sky above it, like jewels in some huge, overturned crystal flagon of night.

"When these blossoms have given place to fruit, I'll have my little girl with me again," said Uncle Dick tenderly.

He looked through the boughs to the harbor, and his gentle brown eyes filled with a light that was not of the sun set or the lustrous water. The smile that came to the sensitive lips, veiled in the sweep of a silken, silver-sprinkled brown beard, told that Uncle Dick's thought was a very pleasant one.

Two of his listeners smiled at each other—the tolerant significant smile which expresses our slightly amused recognition of some harmless fallacy in our friends.

Do you really expect that she'll come back to Four Winds after all these years, Uncle Dick, and her such a great lady now?" said Martin Baker, perhaps thinking it wise to soften any blow the near future might have in store for this Uncle Dick, whom everybody in Four Winds loved, even those who, safe in their hard shell of protective common sense, laughed in a not unkindly fashion at his dreamy fancies and odd ways.

Uncle Dick released the apple bough and it swung back into its place with a gush of perfume that flooded the cool air like a wave.

"I know she will come," he said calmly. "Bertha Lawrence never forgot nor broke a promise in her life. Two years will have made no difference in her in that, at least."

"Even so," said Christopher Merriam, "ain't you afraid that she won't be happy or contented here, Uncle Dick? Seven years makes a good deal of difference in folks—'specially seven such years as she has spent, living with rich people and traveling abroad and all that."

Uncle Dick looked at the last speaker tolerantly. A humorous sparkle replaced the musing light in his eyes and his smile was half quizzical.

"I don't think you need be worrying over that, Christopher. I'm not. None of you really know my little girl, although she lived among you fourteen years."

He spoke in a tone of quiet confidence. Merriam and Martin, after a few more casual remarks, strolled away, and Uncle Dick was left with Phillip Armory, the young minister of Four Winds church, whose manse was just across the road from Uncle Dick's place, and who had fallen in the habit of straying over often to talk with this high-souled, simple-minded old man, with the eternal youth in his eyes and heart.

Mr. Armory was sitting on the stone wall under the huge apple tree. When the other men had gone, his blue eyes met Uncle Dick's brown ones with quiet comprehension.

"They're laughing at me, those two," said Uncle Dick with a smile. "They're thinking now, and most likely saying, 'What a fool that old Dick Romney is over his little girl! She'll never come back.' But I don't blame them. They just don't know her, that's all, they just don't know her."

He came over and leaned against the mossy stones. The twilight was thick about them now, and the apple blossoms were dizzily sweet in the dew.

"I don't know her, either, said Philip Armory, gently, "but I think she will come back to you."

Uncle Dick nodded.

"Folks thing I'm foolish because I talk so much about my little girl. I don't talk half so much about her as I think. I'm thinking of her always—have been ever since she went away seven years ago. She's been in my heart all the time, and I've been in hers! Don't I know? What does it matter that she doesn't write very often, or speak of coming back when she does write? I know she'll come. She'll keep her promise and keep it gladly, too. If I didn't know that I wouldn't want her to keep it at all."

"How was it she came to leave you?" asked Armory. I don't think I've ever heard the rights of the story."

"I had a sister, once, said Uncle Dick, gently. "She was beautiful and good. She married a fine fellow, too, but he took her away from us. He died soon after Bertha was born, and

my sister came home and died, also, of grief. She gave her baby to me with her latest breath. That can't never be undone. Bertha was her mother's gift to me—to me. There's nobody had a right before that. But her father's will had left her under the guardianship of his own people. They wanted to take her away at once, but I pleaded hard for her, and they agreed to leave her with me till she was 14. Then they took her away. It most broke her little heart. When she went away she took my hand in both of hers in a way she had, and she looked up at me with her whole lovely, pure soul shining out of her great eyes, and she said: 'Uncle Dick, as soon as I am 21 I'll come back to you.' I've never seen her since. They won't even let her write me often. But I am content. Bertha will be 21 in September, and she will come back to me then."

Perhaps a shade of doubt showed itself on the younger man's face. Uncle Dick detected it and laughed in his low, gentle fashion.

"You don't feel so sure? You've heard of her cleverness and her beauty, and what they call her social triumphs? Yes, yes, but you'll see! they'll all see."

As Phillip Armory walked home through the purple, softly-scented dusk he recalled all he had heard of Bertha Lawrence. The thought of her had been curiously interwoven with his life and dreams since he had come to Four Winds a year ago. He believed in her, but not quite with Uncle Dick's entire faith. She would come back, but would she be soul-free? Would the life here satisfy her now? Between the child of 14, knowing no home save Uncle Dick's gray old cottage, and the woman of 21, who had spent her seven formative years amid all that wealth and culture can give what unbridgable gulf might not yawn?

"I hope there is no disappointment in store for Uncle Dick," thought Armory, tenderly. "I have never met a purer, sweeter soul."

As the summer waned, Uncle Dick talked less about his little girl than was his wont. His Four Winds neighbors said that he was growing doubtful himself, but Philip Armory knew better. He knew how Uncle Dick was counting the slow-passing days, and his heart was troubled with the fear that there was some sorrow in store for the sweet old man.

"She will not come—or, coming, will be changed," was his unuttered doubt.

But Uncle Dick remained untroubled. His eyes were always tranquil and happy when he spoke of her, as he often did to Philip.

"Merriam was here today, Mr. Armory. He said he s'posed I'd soon be fixing up the house and getting ready for Bertha. I said no. She would find it as she left it, and it would satisfy her. The Four Winds folks laugh at me and I at them.. I know her; they don't, you see. That makes all the difference."

A great, although quiet change had come over Uncle Dick in these purple-hearted days of the late summer. He went about humming scraps of old-time songs, his step was lighter, his deep, kindly voice had a new and richer note of tenderness. He liked to linger in his orchard at twilight and dream of his little girl. Armory, who often walked there with him, forebore by word or motion, to interrupt his charmed reveries. He walked beside him, suiting his younger, stronger step to the old man's. Sometimes Uncle Dick patted his friend's arm and laughed softly. "What a nuisance the old man is, isn't he?" he asked whimsically. "Old dreamer! But, ah, you don't know my little girl Mr. Armory."

"I hope you will know her," he said again; "not as her fashionable world knows her—nor yet as these well-meaning, stupid Four Winds folks know her, but as I know her, in all of her beautiful woman's soul, and her noble, loyal little heart. She will be worth knowing. Her mother was a queen among women."

One evening Uncle Dick came to meet Armory with an almost boyish lightness of step; in his eyes was a glow and brightness. He held a letter in his hand.

"Writ on her 21st birthday," he exclaimed. She will be here in a week's time, God bless her!"

On a September day, when Four Winds in its ripely tinted breadth and length lay basking in the mellow autumn sunshine that spilled over the brim of the valley, through the grim old pines, down to the harbor, cupped in its harvest-golden hills, Bertha Lawrence came home. All Four Winds knew it by night. Philip Armory did not make his customary evening call on Uncle Dick. For one thing, he feared to intrude on the sacredness of this reunion; for another, he was still troubled by the thought that he might see something besides gladness in his old friend's eyes—some perplexed shade of doubt or fear, some token that his dream lacked perfect fulfillment.

But when he went over the next evening he understood that his fear had been needless. Uncle Dick had been right—he, and only he, had thoroughly known his little girl.

They were in the orchard, those two, among the bronzing leaves and hanging boughs bent earthward by their mellow burden. They came to meet him slowly, through a long avenue of fruition, with an arch of primrose sky at its seaward end.

Uncle Dick's face was an open book written over with unmarred triumph and happiness. Armory was quick to see that there was no shadow in the old man's eyes, and equally quick to realize that, as far as the girl at his side was concerned, there never would be, Bertha Lawrence had come to her own.

She was very lovely—lovelier than even rumor had painted her—this tall, graceful girl, with the dark, finely-poised head, and the clear, untroubled gray eyes. Apart from her loveliness she had the distinctive charm, feminized and subtilized, that Armory had come to associate with Uncle Dick.

She held out her hand with a gesture of fine, frank friendship.

"This is my little girl," said Uncle Dick, proudly.

"You have justified his faith in you," said Armory to her with a smile.

"Any one in whom Uncle Dick believed would do that," she answered. "His faith is of that rare kind which carries its own fulfillment."

She turned and held out her hand to Uncle Dick with a sudden, girlish delight that broke through her womanly calm like a gleam of sunlight rippling over a placid sea.

"Oh, how happy I am!" she said. "Everything here is so dear—and you, Uncle Dick, are the dearest of all."

Uncle Dick took her hands softly in his own.

"My little girl!" he murmured tenderly.

Armory turned away his head as if from some glimpse of soul communion too holy to be desecrated by stranger eyes. But on his face was the light of one who sees a great glory widening and deepening down the vista of his future.—Orange Judd Farmer.

RECIPES.

Doughnuts—One egg, cup rich milk, cup sugar, three pints flour, three teaspoons baking-powder (or one and a half meausures Horsford's Bread Preparation). These are made richer by adding one egg, and one teaspoon butter.

Sugared Doughnuts.—Try this way of sugaring doughnuts. Take a medium-sized clean paper bag, into it put three or four doughnuts and two tablespoons of pulverized sugar. Close the top of the bag by holding tight in the palm of your hand and shake the cakes back and forth once or twice. On taking them out you will find them more evenly and beautifully coated than can possibly be done by the sifting process. Two tablespoons of sugar will coat about one dozen cakes. If any sugar remains in the bag after you are through lay away and use again next time—Mary C. Wood.

Tapioca Cream—Soak over night two table-spoons tapioca in one-half tea-cup milk, or enough to cover; bring one pint milk to boiling point; heat well together the yolks of three eggs, half tea-cup sugar, one teaspoon lemon or vanilla for flavoring, add the tapioca and stir the whole into the boiling milk, let boil once, turn into a dish, and immediately spread on the whites. Serve when cold.

Chili Sauce.—Twelve large ripe tomatoes, four ripe or three green peppers, two onions, two tablespoons salt, two of sugar, one cinnamon, three cups vinegar; peel tomatoes and onions, chop (separately) very fine, add the peppers (chopped) with the other ingredients, and boil till it thickens. Bottle and it will keep a long time. One quart of canned tomatoes may be used instead of the ripe ones. This Chili sauce is excellent and more healthful than catsups.

HOMELY HINTS.

A fever patient can be made cool and comfortable by being frequently sponged with water in which a little soda has been dissolved.

Brasswork can be kept beautifully bright by occasionally rubbing with salt and vinegar.

For insomnia a glass of hot milk, or, better still, hot malted milk, taken just before retiring, will often have the desired effect.

After touching poison ivy wash the parts exposed in alchohol and avoid anything greasy.

A very complete filling for open cracks in floors may be made by thoroughly soaking newspapers in paste made of one pound of flour, three quarts of water and a tablespoonful of alum, thoroughly boiled and mixed. Make the final mixture about as thick as putty, and it will harden like paper mache.

Every sauce containing butter and flour is made after the same formula. Melt the butter, add the flour and cook to a paste, then add whatever liquor is required, milk, stock, strained tomato or cream, and cook, beating constantly. The result will be a smooth, creamy sauce.

Macaroni or spaghetti will be much tendered if put in cold water and slowly brought to a boil than if dropped raw into boiling water.

In baking puff paste, have a very hot oven and have the heat come from below until the paste is risen as high as it will go. Then allow it to brown, setting it on a higher grate if necessary.

Raisins ought never to be washed for a pudding, or it will be heavy. Rub them clean between dry towels.

GIANT SOAP BUBBLES.

Here is a way to make soap bubbles as big as the biggest pumpkins that you ever saw, and so tough that they will roll about over the carpet for ever so many minutes before they think of breaking: Into a pint of warm water shave a piece of brown laundry soap about an inch square containing a good proportion of lye. When this is thoroughly dissolved add a tablespoonful of gum arabic and stir till melted. Then a teaspoonful of glycerine is necessary, and lastly a quart of cold water.

If the bubble makers are not very little people and know how to keep the water out of their mouths, wonderfully colored bubbles can be made by separating this mixture into cups and adding a pinch of different dyes to each. But for little people strawberry or currant juice for pink bubbles, and orange juice for yellow, are perhaps safer. The lye in the soap plus the glycerine increases the brilliancy of the bubbles, and the gum gives them elasticity. Hot water is necessary to dissolve the various ingredients, but unless cold water is added they expand and break too rapidly in the cooling process.—Poultry Journal.

POULTRY—Old Roosters, per dozen, $4@5; young Roosters, $4.50@6; Fryers, $3@4; Broilers, large, $2.50@3.50; small, $2@2.50; Hens, $4@5.50; Ducks, per doz., old, $3@4; young, $3.50@4.50. Turkeys, nominal; Geese, per pair, $1.50; Goslings, $1.50@1.75; Pigeons, per doz., $1.50@1.75; do, old, $1.50.

Fruits and Vegetables.

Fancy four-tier apples command top quotations and are in great demand. Small fruits are abundant, and seldom command top quotations. Fancy peaches are kept fairly well cleaned up, most sales command full quotations. Table grapes in crates are in good demand and some extra fine tokays are in the market. Good Muscats also sell readily. The small seeedless grape is not in such good demand, and large stock is on hand. The wine grape market seems to be paralyzed by the winery combination fixing on such low prices and long time payments. Bartlett pears are practically the same as last week, the market being fairly easy. Cantaloupes, nutmegs, and watermelons are in good demand with supplies much lower than last week. Citrus fruit is becoming more scarce which applies especially to limes and lemons. A fresh consignment of limes is expected.

VEGETABLES.

Potatoes show a decided decline from last week's quotations, large quantities having been received. The demand for shipment seems to be at a low ebb. It is claimed that outside markets report stock selling below San Francisco prices. Sweet potatoes are in fair request at full quotations. One carload of Merceds sold readily at $1.85. The vegetable market shows no particular variance. Tomatoes are in good demand and sell at full quotations. Choice green corn commands top rates.

APPLES—Per box, common to choice, 25@75c; fancy, 85c@$1.25; Crab apples, per box, 40@75c.

PEACHES—Per box, 50@85c; carriers, 50@75c; large open boxes, 65c@$1; bulk per ton, Clingstones, $20@27.50.

PEARS—Per box, No. 1 Bartlett, $1.25@1.50; common, 75c@$1; other varieties, per box, 40@85c.

PLUM AND PRUNES—Per box or crate, 40@60c; large open boxes, 65@85c; bulk, per ton, $20@25, as to variety.

FIGS—Per box, 25c@$1.

CANTALOUPES—Per crate, 75c@$1.50.

NUTMEG MELONS.—Per box, 35@60c.

WATERMELONS—Per 100, 35@60c.

GRAPES—Per small box, 25@65c; crate, 50@85c; large box, 50c@$1, as to variety; Wine Grapes, per ton, zinfandel, $24@25.

NECTARINES—Per box or crate, 75@85c.

POMGRANATES—Per box, 65@85c.

QUINCES—Per box, 40@65c.

BERRIES—Per chest: Strawberries, Longworth, nominal; large varieties, $2.50@5; Blackberries, $3@4.50; Raspberries, $$5@8; Huckleberries, per lb., 7@8c.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal, as to quality; Valencias, $1.25@2.50; Lemons, 75c@$2.50; extra, $3@3.50; Grape Fruit, $1@2; Limes, $6.

VEGETABLES—Tomatoes, per box, river, 40c@75; do, bay, 50@85c; Green Peppers, per box, Bell, 25@40c; Chile, 25@40c; String Beans, per lb., 2@3c; Wax, 2@3c; Lima, per sack, 75c@$1.25; Green Peas, per lb., 2½@3½c; Egg Plant, per box, 35@50c; Summer Squash, per box, 25@40c; Garlic, per lb., 2@3c; Green corn, per sack; 75@$1.50; crate, 75c@$1.75, Okra, per box, 35@50c; Marrowfat Squash, per ton, $10@$$12.50; Cucumbers, per box 25@40.

ONIONS—Yellow, per ctl., 50@70c.

POTATOES—Per ctl.: River Burbanks, 60c @$1; Early Rose, nominal; Salinas Burbanks, $1@1.50; Sweet Potatoes, $1.75@2 25.

Dried Fruits, Nuts, Etc.

Regarding the Dried Fruit market, the San Francisco Chronicle says:

Trading in Dried Fruits is steadily improving and general market conditions are now in excellent shape for the selling interests. Prunes are in sharper demand and the market is firmer, although quotably no higher. Bids are being more freely offered well up to the quoted basis prices, and holders are displaying some little indifference in parting with their stocks. The supplies of old-crop Prunes have been greatly reduced within the last few weeks, which has greatly strengthened the position for the new yield. Speculative buying of Peaches, Apricots and Pears continues brisk and full figures are being obtained for the desired stock. The new prices for Raisins has not caused any future trading as yet, the traders awaiting the prices to be named by the associated seeders. Honey is in liberal supply and fairly steady at quotations.

DRIED FRUITS—Prices for carload lots, f. c. be. at California common shippling points, in bags for 1903 crop, are, per lb., as follows:

APPLES—Evaporated, 5@6c; Sun Dried,

APRICOTS—Royal, fancy, 9@9½½c; choice, 7½c@8½c; Moorparks, choice, 9@11c.

PEACHES—Choice, 5¼@6½c; fancy, 7@7½c; peeled. in boxes, nominal.

PEARS—Choice, 6@7c; fancy, 8@9c.

PLUMS—Pitted, 5@7c; unpitted, 1@1½c.

RAISINS—Prices by the California Raisin Growers" Association on standard brands, 1903 crop. f. o. b. at common shipping points, are as follows: Loose Muscatels, two-crown, 6@6¼c; three-crown, 6¼@6½c; four-crown, 6¾@7c.

NUTS.—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian. nominal.

HONEY—New Comb, per lb., White, 12@13c; Light Amber, 11@12c; Extracted Water White. 6@6½c; Light Amber, 5½@6c; Dark Amber, nominal.

BEESWAX—Per lb., 30c.

Live Stock.

With supply and demand evenly balanced there is no change in the last week's market conditions.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin steers, 6½@7c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½@4c, gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb; Hard grain-fed, weighing alive, 140 lbs and over, 5¾@6c; weighing under 130 lbs, 5¼@5½c; weighing 260 to 350 lbs, 5½c; rough heavy, 4½@5c.

BUTCHERS' PRICES.

Retail quotations for Meats, as furnished by the San Francisco Retail Butchers" Protective Association, are as follows:

BEEF—Prime Roast, 15@18c; Porterhouse Steak, 18@22½c; Tenderloin Steak, 15@18c; Sirloin Steak, 12½@15c; Top Round Steak, 12½c; Beef Stew, 10c; Corned Beef, 8@10c; Soup Meat, 4@10c.

MUTTON—Leg, 15c; Shoulder, 10@11c; Stew. 8@10c; Prime chops 12½@20c.

SPRING LAMB—Chops, 25c; Hindquarter, $1.25@1.50; Forequarter, $1@1.25.

PORK—Loin Roast, 15@18c; Leg Roast, 12½@14c; Shoulder Roast, 10@12½c; Chops, 15@18c.

VEAL—Loin Roast, 15@20c; Shoulder Roast, 12½@15c; Chops or Cutlets, 15@20c; Stew, 12½@15c.

Hay and Feed Stuffs.

HAY—Prices on new Hay, per ton: Wheat, $11@15; Wheat and Oat, $10@13; Oat, $9.50@$12.50; Barley, $8.50@11; Clover, $9@10; Alfalfa $9@11.50; Stock, $8@9.

STRAW—Good to choice, per bale, 45@60c.

FEED CORN MEAL—Choice grades, per ton, $33@34.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $27@29.

BRAN—Per ton, $23.50@24.50.

GROUND BARLEY—Per ton, $23@24.

MIDDLINGS—Per ton, $26.50@28.

BRAN—Per ton, $23.50@24.50.

CRACKED CORN—Choice quality, per ton, $33.50@34.50.

BARLEY—New crop: Choice, No. 1 Feed, $1.11¾@1.13¾; Shipping, $1.15@1.18¾; Brewing, No. 1, $1.20@1.25; Chevalier, $1.35@1.50.

OATS—Feed, good to choice White, $1.22½@1.32½; White Milling, $1.32½@1.37½; Red, $1.20@1.35; Black, $1.15@1.25 for Feed and $1.35@1.50 for Seed.

Beans—Prices per ctl; Large whites, $2.90@$3.10; small, do, $3.10@3.25; Pea, $3.40@3.50; Lima, $3.40@3.55; Red, $2.90; Pink, $3@3.10; Bayo, $3.40@3.65; Blackeyes, $2.75@3.10; Red Kidneys, nominal.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

COCOANUT CAKE—Best quality, in lots of ten tons and upward, $20 per ton; 5 tons, $20.50; small quantities, $21. Prices are mill rates and are subject to change without notice.

Cereals.

BARLEY—New crop: Choice, No. 1 Feed, $1.13¾@1.16¼; Shipping, $1.16¼@1.20; Brewing, No. 1, $1.20@1.25; Chevalier, $1.35@1.50.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.55@1.60; small, do, $1.75@1.80; white, $1.55@1.60.

RYE—Good to choice, per ctl: $1.20@1.25.

OATS—Feed, good to choice White, $1.22½@$1.32½; White Milling, $1.32½@1.37½; Red, $1.20@1.35; Black, $1.15@1.25 for Feed and $1.35@1.50 for Seed.

BEANS AND SEEDS.

Yesterday's business in Beans was somewhat of a holiday character and the general market was devoid of feature. There are several shipping orders at hand, and these have a strengthening influence upon values for present holdings. The arrivals of new-crop offerings are still limited to small quantities, which seem to have no depressing effect upon the general market. Seeds are largely nominal in price.

BEANS—Prices per ctl: Large Whites, $2.50@$2.85; small do, $2.75@3; Pea, $3.25@3.50; Lima, $3.25@3.50; Red, $2.90@3; Pink, $2.85@$3.05; Bayo, $3@3.40; Blackeyes, $2.50@2.85; Red Kidneys, nominal.

New Crop—Large White, $2.50@2.75; Blackeye, $2.50@2.75.

Hops.

The price for new crop is 22@23c per lb, according to quality.

CHOICE OF 3 ROUTES

EAST AND WEST

"SUNSET" Via El Paso and New Orleans

"OGDEN" Via San Francisco and Portland

"SHASTA"

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

Eastern Markets.

Grain and Produce.

CHICAGO, Sept. 9.—Wheat showed but little activity at the opening today, and while it sold higher, influenced by firmer cables, it soon suffered a reaction on favorable advices from abroad and liberal receipts at primary points. December showed a gain of ⅛ to ¼ at 82, but dropped to 81⅝ under pressure of the local selling. The close was firm, with December ⅛ higher, at 82¼@82⅜, after having sold ⅛ higher on the bulge. The failure of predicted frosts to occur in the corn belt, together with easier cables, caused a weak start in corn, with local traders liberal sellers. Later in the session the upturn in wheat, with renewed predictions of frosts tonight and excessive rains, started prices upward, and the close was firm, with December at 51⅝, having sold up from 50⅝. Oats were very steady, although responding in some degree to the early slump in other grains. Commission houses were free buyers at times. December closed ⅝ higher, at 37½. The demand for provisions was exceedingly active, and prices showed a good advance throughout the list. Investment buying in October pork at one time sent that product up nearly $1 over yesterday's close. Final sales were at an advance of 62½. at 13.60. October lard closed 25 to 30 higher, at 8.30, while ribs were up 10 to 20, at 8.10.

Cash quotations were as follows: Flour was firm; No. 2 red wheat, 80½@82½; No. 2 corn, 51⅝; No. 2 yellow, 52⅞; No. 2 oats, 33½@34½; No. 3 white, 37@37⅛; No. 2 rye, 56½; good feeding barley, 47@49; fair to choice malting, 52@53.

New York General Market.

NEW YORK, Sept. 9.—Wheat—Spot steady. Options closed firm at ¼@½ net advance. May closed 89; September closed 87⅝; December, 88. Hops, firm; Pacific Coast, common to choice, 1902 crop, 21@26½.

Grain Movements.

Articles—		Receipts.	Shipments
Flour,	barrels	19,864	3,240
Wheat,	bushels	177,600	58,500
Corn,	"	1,231,000	230,255
Oats,	"	356,700	508,145
Rye,	"	5,700	900
Barley,	"	142,000	1,540

On the Produce Exchange today the butter market was steady; creamery, 15@19½; dairy, 13@17; eggs, firm, 17@18; cheese, steady, 10@11¼.

Chicago Live Stock.

CHICAGO, Sept. 9.—Cattle—Receipts, 18,000, including 2000 Texans; market steady to strong; good to prime steers, 5.40@6.10; poor to medium, 4.00@4.25; stockers and feeders, 2.50@4.15; cows, 1.50@4.40; heifers, 2.00@4.75; canners, 1.50@2.60; bulls, 3.00@4.50; calves, 3.50@6.75; Texas fed steers, 3.25@4.50; western steers, 3.25@4.60. Hogs—Receipts, today, 21,000; tomorrow, 20,000; market strong; mixed and butchers, 5.40@6.15; good to choice heavy, 5.70@6.00; rough heavy, 5.30@5.65; light, 5.80@6.20; bulk of sales, 5.60@6.50. Sheep—Receipts, 25,000; sheep and lambs steady to 10c lower; good to choice wethers, 3.25@3.75; fair to choice mixed, 2.25@3.00; western sheep, 2.75@3.50; native lambs, 3.75@5.85; western lambs, 3.75@5.25.

California Dried Fruits.

NEW YORK, Sept. 9.—The market for evaporated apples is quiet and unchanged under a light demand. New fruit is arriving in small amounts, but is usually of a poor quality and is moving too slowly to establish a range of quotations. Futures are weak, with prime for October and November delivery quoted at about 5½@5⅝; common are quoted at 4@5; prime, 5¼@5¾; choice, 6@6½; fancy, 6¾@7½. Prunes are steady to firm, at from 3¼ to 7 for all grades. Apricots are firmly held; choice, 9¼@9¾; extra choice, 9½@10¾; fancy, 11½@12. Peaches are steady; choice, 7¼@7¾; extra choice, 7¾@8¼.

ST. LOUIS WOOL MARKET.

ST. LOUIS, Sept. 9.—Wool quiet; medium grades, combing and clothing, 16@21; light fine, 15@17½; heavy fine, 11@14½. tub washed, 20@30; territory and western mediums, 17@18; fine medium, 15@17; fine, 15@16.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

The auction markets the past week have shown a little better prices on good stock; sound, fair quality choice have brought quite satisfactory prices and a little extra fancy stock high prices. The supply in sight at the different auction points is small and the situation and market somewhat stronger. Cooler weather and less abundance of deciduous fruits are having a little effect. Western markets have been very slow, taking a few cars only. Desirable sizes are scarce and command fair prices where they can be gotten. Shipments have been light, averaging but ten cars daily for the last two weeks and the supply in California is nearly exhausted.

The lemon market is in fair condition, especially on 300 size. There is a difference of nearly $1.00 per box between 300s and 360s in New York market on foreigns, the last end of the crop running heavily to smaller sizes. Western markets are taking a few lemons at quite satisfactory prices where the stock is good quality and sound. It is very difficult to place low grade fruit. Indications are quite favorable for continuance of fair prices.

AUCTION SALES.

NEW ORLEANS, SEPTEMBER 7.
S. S. Fr. Ex., Extra Choice Valencias, $3.10.

A largely attended meeting of wine growers was held at Stockton Saturday, to discuss the prices offered by the California Wine Growers' Association. The sense of the meeting was embodied in the following resolution, which was unanimously adopted: "Resolved, That it is the sense of this meeting that the prices offered for grapes by the California Wine Growers' Association and the terms with regard to the deferred payments are both unsatisfactory and unfair." A committee was appointed to discuss prices with the association, and money was subscribed to pay for the services of a man to develop independent markets.

The prices offered by the Association vary from $15 to $17.50 for dry grapes and $10 to $12 per ton for sweet wine, $8 per ton for Muscats. The prices which prevailed last year were $20 to $30 for dry wine, and $12 to $16 for sweet wine grapes. It is claimed by some grape growers of the North that this is an effort on the part of the Wine Growers' Association to discourage further planting of the grape. Southern California buyers at a meeting last Thursday in Los Angeles, decided to pay $15 per ton for Zinfandels, $14 for foothills and $10 to $11 for the white and black varieties of the lowlands. Last year the rate varied from $16 to $18.

CALIFORNIA POLYTECHNIC.

From Leroy Anderson, director of the California Polytechnic School we have received the following:

"Owing to some delays in completing the buildings it will not be able to open for students upon the date first advertised, namely, September 15th. The date of opening has been postponed to Wednesday, September 30th. All of the contractors are finishing their work as rapidly as possible and we feel quite confident that we can receive students on this date. We do not expect the recitation building to be completed but with one or two rooms in it ready for use and the dormitory completed, we can begin the work in a fairly satisfactory manner.

Applications for admission continue to be received and catalogues are being mailed to inquirers. These are sent free of charge to any one asking for the same."

Address Leroy Anderson, San Luis Obispo.

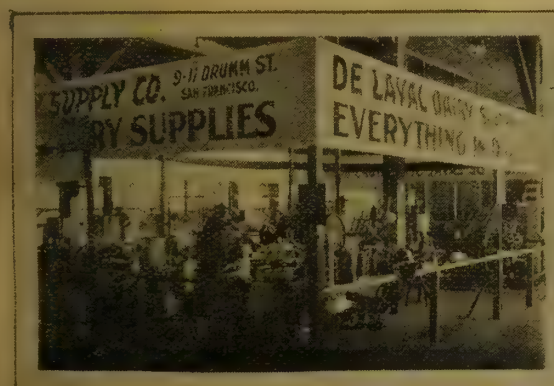
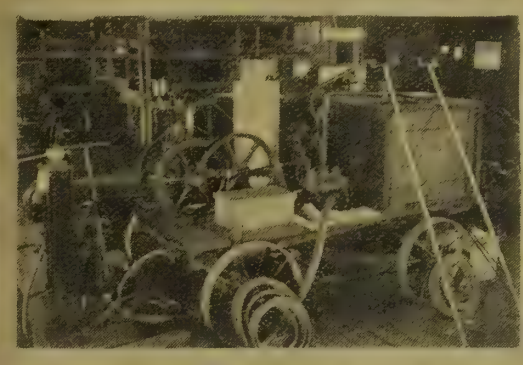
SOME PREMIUM WINNERS IN THE PAVILION.



De Laval Dairy Supply Co.
Exhibit of Creamery Supplies.

Samson Iron Works.
Exhibit of Engines and Centrifugal Pumps.



Bean Spray Pump Exhibit.

STATE FAIR.

One unfortunate feature of the state fair is the locating of the pavilion in the city of Sacramento and the stock exhibits all at the grounds three miles away. It divides the attention and we believe detracts from the interest in the fair. The evenings at the pavilion are made quite society functions with various vaudeville performances to attract the crowd. The exhibits of products and manufactures were instructive as to state resources. Many of the booths were erected by local merchants, and arrayed in beautiful designs which were more of an advertising nature. The cuts above show a few of typical machinery exhibits.

At the grounds were many fine animals though all classes were not fully represented. But the attendance and the possibilities of good to the stock breeder were not as great as they should have been.

The beef breeds of cattle were probably the best represented of any kind of stock. Gov. Sparks of Nevada had a magnificient exhibit of Herefords Probably the finest exhibit ever made in the state. Joe Marzen of Lovelock, Nevada also had a large exhibit of his prize winning Short Horns. It consisted of three cars of beautiful stock. In dairy breeds the Holsteins were represented by Mrs. Gubbay and J. A. Rea of San Jose. In Jerseys Alex Chisholm of San Jacinto, James Horsburg of San Francisco. Thomas Waite of Perkins made exhibitions of fine stock.

In swine the classes were fuller especially in Berks and Poland-Chinas as may be seen in the premium list which appears on another page there were more exhibits in those classes. Clark & Bishop, Poland-China breeders of Kingsburg had a fine herd as may be seen from the winnings. Their ranch is in some of the richest lands of Tulare county and of their 320 acres they have about 150 in alfalfa. Their winnings at the fair show. 2nd. on Boar 2 years and over. 1 and 2 on boars 1 year and under two. 1 and 3rd on boars six months and under 1 year, 2nd on boar under 6 months, 1st, sow 2 years and over, 1st and 2nd sow 1 year and under two, 2nd and 3rd, sow 6 months and under 1 year, 2nd on sow under 6 months, 1st on boar and his get under one year. Silver medal on Boars any age. Gold medal on sows any age.

First Prize O. I. C. 2-Year Sow, Bettey,6919, property Alex. Gordon, Hueneme.

The herd of Poland Chinas owned and exhibited by W. R. McCaslin of Consumnes, Sacramento county, is worthy special mention. Mr. McCaslin carried away many premiums as may be seen by the list on another page.

In the Berks C. W. Reed of San Francisco, Thomas Waite of Perkins C. C. Perkins of Sacramento and W. C. Murphy of Perkins made fine exhibits. The Thomas Waite & Son exhibit had in it a fine boar Baron Victor, bred by A. Lovejoy & Son of Rosco Ill. a typical Berkshire with arched back and good length and typical head.

Messrs. Waite also had some prize winners in the Southdown Sheep. Gold medal champions for buck, champion flock, ewe and lamb, buck and lamb.

In Essex hogs Geo. Bement of Seminary Park, Cal. made a large exhibit.

In Ohio Improved Chester Alex Gordon of Hueneme won over a dozen prizes and a gold medal. Mr. Gordon has great faith in the O. I. C's and says they are admirably adapted to California conditions.

C. P. Bailey of San Jose made an exhibit of Persian sheep which attracted much attention also some beautiful Angora goats.

In draft horses the Oakwood Stock farm of Lathrop exhibited some magnificient Percheron. One, a French Percheron was imported direct from France.

H. S. Pankey, of Santa Ana, Clyde Chipman of Covina, R. W. Hanson of Rio Vista also exhibited Percherons.

PRIZE-WINNING STOCK AT THE STATE FAIR GROUNDS.

Second Premium 2-year-old Shorthorn, property of Isaac Bird of the Chowchilla Stock Farm at Merced.

First Premium 3-year-old Holstein, Gaiety of La Siesta, property of Mrs. M. E. Gubbay, San Jose

First Premium Jersey, 3 years and over, Dot's Violet W., property of Alex. Chisholm, Jacinto

First Premium 2-year-old Hereford, Lady Hesiod, property of John Sparks, Reno, Nev.

The commission for which Secretary Root went to England as one of the two American representatives and which is now in session, will, in all probability, reach no satisfactory settlement. It is composed of the two Americans, an Englishman and a Canadian. As there is no fifth member the probabilities are that no decision will be reached.

The outcome of the corn crop is awaited with much anxiety by the business men of the country. If there is a reasonably good crop with a fair price, as is likely the case we shall see a continuation of good times. But let frost catch the corn unmatured making two successive bad years, and we shall see the pendulum of prosperity begin to swing back.

WALNUT GROWERS' ASSOCIATION

The Southern California Association of walnut growers held an important session in this city this week, the purpose being to fix prices for the crop in hand and to discuss the parasite, which is blighting the trees and destroying them. It was stated that the blight on walnut orchards will reduce the yield this year over fifty per cent and in some sections almost a total loss of the crop will result. A resolution was passed offering $10,000 to any one who will find a remedy for the blight.

Prices were fixed for the product of 1903 as follows: Twelve cents per pound for "hard shells," and twelve and a half cents per pound for "soft shells." Ten and ten and a half cents respectively for second class nuts.

Responding to a request from Secretary Wiggins of the Chamber of Commerce, a ton of awlnuts was voted for exhibition purposes at the St. Louis Exposition, to be contributed proportionately by the several associations.

Secretary Wiggins was also authorized to arrange for an exhibition at St. Louis of the different processes through which the nut passes, in grading and cleansing from the trees to the retailer.

TECHNICAL TRAINING IN AGRICULTURE.

Numbers of our state universities are creating agricultural departments for the preparation of young men in technical agricultural training.

The purpose of this movement is twofold. First to fill a want in our educational system and to enable the farmers to make larger crops with greater certainty. Successful farming is simply applied science in which there is ample scope for the exercise of all the intellectual faculties, and for the application of all learning on hand or available.

The man who brings to his work the qualifications received by education soon learns to respect his calling. The farmer who can unite his faculties with the elements in nature is sure of success and soon becomes so infatuated with his work as to be proud of his co-partnership with nature.

President Roosevelt happily expresses the thought when he says: "the laboring man who feels a just pride in his avocation is entitled to the respect of the world because he holds labor honorable."

No man was ever successful in any business who held that business in contempt. No man can be more certainly successful than a farmer who feels pride in his profession. Laudable pride is a diffusive stimulant and should be taken regularly in full doses.

THE IRRIGATION CONGRESS.

A convention of more than usual interest is in session at Ogden Utah, as we go to press. It will be composed of men of national reputation whose information along lines to be discussed by this National Congress is a guarantee of the worth of their utterances.

The delegation from this state includes the following well known gentlemen:-J. B. Lippincott, F. L. Alles, J. Ross Clark, L. M. Holt, S. W. Ferguson, C. M. Heintz, Ferd K. Rule, C. B. Booth, and J. W. F. Dis of Los Angeles, W. E. Smythe, of San Diego, J. Fairweather of Reedly, W. S. Melick of Pasadena, C. M. Wooster and E. A. Hayes of San Jose, Scipio Craig of Redlands, G. H. Maxwell of San Francisco, C. C. Jones of Keswick.

The dispatches state that it is expected that fifteen-hundred representatives of boards of trade, commercial clubs, chambers of commerce and business organizations of all kinds and of state and municipal governments of the great West will be present and will take part in the four day's discusion of iriation. The speakers on the various subjects will include besides Secretary of Agriculture Wilson. United States Senators Clark and Gibson of Montana, Dubois, of Idaho, Warren of Wyoming, and Burton of Kansas. Senators Kearnes and Smoot are expected to speak informally. Every phase of the subject of irrigation will be discussed, and the closely allied subject of colonization of the great plains and ranges of the west will receive much attention.

Practical illustrations of what irrigation is doing for the West will not be lacking. From all quarters have gone to the congress large exhibits of grain and fruits grown on soil that a few years ago was considered useless, to compete for the prizes and valuable cups offered. The horticultural exhibits bid fair to be the most unique as well as most elaborate ever shown. From across the great American desert, drawn in six "prairie schooners" is going an exhibit of fruit and grain grown in the midst of alkali wastes. Practical methods of irriation will be given, and a good part of each day will be devoted by the delegates to this feature.

Another important subject that will come up is the question of affiliation with the transmississippi congress, and it is expected that before the congress adjourns that some definite action will be taken.

Sugar, "all grades and all lists," advanced 10 cents a hundred pounds without any apparent cause other than that the Western Sugar Refining Company say so.

The good citizen is the man who, whatever his wealth or his poverty, strives manfully to do his duty to himself, to his family, to his neighbor, to the state.—President Roosevelt.

TELL THE GLORY OF THE STATE.

The people of California should never tire of talking the splendid points of their magnificent state. Until one has resided here for a year, or more, and then "gone back East" to spend a few months does he realize the wondrous advantages California possesses in the way of climate, fruits, flowers and other necessary products.

A writer in the current number of Out West contrasts the climate of Rome, Italy, with the climate of Los Angeles, California, showing the advantage this city and state possesses in the matter of climate. It is to be presumed the writer speaks from experience, and the comparison is one certainly to make every lover of California glad that he lives in such a beautiful sun-kissed state. Just home from an Eastern trip, of some considerable extent, the writer can say of a truth there is no place in this country that will compare with Los Angeles and its suburbs for comfort of living and beauty of surroundings. We have one suggestion to make to our campaign speakers when next they mount the platform in foresenic debate, and it is, to talk less politics and more about the glory and the possibility of the state. Let the campaign speakers go up and down the land and proclaim the marvelous progress, the magnificent development of the grand state of California. No devastating floods to wipe out the earnings of a lifetime; no cyclones to destroy the home and maim or kill the occupants; no blizzards to freezze the blood as the laborer goes about his daily work in winter. There is, of course, no campaign on this fall, but next year will soon roll round where the din and harangue of orators will sound upon the listening ears of the multitude. Why not make that a campaign of education, tell of great things done, of good accomplished, of splendid results achieved, and of brighter things for the future.

Now if there was a great state scandal brewing somewhere, how easily it would worm its way into politics to the disgust of all decent people. If somebody had stolen a half million, or a state official had accepted a bribe, or there was waste and extravagance somewhere or incompetence that made for disaster—then a campaign on so-called state issues would come naturally enough.

But there has been honesty and integrity and good judgment in high places; economy has been practiced without parsimony; the state's institutions have grown, new avenues have been found for state usefulness, and all without danger.

The state of California is a veritable young giant. Its broad foundations were not laid too deep. It will become the "Empire of this Country." This is our thought in the absence of anything more interesting to discuss, talk up the advantages of California by so doing the people of the state will be educated and the people out of the state will be attracted to our country by the novel method of campaigning adopted to stir up state pride and to scatter broadcast information so valuable to every one. It would be novel and interesting. Perhaps the people would like the change. It would certainly make no difference to the men who would get office just the same as they would after a blood-sweating campaign of the regulation style.

Anthrax, dreaded by cattle owners, has broken out on a stock farm near Chicago.

The house cleaning now in process in the postal service will have one result which the country will most rejoice to witness, viz: the punishment of rascals in high places and the beneficial effect which will result in causing would be thieves and plunderers of the public purse to stop and consider what their end will be. The severer the punishment the more salutary the lesson.

If the Turkish troubles create a general Eastern war, as may be the case if Bulgaria inaugurates a campaign against Turkey, the demand for American products in foreign markets will be vastly augmented. While war is to be deplored, we can not overlook the fact that our prosperity has been heightened by the recent English troubles in South Africa.

FROM A BUSINESS STANDPOINT

BY J. W. JEFFREY, LOS ANGELES

THE CALIFORNIA FRUIT EXCHANGE.

While all are standing loyally and successfully by the California Fruit Agency tney should not forget that other co-operative institution, the California Fruit Exchange. This institution has been under the management of A. R. Sprague, since its inception than whom there is not a more eloquent and persistent advocate of co-operative methods in the state. At every meeting of deciduous fruit growers attended by Mr. Sprague in the past, he has done effective service for the citrus fruit growers as well, and the Cultivator willlingly gives publicity to the latest statement regarding the business of the deciduous fruit exchange for the benefit of the increasing number of subscribers in all portions of the state. The Board of Directors have just sent out the following prospectus:

From various sources in this state and others, and from foreign countries, are coming inquiries concerning the California Fruit Exchange, wishing to know what its methods are, what it has accomplished, and what it aims to accomplish. For convenience it seems best to issue a brief statement in answer to these queries.

The California Fruit Exchange is a strictly co-operative organization of fruit growers, to save themselves the profits usually absorbed by commercial paskers and shippers of fruit, and to secure prompt and efficient sales of their products, and quick and honest returns.

It is composed of large individual growers and shippers, and of members who represent local associations of growers.

These local associations are formed to secure the proper preparation of the fruit for market in car lots, and these cars are then turned over to the central association—The California Fruit Exchange—to be marketed.

This has been found most satisfactory wherever tried. Each local association is entitled to one representative membership in the body constituting the California Fruit Exchange.

The customary brokerage is charged for sales of fruit, and all profits resulting from the economies of the business and discounts from purchase of supplies in large lots, are divided as dividends in the proportion which each member's shipments bear to the whole volume shipped.

All local questions are settled by the local associations, and all matters affecting the general business are determined by the Central Exchange.

Its Eastern agents are carefully supervised and prompt information and reports of market conditions are always available.

No one method of sale is insisted upon except that the money must be received when the fruit is turned over to the buyer, and until that time it remains in the hands of the Exchange or their agents.

As the fruit is good security for reasonable amounts, advances can readily be had with the customary conditions.

This system, which has worked well for so many years in both citrus and fresh fruits, is the only protection which California growers can have from the irregular and dishonest practices which so often disgrace the fruit business in the east. By this system the Fruit Exchange in two years has grown to be the third largest shipper of California fresh fruits. Success is the best recommendation.

It makes no war upon the commercial packers and shippers; on the contrary it strives to be at peace with them, and in all things in which their interests are common it seeks to work harmoniously, but it stands, first, last, and all the time for the protection of the grower, both in matters of information and economical and advancement of the general orchard interests of California. When the time comes that under this or similar system, all the fruit interests of the coast, both of growers and commercial shippers as

well, shall be united to promote the interests of California fruit in the markets of the east, the distribution through their own agencies will be complete, their advertisement of California fruit will vastly stimulate consumption and the economy of marketing it will save hundreds of thousands of dollars to the fruit growers of the state.

If the corn crop is harvested without loss the tourist crop in California will be simply immense.

The Inyo County Bee-keepers Association has sold its output at $201.00 per ton, delivery to be made not later than September 30th. The Gregory Fruit Company of Redlands is the purchaser.

A Kansas clergyman has refused an ofier of $3000 a year at baseball to refain his present situation at $500. An Iowa Supreme judge receives $4500 per year and has been offered quite as large a salary as a baseball pitcher.

Unless the Southern Pacific and Santa Fe passenger department in Los Angeles and San Francisco have been misled the coming winter months will bring to Southern California the largest influx of tourists in the history of Western travel.

The largest tree in the Tulare, Cal., forests has been felled and will be exhibited at the World's Fair, St. Louis. The tree is 28 feet in diameter. It was necessary to construct special machinery to cut the tree so that it could be placed on cars for transportation.

The Corona Courier is responsible for the statement that large herds of cattle are being shipped into San Jacinto, where Francisco Pico, owner of one of the biggest ranches in that district, has decided to go into the cattle business and let dry farming go for awhile.

Throughout nearly the entire United States the annual state, district, and country fairs are in progress at this time and will be for the next three or four weeks on the racinc coast. The exhibits are exceptionally fine and large, especially in stock and farm produce, and the attenuance in each is far above that of any other year.

Governor Pardee is taking great interest in the subject of irrigation. He expressed the hope that before the end of his official term he will see the proposed giant irrigation system in full blast in the Sacramento valley. This system contemplates commencing in a large reservoir in the Clear Lake region and a canal five miles long on the west side of the Sacramento valley.

The growth of the salmon packing industry on the Pacific coast, from its inception in 1866 to the close of the season of 1902, is shown in a tabulated statement recently issued by the Alaska Packers' Association. The total pack in the thirty-seven years reaches the enormous figure of 48,221,381 cases. Operations first began on the Columbia river, the aggregate pack to the close of 1902 reaching 14,247,494 cases. Although the Alaskan fisheries were not exploited until twelve years later, the pack from the northern waters exceeds that of any other district, yielding from 1878 to 1902 a total of 15,649,876 cases. The newest field is on Puget Sound, where extensive operations were not begun until 1891. In twelve years the Puget sound pack totals 4,596,472.

The long list of special expositions held in New York city is to have an addition in January, 1904, in a National Fruit and Wine Exposition. It will be held January 18th to 30th at the new Herald Square Exhibition Hall at Broadway, Sixth avenue and Thirty-fourth street. Its projectors say that among the responses received to their invitation to individual fruit growers, packers and shippers, and associations of them, and to wine manufacturers, to exhibit, are many evidences that the exposition will be seized as an opportunity by the boards, of trade, promotion committees, county commissioners, fruit associations and other commercial bodies to advertise in and through this metropolitan show display all of their home resources and attractions, as well as horticulture, its products and auxiliaries.

Coast News and Notes

By R. A. Dague, 1130 Eddy St., San Francisco

Late reports from Oregon say that the recent hot weather has injured the prune crop of that state.

The San Jacinto cannery is turning out 5,000 cans of peaches per day, and is refusing peaches because it cannot get sufficient help.

Attorney General Donovan, of Montana has decided that all dairy cows afflicted with tuberculosis in that state must be slaughtered.

The total shipments of fruit this year as reported by the California Fruit distributors up to this date have been 4,865 cars as against 4,750 the same date last year.

California produces one fourth the beans raised in the United States. We produce more wine, raisins, plums prunes oranges and honey than all the rest of the union.

The National Bankers Association will meet in San Francisco Oct. 20, and remain in session three days The Association has a membership of 20,000, representing 7,000 banks.

The late arrest at Oceanside of ten Chinamen and two Mexicans has brought out the fact that there is an organized system in force for smuggling Chinese into the United States

Heldsburg last year licensed the slot machines and derived a revenue of $1,400 per year. Public sentiment condemned the machine, the licenses were revoked and the machine must go.

The market for California deciduous fruits in the East is growing steadily larger. The average shipments are one hundred car-loads per day and the total for the season will not be less than 8,000 carloads.

The Woodland Cannery has transacted a good business this summer, up to this date the run has been about 9,000 cans of apricotts and 10,000 cans of peaches. The cannery will begin this week on tomatoes.

One day last week the "Silesia" left San Francisco for Europe loaded with 600 tons of "carry-over prunes" A few days beore the "Texas" sailed loaded with 11,374 packages. The carry over prunes are leaving the coast rapidly.

Coinage at the San Francisco mint for August was $2,548,000. Of this amount $2,004,000 were coined into Phillipine pesos. On Sept. 2nd. the mint at Philadelphia turned over to the steamships for Manila, Phillipine coins to the amount of $928,650.

A California professor says an acre of eucalyptus trees will produce each year the equivalent of thirty tons of coal. He advises the planting of eucalyptus in this state and says if that is done no worry need be indulged in over the exhaustion of the coal fields.

From now on until the middle of next month there wil be no salmon in the market. The closed season began last week and will continue until October 16th. Any person catching or disposing of the fish during this time will be subject to a fine of $200.00

The effort to stamp out a Foul Brood in the Fresno apiaries, mentioned in these columns some time ago was not successful. F. G. Story, the inspector, reports that out of 1,555 stands inspected he found the disease in six stands. The disease is highly contagious.

H. E. Huntington's plans involve the expenditure of millions for taking water from the San Joaquin river to furnish power for his immense electric projects in Central and Southern California. There are to be canals and tunnels and immense reservoirs and three power plants. It is a collassal undertaking.

The Chamber of Commerce of Boston has made public the result of its investigation as to the apple crop for this year. The report says apples and in fact all fruit is short in Great Britain. All Europe is short on fruit except oranges and Almeria grapes. The apple crop of the United States and Canada will be large.

A flock of ostriches at Phoenix. Ariz., now numbers more than 1,000 birds.

Clearings of the San Francisco banks for August were $123,825,904, against $107,825,113 for the same month last year.

W. O. Emerson, of Haywards, has raised this year a fine crop of quinces Several specimens of the fruit weigh more than a pound.

The California Wine Association which has a capital stock of $10,000,000 will establish a winery at Hercules in Contra Costa county. The directors are: I. W. Hellman, H. E. Huntington, Antone Borel, Albert Leachman, H. Van Bergen, J. Frowenfeld, Percy G. Morgan, P. C. Rossi, C. Schilling, J. J. Jacoby, and I. W. Hellman Jr.

Grape prospects are good everywhere in the state except in Santa Clara county. Here the leaves fell off and the fruit shriveled up in some parts of the country. The general crop, however, in the state wil be large. Last year 350,000 tons of grapes were crushed from which twenty-five million gallons of dry wine and 15,000,000 gallons of sweet wine were obtained.

J. A. Filcher and Frank Wiggins Commissioners are determined that California shall lead all the states at the St. Louis exposition. Among other striking things they will provide will be a mammoth cheese. The milk of 400 cows for two days will be required to make the cheese which will weigh a ton. They will also have on exhibition a sea bass that will weigh 450 pounds. The large fish has been mounted.

A. C. Bloom, of Sacramento county believes that a certain parsnip causes the death of cattle. The matter was referred to Prof. H. M. Hall, botanist of the State University. The Professor say s the parsnip is technically known as Ciuta Bolanderi and is one of the water hemlocks. The plant is poisonous to stock. The symptoms are:- Muscles begin to twitch, eyes water, animal excitable, increased rate of breathing and spasms. The treatment includes the giving of doses of milk and lard.

Owing to good results from past efforts the California promotion committee is preparing to re-double its efforts to induce immigration to this state, especially to the Sacramento Valley. They wil work with the Sacramento Valley Development Association for a time. During July advertising literature was sent to 2,500,000 persons. B. E. Hutchinson of Fresno who went east as a representative of the Association, has already sent more than 200 people to the state who will be permanent settlers.

The first course of forestry instruction under the auspices of the California State University was given this summer. There were but twenty students, but it was a beginning. It is high time a movement was made to preserve the forests and start new ones. The forests of Michigan, Wisconsin and Minnesota, originally contained 350,000,000 feet of lumber, Three fourths of it has been cut. The remainder is not marketable. More than half the yellow pine of the South is gone and the forests of the Pacific Coast are fast going.

Santa Barbara will soon have an industry the first of its character in the world. The Carpenteria wharf, says the Santa Barbara Press, together with fourteen acres of land were sold by Frank Smith to Albert Carter of Los Angeles. On a portion of this land there will be installed in the near future the first solar furnace plant for the manufacturing of salt from sea water The process is a new one and has been thoroughly tested on a small scale. The plant to be put in at Carpenteria will be a large one, and the output will be limited only by the quantity of sea water that can be pumped into the great reservoir.

The Isleton Creamery, on the Sacramento river, is reported to be making from 1,400 to 2,000 pounds of butter daily.

The ship, Star of Russia, recently brought to San Francisco, from Alaska, 28,000 cases of salmon. She has returned for a second cargo.

The hop harvest is ended. Owing to the failure of hops in England and the poor crop in Oregon, California growers are hoping for higher prices.

Dr. Charles H. Blemer, State Veterinarian, has finished his inspection of cattle in Inyo county. He says the disease that has carried off so many cattle is undoubtedly anthrax in an aggravated form. The trouble will not cease until cold weather comes.

For the first time the United States government recently refused to admit adulterated wine into San Francisco, under the pure food law. A lot of white wine from Bordeaux, France, was analyzed, and was found adulterated with acid and was refused entry.

The largest run of salmon known in many years is now on in the Sacramento river and in the San Pablo and Suisun bays. The Fish Commissions claim the credit is due to the artificial propagation which they have carried on for several years in these waters.

The dried fruit market in San Francisco had last week quite a little boom. Evaporated apples brought 4½ to 5 cents; peaches 5½ to 6; quartered pears 6; and prunes 3½ to 4. As usual buyers think the price will tumble, while producers look for an advance.

Later reports than those heretofore given in these columns of the yield of wheat in the nortnwest this year are as follows: Washington, 19,100,000 bushels; Oregon, 11,400,000 bushels; Idaho, 4,250,000 bushels. This is about twenty-five per cent. below that of last year.

The newly incorporated Jackson-Granger dairy, whose main office is at Alvarado, has leased 340 acres of land and will stock it immediately. A citizen of Sunol has leased 428 acres adjoining the Jackson-Granger farm, and will also go into dairying extensively.

The California raisin crop for this year is estimated at 4,500 carloads. The prices set by the California Raisin Grower's Association for seeded raisins is 7 1-2 cents for fancy and 7 1-4 for choice. Last year the prices were 6 7-8 cents for fancy and 6 5-8 for choice.—Orange News.

C. H. Bentley, manager of the sales department of the California Canners' Association, says there will be a shortage of canned apricots, and that the price will advance. He adds that this season has developed an increased demand for canned fruits of all kinds. The demand from England is larger than ever before.

San Joaquin county the largest shippers of potatoes in the state will this year, from figures obtained, yield a greatly decreased acreage from last year. In 1902 there were 28,000 acres planted as against 15,000 this year. Potatoes are now selling at from 85 to 90 cents a sack, as against 35 to 40 cents last season, says a San Joaquin exchange.

A course of instruction in farming will be given in the agricultural department of the State University, beginning October 6th, and closing December 17th. The course will embrace every conceivable detail of the farmers' work, from animal industry to insect preventives and dairy bacteriology. Circulars will be sent to all who apply, explaining the course of study.

A correspondent from Los Gatos writes of the general prosperity attending that locality. The canneries are busy on pears and lemon cling peaches. Grape packing will commence in about another week. The cannery contemplates making a run on tomatoes commencing about the 25th. of September, and operating possibly through the month of October, depending upon the supply of the fruit. Canning to date is reported to be seventy thousand cases, and about sold out. Daily shipments are going forward to various points, both domestic and foreign.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS

(Continued.)

We have already learned the striking peculiarities of the great locust order—Orthoptera. We remember that they, like the lace wings have biting mouth parts and like one sub-order of the lace wings pass through incomplete transformations. The striking difference between Orthoptera and Neuroptera lies in the front or primary wings. We remember that these are straight and thick in the Orthoptera, reminding us of the thick wing covers in beetles. These thick, parchment-like wings are known as tegminae and are very different from the hind wings while in the lace wing flies the hind wings are very much alike.

* * * *

Earwigs—These are very rare insects not only in California, but in the whole country. In a general way they remind us of the rove beetles, as their upper wings are very short. Of course they are not beetles at all as they go through incomplete transformations. They are very easily identified, as they have appendages at the tip of their body which resemble forceps. Their rear wings have many radiating veins, very different from the other insects of this order. These fold in both directions, thus reminding us again of beetles. The complex nature of this hind wing leads some entomologists to classify them as a separate order. So far as I know these insects do very little harm, though it is sometimes stated that in Europe they are injurious to fruits and other vegetables.

* * * *

Cockroaches—Few people are there but what are familiar with the common cockroaches. They are flat and very thin so that they can hide in very slight crevices. They are frequent in houses and are often met in cellars and in storehouses, especially where sugar and other like articles are kept in store. They are very general feeders and few articles either of pantry, cellar, or of out door nature go amiss in their dietary. Many of these are wingless, though doubtless all once possessed these organs. The cockroach lays its eggs all at one time. These are encased in a membrane and are much the form of a bean. Cockroaches are not difficult to destroy, as they take greedily to sweets mixed with poison and are also repelled by the use of insect powders.

* * * *

Praying Mantis—In California and the Southern United States, there exists an insect which is so peculiar that it must always attract attention and excite interest. Its prothorax and front legs are greatly developed. These front legs are fitted to act like jaws and the insect uses them to grasp its prey. The reason that they are called Praying Mantis is from the fact that they appear to be on their knees or that as they raise the forward part of their bodies, they remind one of the attitude of devotion. Devil's-horses, or rear-horses are other names given to them. Their abdomens are large and flat and are covered by their wings when they are not flying. They look formidable but are entirely harmless as far as man is concerned. Unlike all other insects of this order they are our friends and not our enemies. They live wholly on other insects and must do a great deal of good in destroying our insect foes. These too deposit their eggs in great masses something as do the cockroaches. I have often nad these egg-masses in boxes in confinement and as soon as the first eggs hatched the young insect would stand in wait and would eat up all his brothers and sisters as soon as they came from the eggs. I know of few insects that manifest greater ferocity than do these giraffe-like insects. I have said that they are our friends, but like the dragon flies they are not always discreet in their food taking and so many a honey bee becomes the victim of their hungry voracity. As I stated in speaking of darning needles I have little doubt but that their benefits are far in excess of any evil they may do.

* * * *

Walking Sticks—Every person who has sought the seclusion of bush or forest has met, not infrequently, these curious spectre-like walking sticks. How well they are named. They mimic almost perfectly a straight stick, appended to which are six stick-like legs and two stick-like antennae. They feed wholly upon vegetation and were they more numerous might do considerable harm to farmer and gardener. Even though they have long legs they are slow and awkward in their movements. Thus they cannot escape danger by flight; neither are they provided with any defensive organs. They are, however, well protected in their astonishing mimicry. When young they rest usually upon the leaves and are green in color and so when not in motion are effectually hidden. As they grow older they become gray or brown and thus again are not distinguished by bird or insect from the twig on which they rest. They never possessed wings and so are not rapid of migration. Their eggs are very large and I have known them to be thick enough in trees so that the dropping of the eggs would suggest a slight shower.

In our next article I will consider the three remaining families, the locusts, grasshoppers and katydids, and the crickets, which are by far the most destructive families of this order of insects.

* * * *

THE NITROGEN-FORMING LEGUMES.

Gen. Paul Jennison of Covina wishes to know where the nitrogen is stored in peas and other leguminous plants. He asks if it is in the roots, tubercles, or in the part above ground or in the entire plant. Gen. Jennison has thought of using the vines for hay and depending on the roots for nitrogen.

We must remember that the nitrogen of the air cannot be taken and used by most plants. They can take the nitrogen only in combined form. The bacteria—the little microscopic plants, that fix themselves on the roots of legumes can take this nitrogen and combine it, which they do, and this is stored in the liquids of their bodies. In this combined state, it is constantly passing to the sap of the legume which harbors the bacteria. It now passes to all parts of the plant which it nourishes and which grows with surprising vigor because of this needed nourishment. Of course not a little passes to the peas themselves, though much remains in the roots and a large portion in the vines. To get the most fertility, all should be plowed into the soil. If however, it is desired to feed the vines and peas to stock we can receive a double benefit, feed our stock and also secure a very rich stable fertilizer for our land. Rich food makes very rich manure. Peas and pea vines help form a very rich food regimen. It may pay to pick the peas and sell them as they may be worth more to sell than to use as a fertilizer. Of course if they are sold off the farm they are lost to it, but even then we must remember that we have stored up a large amount of nitrogen from the air in the remaining roots and vines. It only remains to be said that the tubercles which house the bacteria are doubtless excrescences caused by the irritation of this bacillus.

* * * *

FENNIGREEK.

This new legune is attracting a great deal of attention at the present time. It is said to make an astonishing growth and is recommended as the very best legume to use in enriching the soil. It must be remembered that most legumes are supposed to have their own specific bacillus, which can thrive only upon these especial legumes and so are of no usé to others. For this reason I have often urged that our orchardists and other ranchers decide once for all what legume they will use to enrich their soil that they may always be sure to have the specific bacteria which works in connection with this special legume. Peas grown where peas have never been grown before are likely to make only a feeble growth as they are without the bacteria neces:ary to the formation of nitrates or combined nitrogen. In this case it is necessary to get soil where peas have been previously grown and sow the very slightest amount of this where the peas are to be planted. It is supposed that in case of the new plant, fennigreek, the burr clover bacillus, which is in all our soils, finds ready harbor and a congenial food plant, and thus this new plant is already for the best work. It is to be hoped that it will continue to give the satisfaction promised.

* * * *

A GRAPE FRUIT SCALE.

A subscriber, A. L. Wing, Glendale, sends a piece of pomelo peel which is thickly covered with a small light colored round scale. He wishes to know the name of the insects and the remedy. This is Pergandi's scale. Parlatoria pergandii. It belongs to the same family as does the red and purple scale, and though not very common in California, would if numerous enough, be a serious pest. I think it has now been proved beyond question that the distillate spray is a specific against all these pests. In case of grape fruit and lemons, we can use a stronger mixture, even 2½ or 3 per cent. of distillate. The less dense foliage makes it possible to reach practically all the leaves without getting so much of the distillate. As I have stated previously 2 or 2½ per cent. had better be used in case of the orange. We must remember that this distillate spray kills by contact and unless we are thorough we will not reach all the scale and hence the results will be unsatisfactory.

* * * *

APHIDS ON CUCUMBERS.

J. Key, Buena Park, sends cucumbers which are seriously affected with plant lice. I do not find any of the work of the Brachonid flies, and so it may be necessary to fight these by artificial means, although there are so many enemies of these aphids that the chances are that they will soon disappear. The sovereign remedy for these insects is kerosene emulsion. In case we could form a thorough mechanical mixture in a small way it would always be wiser to use distillate spray in lieu of kerosene emulsion.

* * * *

FULLER'S ROSE BEETLE.

T. L. Vance, Santa Paula, sends Fuller's rose beetle. He finds them eating beans as well as lemon leaves. I find these are abundant in Santa Barbara and Ventura counties. The grubs there as well as in Los Angeles county are destroying strawberries and raspberries. Mr. Maskew's careful experience prove that bi-sulphide of carbon, one-half ounce to the hole applied every eighteen inches, kills all insects in the soil. This costs 10 cents for 75 running feet. Surely this cost is not prohibitive. The remedy then will be moving the site of the strawberry bed some distance, or the use of bi-sulphide of carbon. These grubs of this beetle are surely a serious menace to our California strawberry growers.

* * * *

SULPHUR FOR THE SILVER MITE.

John N. Glenn, San Diego, refers to the recommendation in the government year-book for 1900, p. 288, to use sulphur for the silver mite. He requests that we give the amount, in case we approve the recommendation. It is wise always, in spraying for mites, to add 20 pounds sulphur to 200 gallons of water. True the distillate spray will kill both mites and eggs. Yet not all will be reached and so not all will be killed. As we know the fumes of the sulphur, caused by the sun's heat, kills the mites, thus it will add to the effectiveness of the distillate spray. The distillate spray rightly used will kill all kinds of scale of susceptible age, and most of the mites—red mites (red spider) and silver mites. The sulphur which will cost but little will complete the work on the scale.

* * * *

ASPARAGUS SCALE.

Mrs. M. I. MacKenzie, Ventura, sends a scale which works on her potted asparagus—A. plumosus. This is the same Lecanium that troubles so much on the sword fern. Drenching severely and thoroughly and repeatedly with strong soap suds is the best remedy. Mrs. MacK. is also troubled with some caterpillar on her hollyhocks. She sent one in a cocoon, but it was dead and dried up, so I can not identify it. Paris green, one ounce to 12 gallons water, well stirred, is the cure for all caterpillar mischief.

* * * *

THE INSTITUTES.

The Fillmore institute was much enjoyed, though the attendance, owing to the lack of advertising, was not as good as usual. A study of the orchards showed that the black scale were hatching very evenly, and were nearly all out. This then is the time to spray or fumigate. Mr. McIntyre spoke of the Scutillista. He is breeding it for distribution and hopes much from its work. Mrs. A. Basley was listened to with great interest at Fernando, Tropico and San Dimas. She is a valuable lecturer on poultry.

The orchards at Fernando show almost no scale. The institutes at Fernando and Tropico were of the very best. Both places urged for another institute if possible next year. The scale are all hatched at Tropico. In the rich dairy region of Bolsa Mrs. Sherman's dairy talks were listened to with great interest.

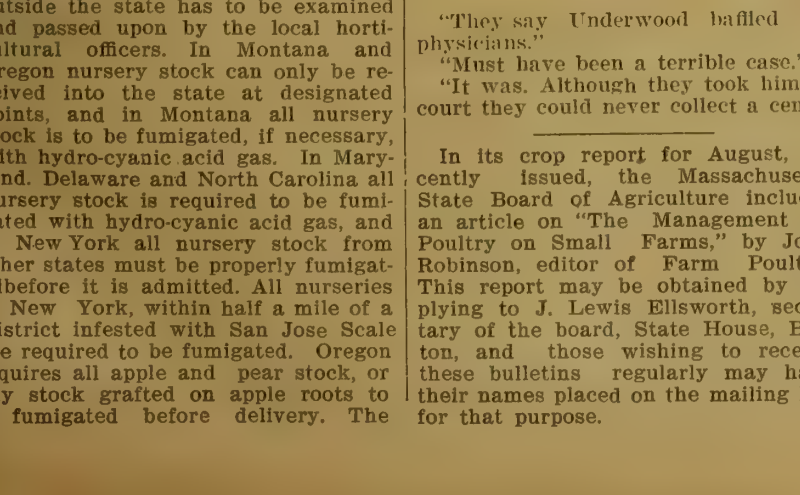
California Horticulturally

JOHN ISAAC, SACRAMENTO

LUTHER BURBANK'S EXHIBIT AT THE STATE FAIR.

One of the most attractive features of the state fair at Sacramento is that made by Luther Burbank of some of his many new productions. Many of these are marked improvements over old varieties, and the large number of different varities exhibited show how extensive, thorough and successfull have been the labors of Mr. Burbank in hybrization. He has not confined himself in his work to any one branch of horticulture, but seems to be equally master of all, and has apparently molded nature to his will to produce whatever he desires.

The term "Wizard of Horticulture" applied to him is a most objectionable one as it belittles his genius. Mr. Burbank is no wizzard. He has accomplished nothing with a magic wand or its hocus pocus formula. A wizard is a humbug; Mr. Burbank is none. But he is a wonderfully scientific man, a close student and indefatigable worker possessed of untiring patience. He has studied nature and mastered her laws, and knows how by applying those laws and waiting patiently for results what he will accomplish. It is this combination of knowledge and patience that makes his genius and not any miraculous or maigcical endowments.



Gold Medal Exhibit of Luther Burbank at State Fair.

* * *

HORTICULTURAL QUARANTINE IN OTHER STATES.

California has been the pioneer in many matters of benefit to the horticultural industries and her movements have been followed by other states and foreign nations.

Horticultural quarantine and orchard inspection orginated in California, and for many years our horticultural laws have been strictly enforced and with such marked benefit to the fruit industry that they have been adopted by a number of the states of the Union and by several foreign countries. The wisdom of, and necessity for laws regulating the importation and distributation of nursery stock has been forced upon many sections by the introduction of the San Jose scale into the orchards of the East, and the enormous damage that has followed such introductions. The horticultural laws of most of the states are largely based upon those of our state, some are almost exactly copies, while some vary considerably. in Oregon, Colorado, Idaho and Montana, all nursery stock imported from outside the state has to be examined and passed upon by the local horticultural officers. In Montana and Oregon nursery stock can only be received into the state at designated points, and in Montana all nursery stock is to be fumigated, if necessary, with hydro-cyanic acid gas. In Maryland. Delaware and North Carolina all nursery stock is required to be fumigated with hydro-cyanic acid gas, and in New York all nursery stock from other states must be properly fumigatedbefore it is admitted. All nurseries in New York, within half a mile of a district infested with San Jose Scale are required to be fumigated. Oregon requires all apple and pear stock, or any stock grafted on apple roots to be fumigated before delivery. The states having no horticulture quarantine laws are: Alaska, Alabama, Arizona, Arkansas, Kansas, Maine, Minnesota, Mississippi, Nebraska, Nevada, New Hampshire, Oklahoma, Rhode Island, South Dakota, Texas Vermont and Wyoming.

Efforts have been made to have a federal horticultural quarantine law passed, and it will probably succeed in time. The necessity for such a law is patent in view of the fact that we are threatened on the south with the Morrellos orange maggot, on the west with the Queensland fruit fly, and on all sides with other pests, and further in view o fthe fact that all our injurious pests are imported species. It is of little use for California to fight against the importation of the orange maggot from Mexico, or other states to endeavor to keep pests from being introduced,while our whole country is open to the enemy and they can be brought into the United States at most of our ports only to find their way at some unguarded point into the territory of the protected states.

ENDING OF THE STATE FAIR.

The state fair ended on Saturday night with the largest attendance that has been present on any occasion Interest in the exhibits increased steadily as the fair progressed and each evening saw a larger attendance than the preceding one. It shows an improved condition of popular taste that the exhibit in the pavilion drew better than the races at the track, and the receipts at the former were more than at the latter. Altogether the affair has been one of the best of the kind ever given in Sacramento and reflects credit on the management who were unsparing in their efforts. One unfortunate event was the practical destruction of the poultry exhibit by a svere north wind, which blew down the awning under which it was being held, destroyed many of the coops, and scattered the poultry. It was not thought worth while to repair the damage and the poultry show was permanently concluded. The awarding of a gold medal to Luther Burbank will be appreciated by the horticulturists of the state as a merit ed recognition of that gentleman's labors in their interests. It is to be hoped that the interest taken in the late fair may be indicative of renewed interest in these exhibitions and that next year it may be even better and that more of the counties of the state may be represented than were shown this year.

"They say Underwood bafiled six physicians."

"Must have been a terrible case."

"It was. Although they took him to court they could never collect a cent."

In its crop report for August, recently issued, the Massachusetts State Board of Agriculture includes an article on "The Management of Poultry on Small Farms," by John Robinson, editor of Farm Poultry. This report may be obtained by applying to J. Lewis Ellsworth, secretary of the board, State House, Boston, and those wishing to receive these bulletins regularly may have their names placed on the mailing list for that purpose.

CITRUS TREES

That will grow, bear profitable crops, and are true to name, are the only kind that we propagate. Thirteen years in the citrus nursery business — hence know the wants of citrus planters. Sumptuously illustrated catalogue on citrus culture *free;* send for a copy.

Be Sure and Get

Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

J. K. Woodward & Co.

171 NinthSt. Riverside, Cal.

THE
Vernon Nursery

We will offer 100,000 deciduous fruit trees for sale next season

If you are thinking of planting it will pay you to give us a call before placing your order

We are headquarters for all kinds of deciduous fruit trees, nuts, grapevines, berry vines and blue gums

A day spent looking over our nursery will be money well invested

A. YARNELL,

Station K. LOS ANGELES, Cal.

By J. W. Mills, Ontario, Cal.

APPLES AND PEARS FOR HOME USE.

Editor Cultivator: Will you please give me a list of the names of half a dozen each of pears and apples, that do well in Los Angeles county? My home is in the foothills inthe Cahuenga valley east of Hollywood.—E. H. F.

The soils that are found in the confines of Los Angeles county are so varied that a general list is not possible, but for a warm location, we judge that the following varieties would do as well as any. Cole's pear is a prolific variety and excellent for canning, though not very good to eat out of hand. It is also an excellent sort to bake. Lawson is a large, yellow pear that ripens about the middle of July, is excellent to eat out of hand or to bake. St. Andre ripens the first of September and is a very delicate variety (the fruit) and is a favorite kind with us. The tree has never been affected with the blight, though other varieties surrounding it were killed by blight. Seckle is also a good pear, being slightly affected by the blight, but still bears good crops. It is our sweetest pear. Winter Bartlett is an excellent winter pear. It is very prolific and of good quality. None of the above varieties except the last named, have very much of the granular flesh near the core that is common with most pears. St. Andre is entirely free from it, giving the flesh a smooth and very agreeable taste.

* * * *

We do not know of a better all-round early apple than Red Astrachan, except that it is a shy bearer some seasons. It has a close rival in Early Harvest, it being a regular and heavy bearer and coming in at the same season. It is not so acid as Red Astrachan, which makes it less desirable for cooking purposes. For a sure crop of early apples, Early Harvest cannot be excelled. Skinner's Seedling ripens just as Red Astrachan goes out. This goes under the name of Skinner's Pippin and Santa Clara King. It is one of our best summer apples. The color is a light yellow, quality good and sells well. The tree is a good grower and almost wholly resists blight. Yellow Belleflower and Missouri Pippin are also good varieties, the latter being our best all round red winter apple for warm situations. White Winter Pearmain is our best late apple. All apples require a great deal of water. On our light sandy soil, the late varieties require as much water as orange trees in full bearing.

FARMERS' PICNIC AT POMONA STATION.

The regular fall picnic of the farmers' clubs was held at the Pomona Experiment Station this week and was largely attended.

Hon. John Wasson called the meeting to order at 10 a. m. The exercises were opened with prayer by Dr. Gates of Pomona college. The audience sang America with much spirit, following which, Mrs. Minnie E. Sherman of Fresno read a very excellent paper on the home. Much discussion followed the paper and Mrs. Sherman answered many questions in an entirely satisfactory manner.

The afternoon session opened with the question box, Prof. Cook in charge. Questions of fertilizers, both green and commercial were discussed. It was the opinion of those most experienced that they should be used in conjunction. Mr. P. J. Dreher, President of the San Antonia Fruit Exhange, said that when he plants field peas, he plants with them, about 2 pounds of double superphosphate. Peas next to the north side of the trees come up within a few days; towards the middle of the rows, they are twice as long in sprouting and on the south side, they are still longer in sprouting. This shows the necessity of soaking the seed before planting.

Summer planting of green manure crops was discussed. Prof. Cook cautioned growers against growing summer crops in orange groves without first making a trial on a small scale. Mr. Jas. Boyd of Riverside said that Canada field peas will not do for a summer crop as they are a winter growing plant.

The respective merits of spraying and fumigation were discussed. Spraying with distilate and water was generally recommended by grewers present, on account of its cheapness.

Mr. P. J. Dreher spoke a few minutes on the consolidation of the exchange and shippers.

Prof. Leroy Anderson of the San Luis Obispo Polytechnic school spoke at some length, explaining the aims and needs of the new institution.

John Dean of Moneta has raised from seed forwarded from the Department of Agriculture a novelty in the form of the Turkestan soup bean. It is planted in April and ready for the table in August. No irrigation is required. We hope to hear more of it later.

Professor Shaw believes that raising beets is just as profitable to the farmer as any other crops. Taking the total of 326,000 acres of beets cultivated since 1888, he finds there has been an average production of 9.8 tons per acre. annually, giving a return of $444. or a net profit of $14 per acre.

The professor says that with a proper system of irrigation California alone, could readily supply the entire present and prospective sugar consumption of the United States and still leave ample room for orchards and vineyards and the production of the home supply of breadstuffs.

California is collecting for the World's Fair, a display of fruit that will surprise even those who are familiar with the wonderful products of the state. A peach grower near Farmersville took to the cannery a few days ago sixty-three peaches that weighed 47½ pounds.

Secretary Shaw recently said in a speech that the prosperity of the United States is unprecedented. The annual production capacity of the people is $11,000,000,000. Of this we export $1,500,000,000. We import grains and goods mainly non-competitive, with our own products, to the value of $1,000,000,000. We therefore consume equivalent to 95 per cent of all we produce.

The report of the Industrial Commission gives some interesting and pertinent information regarding the cost of irrigation. This is shown to have been not more than from $2 to $5 per acre in the original pioneer ditches, but the cost has increased with the necessity for storage and for long canals to about $12 an acre. The average annual cost of conveying the water has been about $1.25 per acre, including all costs of repairs and maintenance. The report advocates national control of all sources of water supply upon which two or more states may depend for irrigation.

JERSEY FAIR.

There is still a possibility of a fall exhibit of Southern California Jerseys and a butter test, but the probabilities are not so strong as they were earlier in the season. Almost insurmountable obstacles seem to loom up before the promoters; principal of which is the inability to secure a location for making the exhibit.

The scrap between local speculators who wish to appropriate the property of the Fair Association and the state authorities has resulted in the fair grounds being tied up so the association cannot find the suitable location. Rather than proceed in the face of this obstacle the association may yet decide to hold over till another year, then hold an exhibit in which two years of energy and enthusiasm may be combined.

The Coming Hog, Not Liable to Cholera.
ALEX. GORDON, Hueneme, Ventura Co., Cal

Address all communications to
Dr. H. D. Fenimore, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given in this department free of charge. When an immediate reply by mail is desired, enclose one dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

FLATULENT COLIC.

Editor Cultivator: What is the quickest relief for a horse attacked with bloat? There have been several cases where horses have died recently from bloat. Answer through the Cultivator. —Subscriber.

If the gas formation in horses is confined to the coecum and intestines, bloat is usually very easily cured by tapping the coecum with trocar and canula and letting off the gas, then giving an anti-ferment to prevent the formation of gas, but if the bloat is confined to the stomach and tapping the coecum does not give relief, then the probang must be passed through the mouth to the stomach.

LEAKING TEATS.

A five-year old Jersey cow, during her last milking period leaked milk badly from all four teats. During the period previous to that the leakage only commenced near time of milking, when the udder was distended, but in this last period the mischief seemed to go on any time of the day, when she was moving around the pasture or even when lying down. She is now dry and will shortly freshen again. Is there any device Dr. Fenimore can recommend to prevent this trouble and loss. The cow is a heavy and very free milker. Please answer through columns of your esteemed paper.

This trouble is due to a relaxed condition of the sphincter muscle at the opening of the teat. An application of cantharides blister on the end of each teat might bring about a stimulation of that muscle.

FISTULOUS TRACT.

Mr. T. W. Clark has a two-year old colt which has a swelling on right foreknee which discharges matter every month or two; the colt cut its knee when very young and Mr. Clark took out a hard kernel a month ago, big as a marble. How should Mr. Clark treat the knee so that it will be cured?

Open the wound and remove all foreign substances and it will heal kindly by keeping it protected and syringing it out twice daily with a good antiseptic.

LUMP UNDER JAW.

I have a cow that has a swelling under her jaw; sometimes it goes away pretty much, and then comes on again. There is a lump about the size of a turkey egg; it is loose from the jaw, and now she runs a little at the nose. I have described in the picture as near as possible how it is. She eats all right. will you please tell me what I can do for it?—Subscriber.

Lumps under and between the jaw bones, such as you describe, are usually caused by some foreign substance producing an inflammation which may or may not superate. Lancing the enlargements usually results in its disappearance.

POSSIBLE ANTHRAX.

Editor Cultivator: I had seven strong healthy calves from two to three months old, fed on skim milk from separator; run on alfalfa. First noticed them drooping around and passing bloody urine. They continued to grow weak and would die in about 24 hours from commencement of trouble. Some calves had good appetite, eating within one hour of death. Would generally lie down about 12 hours after attack; would not get up again.—C. B., Kingsbury, Cal.

There is no cure.

REGISTERED BERKSHIRE HOGS and DORSET SHEEP

Land and Water

BY A. J. M'CLATCHIE, TUCSON, ARIZ.

EUCALYPTUS FOR HOT, DRY REGIONS.

About their names:—Before beginning a discussion of the subject proper it may be well to come to an understanding with the readers of the Cultivator concerning the names of these trees. The general common name adopted in Australia some years ago is "eucalypts," an Anglicised form of eucalyptus, the Latin name of the genus to which all belong. In speaking of these trees in general, then, we may call them by the Anglicised name, or may speak of them as eucalypti, the plural form of the Latin name of the genus, the former being simpler and for other reasons preferable. In speaking of a particular eucalypt, it is necessary in most cases to use the Latin name of the species. These trees have not been cultivated long enough yet for a very large percentage of them to have become known by common names. One species, Eucalyptus globulus, has a well established common name, "Blue Gum," in this country, although several different trees are called by the same name in Australia. In speaking of most of them, the only safe way is to use the botanical names. For example several quite different species are called "Red Gum," rendering this name too indefinite for use.

Diversity of kinds:—The genus Eucalyptus contains approximately 150 distinct species—not horticultural varieties, but botanical species—about half of which grow to a sufficient size to be of use commercially. Among the 75, or so, species that grow to the dimensions of good sized trees, are species suited to each of quite a variety of situations. Some grow naturally in swampy or very moist tropical locations, some grow best on cool mountain sides, a large number prefer situations that are moderately moist and moderately warm, while others endure great heat and a very dry atmosphere. It is of some of the last that mention will be made first, being in many respects the most important, because they grow where trees are scarcest and most needed. In most regions that are dry and hot in summer there is considerable frost during winter; hence species suited to such regions must endure both high and low temperature, as well as extreme aridity of the atmosphere.

Eucalyptus Rudis.—The most rapid growing species enduring the above trying conditions is, so far as known to the writer, Eucalyptus rudis, a comparatively obscure tree in Australia. It has proven very satisfactory at Fresno, and is the species now being generally planted at Phoenix. It is useful for shade, for a windbreak, for fuel, for posts, and for culver timbers, but is not so tough and strong nor so durable as some species. It has a more spreading habit than the Blue Gum and the bark is furrowed and persistent instead of smooth and deciduous. The leaves of the young trees are broad, but not opposite on the stem as in the case of the Blue Gum, being lang and slender on the adult trees, as on most Eucalypts. It is quite easily propagated, and bears transportation and transplanting well. The only present source of supply of the young seedlings in large quantities is the Fancher Creek Nursery, Fresno.

(To be continued.)

* * *

STRAWBERRY PLANTS.

Mrs. J. H. writes from Coldwater, Arizona, asking if Arizona Everbearing strawberry plants can be procured here for September setting. Plants of this variety formerly grown about Phoenix so extensively are now very scarce in Arizona, the home of this popular strawberry. This is due to the effect of the hot, dry weather and to the character of the irrigating water during the past few years, and possibly also to the custom of setting home-grown plants almost exclusively. So far as known, there will be no Arizona Everbearing plants for sale during the coming season, in the vicinity of Phoenix. There may be a limited supply at Tucson. Plants can be procured of California growers. However, plants cannot be successfully grown in our hot interior valleys from a September setting. November is as early as they should be set in such localities, and most years Arizona Everbearing plants do best if set during February and March.

* * *

EUCALPT SEED.

Mrs. M. B. C., writes from San Diego asking where seed of E. ficifolia, E. Crebra, and E. rudis can be obtained. So far as the writer knows, the only firm handling an extended variety of Eucalypt seed is the Germain Seed Co., Los Angeles. Seed of the first species named can surely be easily obtained, and at Fresno there are many trees of the other two, seed from which can probably be obtained through Geo. C. Roeding. The safest way to procure Eucalypt seed is to gather it from trees of established identity and characteristics. But as trees of the desired species are not always accessible, it is often necessary to order of a seedsman.

* * *

CONSERVATION OF IRRIGATING WATER.

A. L. C. writes that he is about to establish an irrigating plant, and wishes information as to the best methods of avoiding losses, his source of water supply not being stated. The methods to be employed depend upon the distance from the source of the water to the land to be irrigated, the value of the crops that are to be raised, the nature of the soil, and several other factors. In the vicinity of Phoenix and about Imperial where water is conducted long distances from a river, principally for the irrigation of grains and forage crops, open canals excavated through the soil are used. Upon account of the camparatively small value of the crop grown, the water must be delivered at the land at a minimum cost to the grower. In these so-called desert regions the soil is comparatively heavy and does not permit water to percolate rapidly. Moreover, the sides of the canals soon become coated with a nearly impervious layer of silt brought down from the watershed.

Where the crop to be grown gives high returns per acre, and the water is consequently very valuable, it is naturaly conveyed in cemented ditches or in flumes. The latter should be substantially made and securely placed at the outset ;and loss by evaporation from any form of conduit will be prevented by a cover. But more anon.

CROP CONDITIONS.

Nearly normal temperature and clear weather prevailed during the week in all parts of the state.

Grape picking is progressing rapidly in all sections, and raisin curing and wine making are well under way. The grape crop is heavy in most places, and a large yield of raisins is probable. Carload shipments of grapes to the east continue. The prune crop is reported somewhat lighter than usual, but of superior quality; picking and drying are in progress. Apples are abundant and of good quality. Almond harvest is nearly completed. Walnuts are ripening slowly. The deciduous fruit crop is being rapidly dried and canned. Citrus continue in good condition.

Bean harvest has commenced in the Santa Maria and Ventura districts; the crop is reported lighter than usual. Lima beans are ripe at Anaheim, and bean canning is progressing in Lake county. Hop picking is nearly completed and baling is in progress. The hay crop is mostly under cover and grain thrashing is completed except in a few places. Sugar beet harvest continues and the factories are in operation; beets on irrigated lands have yielded heavily.

WANTED—A JOB AS FOREMAN OF CITRUS orchards. I understand irrigation, fumigation, spraying, etc. Am a married man. Address P. KITCHEN, Tropico.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

"ITS PENNY WISE"

Policy to set out a good tree, costing good money, and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe avenue, Los Angeles.

ALFALFA FARM FOR SALE—

40 acres, (18 in alfalfa) well improved, three flowing wells with good pumping plant, almost new, with 500 feet of 6-inch irrigating pipe. Windmill with 2,500 gal. tank. Large barn, four-room house, all fenced and cross-fenced. Located one mile west of Hynes, 12 miles from Los Angeles. Price, $5,000.

J. W. GAINES, Hynes, Cal.

Nothing Succeeds Like Success

You Will Have Success if You Feed Your Hens Coulson's Egg and Feather Food

Coulson's Egg Food has been fed with success for over a year by many of the oldest and largest owners of poultry ranches in the State of California.

Geo. Gaston, who has about 2500 laying hens, feeds over 50 sacks a month of this feed.

Mark Hardin, who has about 3000 head of poultry, takes out four-horse wagon load every couple of weeks. Mr. Hardin says that the hens do much better on this feed than when fed on middlings, etc.; that when they are fed on Coulson's food they look well and are lively and spry and lay more.

P. Jensen, who has several thousand hens, feeds from forty to fifty sacks a month of this feed.

Walter Church, who has nearly 3000 hens, has been feeding Coulson's Egg Food for about a year, hauling it out by the four-horse wagon load; also C. C. Boysen, who has about 3000 hens.

These men are successful poultrymen, who have been raising poultry for the past ten years and longer and they know the value of good feed and proper feed for poultry.

So, when such men as these feed it and continue to feed it, it must be good.

Besides these gentlemen we have on our books the names of over 500 customers who live within a few miles of Petaluma. This speaks well for our home trade and our shipping trade is increasing rapidly.

Goods Brought From All Parts of the World.

Few realize the immense amount of goods purchased to make our Coulson's poultry foods. A carload of millet seed has been contracted for at St. Paul, Minn., to be delivered to A. R. Coulson & Co., Petaluma, by the first of November. Three carloads of prime cotton seed meal is to arrive in November and December from cotton mills near St. Louis, Mo. We buy flaxseed and oil meal from Oregon and shorts and middlings from mills in the State of Washington, contracting for them several weeks ahead. We get corn that comes from Kansas, rice from China, chile peppers from Japan, coaconut meal from Mexico, powdered willow charcoal that comes in car lots from the states of Pennsylvania and New York, high grade deodorized blood meal from packing houses in Kansas City, fresh ground butcher's bones shipped weekly from San Francisco, burnt bone, charcoal, from San Francisco, ginger root from Africa, fenugreek from France and

Germany, pepper from Japan, sulphur from France, ground eastern oyster shells from Atlantic coast, hulled oats and pea meals from San Francisco and other grains and feeds from all parts of the Pacific coast wherever we can get choicest feed at lowest prices.

If necessary we pay spot cash for our feed and feed materials thus getting the lowest prices.

Many think that all these things can be purchased right here. Yes, they can, but others ship them and reap the benefit of the high prices, therefore we seek to buy direct from starting point and save the middlemen's profit. By so doing we are able to make the very best of poultry foods and sell to the poultrymen all ready mixed and perhaps cheaper than he could buy the plain wheat. If you are in the poultry business, why not get two or three of your neighobrs to go in with you and purchase a carload of this feed and get the lowest prices and less freight.

Coulson's Egg and Feather Food, a balanced ration for laying hens, Coulson's Chick food for little chicks, Coulson's poultry foods are now for sale by more than 100 stores in California.

If no store handles it in your town, write to us and you can have it shipped to you by steamer or freight.

Just Off the Press, 10,000 36-Page Books, a combined catalog and poultry account book, free to poultrymen.

Petaluma Hens Fed on Coulson's Poultry Feed

RECOMMENDED FOR MERIT.

Petaluma, March 28, 1903.

A. R. Coulson, Petaluma, Cal.—Dear Sir: We have been feeding your chick and egg food for the last three months, and find them all right. The egg food is O. K. for when one feeds it he is sure to get more eggs.

And for the chick food, it cannot be beat, for our chicks are looking fine and our last batch of 310 is a week old and we have only lost two. The other hatch that came off on February 22nd are as tough as nails as they have been fed on Coulson's food right along.

We will continue to feed your foods to our little chicks and old hens.

Any one who has not fed the chick food to their chicks should give it a trial, and there will be one thing they will be pleased to find out—that they will not find many dead chicks in the brooder every morning. Attend to the brooder the way it should be run and the chick food will do the rest.

Wishing you success, we remain,
The Wild Flower Poultry Farm.

A. R. COULSON CO.

(Incorporated)

772-774 Main St., Petaluma, California

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

ANSWERS TO CORRESPONDENTS

Glorietta, N. M,, September 8, 1903.

Dear Editor: Will you kindly give me some information through the columns of the Cultivator? Is it all right to let the young pullets and cockerels run together, or should they be separated until they are developed? How soon after a pullet has commenced laying are her eggs suitable for hatching purpose? You say you use Lee's Lice Killer and Lambert's Lice Powder. I use the same and succeed by dint of the most strenuous effort in keeping the body lice pretty well killed off, although I can never get every last one. Are your fowls absolutely free from lice, and if so how many men would it take to keep a flock of 500 hens in this condition? I have only forty thoroughbreds now, but I am aiming at a flock of 500 and how on earth I am ever going to get through a flock of 500 by the slow process of putting two or three in a barrel at a time and afterwards dusting every one with powder is more than I can figure out. Is there no way of getting through it more quickly?

One thing more: When I start my breeding pens I, of course, want to segregate my best layers to breed from. Is it necessary in order to determine which are the best layers that every hen should lay in a trap nest? If so it seems to me that there is a pretty stiff job ahead liberating the hens. Do you recommend the nest that liberates the hen as soon as she has laid her egg, she carrying off with her a rubber ring around her neck with the number of the nest on it. By throwing some light on these (to me) cloudy questions you will oblige.—Subscriber.

It is best to separate the pullets and cockrels, they will both develop better if separated.

After she has laid her first clutch a pullet's egg can be hatched if she is a well developed pullet.

My fowls are practically free from lice. I keep them so by care, frequently examining them. I paint the perches with Lee's Lice Killer, keep a moth ball in each nest, and when I visit the trap nests to let the hens out I carry a little can of lice powder with a perforated top, examine the hen occasionally and powder her. When I find it necessary to put the hens in a box I have a large dry goods packing case, which will hold a dozen hens, paint a newspaper with lice killer at the bottom of the box, put a little straw in to keep the hens clean, leave them in the box from three to twelve hours. This is rarely necessary, as I give my hens good clean dust baths of road dust or earth and they keep themselves clean with the assistance of painted roosts, moth balls in nests and powdering occasionally.

The males require more care than the females, they are not as particular about their toilet, and if lousy will quickly affect the whole pen.

It takes one man's whole time to properly care for six hundred hens.

I have not tried the trap nest with the rubber ring, but think it would take fully as much time to find the hen and the ring after they have gone to roost at night, as my way of letting the hen out in the day time. If you are a real chicken crank you should be able to select your best layers by their gait and actions, put those few into a pen and test them.

I know of no better plan than the trap nest, and it pays most decidedly.

* * * *

FROM A CORRESPONDENT IN HONOLULU.

I am only an amateur and have about half an acre on the outskirts of Honolulu, and for five years have had very good luck, especially so during the last two years since I have taken the Cultivator. I could not possibly do without it now.

In regard to the absurd and utterly fallacious idea that mosquitos hurt the young chickens here, I proved long ago that it was not the case, by housing different broods of chicks in mosquito proof coops, only to find that they suffered as much as any others.

I learned later from the columns of the Cultivator that the trouble was "chicken pox" and cold in the head causing swollen eyes, and throat trouble, which being infectious spread very fast through the flock. I use your remedies and especially your "ounce of prevention" and have little trouble. Of course vigilance is the price of success as you have often told us, and I find I must be especially careful in damp rainy weather.—Mrs. J. H. S.

* * * *

Editor Cultivator: Your remarks in answer to one of my leters in regard to the coyote pest were splendid. But you left off the most important item, viz: The price of poultry and eggs. Only think of eggs, 25 to 30 cents per dozen. Turkies 16 to 18 cents live weight; chickens 12 to 15 cents live weight; ducks and geese, about 10 cents. I will not attempt to give the retail price, while the prowling coyote can be heard and seen prowling over our valley and no reward for his destruction. And when we think of efforts made to induce immigration to our land of sunshine and permit this scourge of civilization to remain, it looks the more startlingly inconsistent and unbusinesslike.—B. Walton, Compton.

In several counties of the state the matter of destroying coyotes is being persistently carried on, with encouraging results. In Humbolt, Mendocino and Sonoma counties premiums are paid on pelts of coyotes. In sections where these pests are most numerous great destruction of poultry of course exists. If there were a state law paying a bounty for coyote pelts it would soon reduce the damage done by these animals and in time work their final destruction.

POULTRY EXHIBITS AT THE STATE FAIR.

Poultry awards at State Fair, Sacramento, 1903:

Light Brahmas.

Mrs. F. H. Snow, San Jose, 1st on hen; 1st on cockerel.

OL' DOC HOPKINS.

Doc Hopkins, you bet, never put on much style;
His clo'es is all shiny—he don't care for that.
He sports an ol' stovepipe jest once in a while,
But most of the time its a floppin' gray hat.
No, he ain't noways slick,
But I take heaps of stock,
When I'm anyways sick,
In ol' Doc.

Doc Hopkins ain't much on these new fangled drugs;
He stan's by straight rhubarb an' quinine an' such.
He don't study microbes an' bactery bugs.
An' he ain't foolin' 'round with them X-rays, not much!
No, he ain't up to date,
But there ain't no half cock
In his ways. He's fust rate,
Is ol' Doc.

Doc Hopkins, he's jes a back number, I guess,
But he's doctored our folks for the many's a year.
He don't turn his back when a man's in distress,
But he rolls up his sleeves an' he straightens his gear.
He's a rough sort o' cuss,
If you're easy to shock,
But there's many that's wuss
Than ol' Doc. —Exchange.

VANITY.

The sun comes up and the sun goes down,
And day and night are the same as one;
The year grows green and the year grows brown,
And what is it all when all is done?
Grains of somber or shining sand,
Sliding into and out of the hand.
And men go down in ships to the seas
And a hundred ships are the same as one;
And backward and forward blows the breeze,
And what is it all when all is done?
A tide with never a shore in sight,
Setting steadily on to the night.
The fisher droppeth his net in the stream,
And a hundred streams are the same as one;
And the maiden dreameth her lovelorn dream,
And what is it all when all is done?
The net of the fisher the burden breaks,
And always dreaming the dreamer wakes.
—Harriet Prescott Spofford.

A ROMANCE OF ARCADIA.

Evangeline West was riding on an errand of grave import, but stopped long enough at the foot of a steep declivity leading to a brook to give her tired horse a long cool draft of the clear, swirling water before he forded the stream. He was a livery horse, hired at the railway station, no other means of rapid conveyance being available.

The young woman was home again after several years of absence during which she had improved her time and opportunities, and she was glad to return to her native heath, the land of Evangeline, the Arcadia of her heart. She looked far up the woodland brook with a fond appreciation of its enchanted beauty. Evergreen trees, pendant willows, silver birches and graceful elms fringed the banks; speckled trout leaped and splashed unafraid in the sparkling water. To complete the symphony a single musical note at intervals pierced the odorous silence—the call of the bellbird to its mate.

"Oh," cried the girl, longing to hear a human voice, "surely
This is the forest primeval.
In the Arcadian land on the shores of the basin of Minas,
"Here, too, is Evangeline, but where is her Gabriel?"

"At your service," said a strong, masculine voice at her ear, startling her so that she dropped her bridle rein over her horse's head. She turned and saw a man in clerical garb, one of the traveling preachers of the province, and looked at him ungraciously, annoyed at his quick application of her impromptu question addressed solely to herself. Giving him a cool nod, she attempted to secure her bridle which was entirely beyond her reach. Her horse, feeling its freedom, sprang forward, fording the brook with a rapid bound and galloping up the further side at a pace that nearly unseated its rider.

It would have served her right if the new Gabriel had left her to her fate, but after a lapse of time enough for him to observe her plight and, as she thought, angrily enjoy it, he rode up gently, not to hasten the speed of Evangeline"s horse, caught the errant bridle and restored it to her hand.

"Peter Grant, at your service," he said, touching his hat stiffly. "I am on my way to visit a sick woman. Pardon me," and with a leap his horse shot ahead and was gone.

"He knows how to ride a horse if he is a minister," thought Evangeline. "Peter Grant! Why, we were schoolmates, but he has forgotten me. Gabriel? Not that Scotch Presbyterian, with his books and preaching and his old-time views borrowed from Knox and Calvin."

Then she urged her horse forward, for she, too, was going to see a sick woman—her dearest friend, Aunt Maggie, who had been ailing for some time, and she had been delayed and had heard no tidings for some days. But such is the power of hopeful youth to look on the bright side and throw off dark forebodings that she found herself wondering how Peter Grant had succeeded in changing his troublesome red hair of their school days to a bronze brown, and what had become of the freckles that had marred his face as a youth's before he went away to the college at Wolfville.

"I must ask Aunt Maggie about him," she concluded. "He's a good-looking sort, although he did not promise much in the old days, and he knows how to ride and—he did not recognize me—that pleases me."

A few more miles of hard riding and Miss West reached a farmhouse of the old Arcadian type, with 50-year mosses on its unpainted roof and a well sweep of antiquated pattern picturesquely adorning the yard. Another horse was picketed there, and it saluted her with a cheerful whinny—it was the animal Peter Grant so vigorously bestrode.

"Oh!" she cried out in sudden alarm, "can it be possible that Aunt Maggie is the very sick woman he was coming to visit? I pray that I may not be too late!"

As she hurried into the kitchen she found it filled with women of the type of many of Aunt Maggie's neighbors, and a murmur of strange unmusical voices saluted her unwilling ears. They had never in their lives had a chance to peer into the cupboards of this house before; Aunt Maggis was not of their sort, and to Evangeline their presence savored of sacrilege. They all stared at the stylish figure in the tailor-made costume and they failed to recognize Vangie West.

"How is she? My Aunt Maggie—is she very ill?"

"Jest alive—that's all. The preacher—he's up there now—be you her sister's gal—what she brung up?"

"Yes, yes. What room is she in? Oh, take me to her. It is so long since I was here I feel like a stranger."

"What hendered ye from comin' sooner, miss?" asked a rasping voice, which Evangeline remembered as belonging to a layer-out of the community. Threading her way through the crowd the girl sought the room where her sick relative lay, a strange sound of monotonous singing leading her thither. There, tossing and delirious, lay the sick woman, burning with fever. The room was crowded with neighbors—women who gathered at a death with the scent of hawks, yet who felt—each one of them—that theirs was a religious duty. There, too, was Peter Grant, lining out a hymn which was only sung to the dying. As Evangeline entered they were chanting monotonously these hopeful lines: "For while the lamp holds out to burn
"The vilest sinner may return."

Women with corrugated brows and nasal tones sang the words in a weird discord, to which the preacher added a robust and melodious bass, for which effort Evangeline hated him. Singing such dreadful stuff to her dear Aunt Maggie, the saintliest soul that ever drew breath! She held up a vigorous hand and bade them stop.

"Don't you see that she is far too ill

My name on a lamp-chimney says, "Pay double for me; I give double light and don't break."

MACBETH.

How to take care of lamps, including the getting of right-shape chimneys, is in my Index; sent free.

for this sort of thing? All leave the room, please, and let her have air. I will take care of her now."

"She should be permitted to make her peace with God," the Rev. Peter Grant spoke, partly from habit and partly from conviction. He knew who this young woman was now, and dared to combat her aggressive action.

"She never had any falling out with Him," Evangeline said reverently, "but now that you know who I am and why I am here, you will leave her to me. I am her nearest relative, but more than that I am a trained nurse and thoroughly familiar with fever cases. Where is the doctor—she surely has medical care?"

"He has given her up," said one of the retreating women with a sly satisfaction.

"Given her up! How dared he? And why do you speak of such a possibility before her?"

"Oh, she doesn't sense anything that is said now," complained one of the cronies, taking a reluctant departure.

The preacher took himself off with the others, but he gained a reluctant consent to call the next day to learn how the sick woman was doing. He did not really expect to find her alive, and his slow, well-regulated faculties received a healthy shock when Vangie, ideal in her nurse's gown and white cap and apron, informed him that she had moved the sick woman from the south room to the north room, from which the stuffy carpet and obstructing furniture had been removed.

"I have telegraphed for ice and a modern doctor, and she is drinking cool spring water and is better already."

"And her immortal soul?" asked the man of God, humbly.

"I am more interested in curing her mortal body. Have you never heard of Aunt Maggie"s goodness and charity to all who need help and consolation—how she brought up a poor orphan child, gave her a home and the love of a mother, teaching her the value of right living and unselfishness? I was that child. And I am not going to let her die—not yet."

"And may I not see her again?"

"Oh, yes. You may come and preach the gospel of cheerfulness to her when I think her strong enough," and Evangeline gave her would-be Gabriel a wicked little smile that the man—not the minister—understood perfectly. It certainly is wonderful how that rascally god Cupid gets in his work regardless of time and place.—Chicago Record-Herald.

SELECTING A SECRETARY.

I once heard a business man say that the best secretary he ever had he selected wholly from her appearance. Thirty women came in one rainy day in answer to an advertisement. Twenty looked dejected and sloppy, and ten of the twenty had forgotten their umbrellas or overshoes. Five were overdressed, and had come in cabs. Four were silly, giggling little girls of fifteen or so, and one came freshly groomed, tailor-made, with crisp linen, stout boots, neat umbrella, and hair dressed for windy, rainy weather. He selected the last without recommendation, and found her just what he had judged from her appearance—a good worker and a wise associate.

Of course, some one of the dejected, wet tired girls might by chance have "panned out" an ideal worker with a few days' rest and a few weeks' salary for fresh clothes. Ability and real merit are often lost in the misery that comes from exhaustion and failure and fear. But the business man does not know these things. He is not blessed with second sight. He gets at his decision from experience, not from prophetic visions, and he does know that more than half the time the girl who looks careless is careless. And so, in a competitive examination of workers, men as well as women, the swift eye of the trained employer is pleased with external charm. His judgment becomes esthetic rather than profound—and really it is the best he can do. —September Woman's Home Companion.

HE WAS TIRED.

Barber—How will you have it cut, sir?

Peppery—Both short.

"Both? Hair and beard?"

"No; hair and conversation."—San Francisco Wasp.

RECIPES.

Stuffed Beefsteak is as nice for dinner as a much more expensive roast, and it can be prepared from a rather poor flank or round steak; pound well, season with salt and pepper, then spread with a nice dressing—many use some of the bread crumbs—roll up and tie closely with twine (which always save from the grocer's parcels), put it in a kettle with boiling water, boil slowly one hour, take out and place in a dripping pan, adding water in which it was boiled, basting frequently until a nice brown, and making gravy of the drippings; or you may put it at once in the dripping pan, omit the boiling process, skewer a couple slices of pork on top and add a little water, baste frequently, and if it bakes too rapidly cover with a dripping-pan. It is delicious sliced down cold.

How to make a nice gravy is a problem many housekeepers never solve. Remember that grease is not gravy, neither is raw flour. Almost any kind of meat liquor or stock soup, from which all fat has been removed, may be made into a nice gravy, by simply adding a little seasoning and some thickening; if browned flour is used for the latter, the gravy will require but little cooking, but when thickened with raw flour it must be cooked until thoroughly done, or the gravy will taste like so much gummy paste. It is best to brown a quart of flour at a time, just a light brown. Put in a skillet, set in oven or on top of the stove, stir often until it is light brown, put into a wide-mouthed bottle, cork and keep for use. All gravies must be stirred over a rather hot fire, as they must be quickly made, and must boil, not simmer.

WHEATEN GEMS.

Mix one teaspoon baking powder and a little salt into one pint flour; add to the beaten yolks of two eggs one teacup sweet milk or cream, a piece of butter, melted, half the size of an egg, the flour with baking powder and salt mixed, and the well beaten whites of the two eggs. Beat well, bake immediately in gem pans in a hot oven, and take out and send to the table immediately.

SPONGE CAKE.

Three eggs, one and a half cups powdered sugar, two of sifted flour, two tea-spoons of cream tartar, half cup of cold water, teaspoon soda, grated rind and half the juice of one lemon; bake in dripping pan.

SNOW CAKE.

Half teacup butter, one of sugar, two of flour, three-fourths of sweet milk, whites of four eggs, two teaspoons baking powder; flavor to taste.

THE GIRL WHO IS LOVED.

A woman cannot be said to be truly attractive or popular unless she is loved and admired by the members of her own sex as well as the opposite. She must be welcomed by all, old and young, male and female, or she cannot be called an attractive woman without reservation.

She must be herself, her best self, at all times and with all people; she must think and act for herself, and express her own opinions, rather than try to copy some person she may admire or who is admired by the lords of creation. Individuality, when combined with polite manner and tact, is always attractive. A woman's happy, infectious laugh is better than medicine or advice, and her cheery presence is as welcome as the sunshine.

A girl to be truly popular never says mean things about other girls, thinking that the men will like her better, and she doesn't try to monopolize the attentions of all the men at once, but is willing to let other girls have their share of admiration and attention along with her. She doesn't mope and retreat within herself if there are no men about to admire her, but she cheerfully sets about making the best of matters without them, and making such companions as she has happier and brighter for her presence.

If she has a grievance she keeps it to herself, for a woman with a grievance is very soon voted a bore. The weeping, fainting, sad-eyed young woman is very much out of style nowadays, not only in novels, but in real life, and the healthy, happy, independent, cheerful and sunny girl has totally eclipsed her in popularity.—American Queen.

HOME.

Blessed Word and blest estate
Lifting man to earthly Heaven;
Thrice blest again, is he by fate,
To whom Life, Work and Love is given.

HOMELY HINTS.

The Cure of Stings.—All sorts of stings—whether from wasps, bees, hornets or bumblebees—should be sucked to remove as much poison as possible; then have a slice of acid fruit, apple, tomato or peach, or a crushed berry, or grape, either ripe or green, bound lightly to the wound. If the pain is very severe after a minute take off the fruit, wash the sting in warm water and bathe it well in alcohol. Then wet a folded linen rag in either alcohol or vinegar, and bind on the sting. If neither alcohol, vinegar, nor fruit of any sort is at hand, try a bruised plantain leaf. Change the application, whatever it is, every ten minutes until the pain subsides.—Good Housekeeping.

Kerosene will remove ink stains and fresh paint while nothing takes out blood stains better than cold soapsuds to which kerosene has been added.

Irons that have been put away sticky should be well scraped with a thin knife, then rubbed with a rough cloth, moistened in kerosene.

A spoonful of kerosene in boiled starch keeps it from sticking, but do not use enough to make it smell of the oil.

When frying smelts, sprinkle with lemon juice before rolling in eggs and crumbs. It keeps the flesh white and gives it a good flavor.

New baking tins if given a good rubbing with fresh lard and then thoroughly heated in the oven, will be protected against rust. Indeed, lard or grease is better for cleaning them after they have been used than soap and water. And cake or bread dough is not so likely to stick. Whiting or soda rubbed on with a damp cloth will remove burnt stains from earthenware pudding dishes.

It's a good plan to take care of gilt picture frames yourself, they are so easily injured with vinegar or acid preparations. For their ordinary dusting, use a clean, soft dust cloth. When extra cleaning seems absolutely necessary, apply rain water with a few drops of ammonia. By the way, soft water is ever so much better for any domestic purpose, as everybody knows, because it is more dissolving.

President Thwing of Western Reserve University, says this about the ways in which students have worked their way through college. The records of our boards of education show many instances of these heroic efforts.

Not far from half of the students in American colleges are dependent wholly or in part on their own efforts for an education. The methods and forms of self-help which students adopt are manifold and interesting. I know of students serving as barbers, tailors, street-car conductors, clerks in gentlemen's furnishing goods stores, and grocery stores, selling meat, milk, and butter from carts; serving as watchmen on college grounds; distributing circulars and books; tollgate keepers; street-lamp lighters; janitors; sextons; choir masters; men-of-all-work about the house and in the house; waiters in public restaurants as well as in private houses. Of course in this work, too, are included various forms of assistance which are rendered in and through the college itself, such as secretaryships, assistantships in laboratories and libraries.

It may be said that a man who comes to college with a knack in hand and brain and with not a dollar in his pocket, provided his health be good, purposes high, ability great, will find such ways of helping others, and so of helping himself, that he can with assurance promise himself a first-rate education. Too many boys and girls think that the colege is indifferent to the student who is poor. Every such boy and girl should knock at the college portal. The door will open, and open inward, far more easily than they possibly thought.

BY ERNEST BRAUNTON, GLENDALE CAL.

RURAL SCHOOL GROUNDS.

Now that the time is drawing near for the opening of the fall term of school, interest should be awakened to the importance of beautifying the school grounds,

It is strange that a community will so often decorate a cemetery and allow the school grounds to remain bare. Would it not be better to care for the living rather than the dead?

It is certainly too late to benefit the latter yet not too early to instill a love of plant life into those who attend school.

Another strange fact coming under the writer's observation, not far from Los Angeles, was a community making strenuous efforts to raise a fund for the purchase of a public square and the ornamentation thereof, while their school yard of nearly the same dimensions was entirely bare of trees or plants.

Is it not strange, that the only piece of land in a district in which all have common ownership should be the most unsightly piece in the community No plausible excuse can be found for such conditions—it is so easy to get started right in California. The State University will always aid you in the matter of seeds and plants and few in the district but have plants or at least cuttings to spare of such as root readily with little care. This department of the Cultivator is ready to aid you in the matter of advice, list of suitable trees and plants or even with a hastily sketched plan. We are here for that purpose and are anxious to help such work along.

* * *

FERTILIZING CHRYSANTHEMUMS.

Experiments in feeding 'Mums, carried on by experts of the French Government, have brought out the fact that these plants need very rich food and that the following elements are essential in the order named: Phosphoric acid, Potash and Nitrogen, Their "complete manure" was composed as follows: Fish guano, 25 per cent; dried blood, 16 per cent; sulphate of potash, 24 per cent; double sulphate of potash, 24 pvbgkqjcmfw super phosphate, 35 per cent; The soluble manure consisted of phosphate of potash, 54 per cent; nitrate of soda 46 per cent; for a soil they advise two-thirds sandy loam with the balance of good leaf mold. Plants treated to large quanities of the above manure produced a marvelous crop of flowers.

* * *

A SHOWY NATIVE.

Just now the hills in the vicinity of Los Angeles as well as many other sections, are covered with Yucca stalks loaded down with the ripening seed pods. For a dry location or as a background or a cactus collection, nothing can surpass the Yucca either for beauty or general effect.

Our local species Yucca Whipplei is known as Spanish dagger or Spanish bayonet and is much prized the the world over, except of course at home. It is very easy indeed to grow from seed and the plants may also be transplanted from the hills at any time and with little chance of failure.

Where one has plenty of room to work a large mass of them the effect when in full bloom, is not surpassed by any tree or shrub.

Farmer Ragweed—Has Bill learned anything tew college?

Mrs. Ragweed—No; an' wuss'n that, he's forgot what he uster know. Says he can't eat pies without a fork.—Chicago News.

Los Angeles Markets.

Los Angeles, Sept. 17.

Conditions in the local market are not materially changed from last week. Butter is higher and firmer at quotation prices. It is an interesting fact that there are 1,300,000 pounds of butter in the warehouse at this time as against half this amount last year at this date.

Eggs remain firm at 29 and 30 cents a dozen for prime stock. Choice vegetables are quickly disposed of. Potatoes in first grade are in sharp demand. Hay and grain are firm notwithstanding a fine crop was harvested.

San Francisco Markets.

Dairy.

San Francisco, Sept. 17.

Butter showed a material increase in the past week, especially first-class grades. The market for cheaper stock was fluctuating, unsatisfactory, owing largely to the liberal supply on hand and the slow movement of the commodity.

Prices quoted are as follows:

BUTTER—Per lb.:

Creamery extras	.31	
Creamery, good to fancy	.27	@30
Dairy extras	.25	@26
Dairy choice	.21	@24
Store	.18	@20
California storage	.24	@26
Eastern Creamery	.23	@24

CHEESE—Per lb.:

Cal. Creamery, mild new, extra	14	@15
Cal. Creamery, mild new, choice....	13½	@14
Young America	14	@15½
Eastern, New York Cream	14½	@16

Eggs and Poultry.

There is no perceptible change in the egg market. Ranch eggs are offered in limited quanities and rapidly disposed of at firm prices. The movement in storage stock is liberal and a slight advance is quoted for the better quality lots.

EGGS—Per doz.:

Ranch, selected, large	37	@37½
Ranch, good to choice	32	@36
Store	Nominal	
California storage	25	@27
Eastern	20	@25

POULTRY—Old Roosters, per doz., $4.50@5; young Roosters, $5@6; Fryers, $3.50@4.50; Broilers, large, $3@4; small, $2.50@3; Hens, $4.50@6; Ducks, per doz., old, $3.50@4.50; young, $4@5; Turkeys, young, per lb., 20@23c; Geese, per pair, $1.50@1.75; Goslings, $2@2.25; Pigeons, per doz., young, $1.50@2; do, old, $1.50.

Fruits and Vegetables.

The demand for fruits in the past few days has been mostly confined to jobbers, but the local market has maintained a fairly steady tone. Four tier apples brought top quotations yesterday.

The season for the fresh stock is practically over and future offerings of first quality Fruit will doubtless be cold storage stock. Peaches were quoted at a lower range of prices.

Supplies of Prunes were limited and values showed a slight hardening. Figs were quoted at lower prices and the market was not cleaned up. Liberal quantities of fancy stock were left unsold late in the day. Cantaloupes held up well at the recently improved prices, but under increased supplies and cautious buying prices for Nutmeg Melons receded and the market was easy at the decline. Offerings of Watermelons were limited and firm prices prevailed. Quinces were in over supply and were offered at sharply reduced figures. Table grapes met with a good demand and the market presented a steady tone.

Wine grapes continued abundant and under limited trading the market leaned toward easiness, although prices showed no marked depreciation.

APPLES—Per box, common to choice, 25@75c; fancy, 85c@$1.25; Crab apples, per box, 40@75c.

PEACHES—Per box, 50@90c; carriers, 75@90c; large open boxes, 75c@$1; bulk, per ton, Clingstones, $20@27.50.

PEARS—Per box, No. 1 Bartlett, $1.00@1.40; common, 75c@$1; other varieties, per box, 40@85c.

PRUNES—Per box or crate, 50@65c.

FIGS—Per box, 40c@$1.

CANTALOUPES—Per crate, $1.50@2.50.

NUTMEG MELONS—Per box, 75c@$1.25.

WATERMELONS—Per 100, 20@35c.

GRAPES—Per small box, 25@65c; crate, 75@85c; large box, 60c@$1; as to variety; Wine Grapes, per ton, Zinfandel, 20@25c.

POMGRANATES—Per box, 25@50c.

QUINCES—Per box, 25@50c.

BERRIES—Per chest: Strawberries, Longworth, nominal; large varities, $1.50@4; Blackberries, $3@5.50; Raspberries, $4@6; Huckleberries, per lb., 6@8c.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal, as to quality; valencias, $1.25@2.50; Lemons, 75c@$2.50; extra, $3@3.50; Grape Fruit, $1@2; Limes, $6.

VEGETABLES—Tomatoes, per box, river, 40c@75; do, bay, 50@85c; Green Peppers, per box, Bell, 25@40c; Chile, 25@40c; String Beans, per lb., 2@3c; Wax, 2@3c; Lima, per sack, 75c@$1.25; Green Peas, per lb., 2½@3½c; Egg Plant, per box, 35@50c; Summer Squash, per box, 25@40c; Garlic, per lb., 2@3c; Green corn, per sack; 75@$1.50; crate. 75c@$1.75, Okra, per box, 35@50c; Marrowfat Squash, per ton, $10@$$12.50; Cucumbers, per box 25@40.

ONIONS—Yellow, per ctl., 50@70c.

POTATOES—Per ctl.: River Burbanks, 60c @$1; Early Rose, nominal; Salinas Burbanks, $1@1.50; Sweet Potatoes, $1.75@2 25.

The movement in river Potatoes continues small, but under light receipts the market was reported yesterday steady at former prices. Bids of 75c were still made by shippers, but sellers were unable to meet this figure. Salinas Burbanks were offered at cheapers rates, supplies being heavy and somewhat excessive. The local trade is now running mostly on this variety and the outward movement at the decline was reported fairly good. Sweet potatoes were offered at still lower rates, supplies greatly exceeding current needs. Onions were steady at former prices.

Dried Fruits, Nuts, Etc.

Keen interest is shown in all lines of Dried Fruits, says the San Francisco Chronicle, by the buying element and the local market presents a firm tone at strongly held prices. While Peaches still lead in point of demand under brisk speculative buying, the demand for other Fruits is of liberal proportions and the aggregate sales are exceptionally large. Prunes are meeting with a good demand and shorts filling in on October delivery contracts are paying well up to the top rate for available offerings. Holders are slow to part with their stocks and indications tend toward a hardening of values. Honey is steady at quotations with a fair outward movement reported.

DRIED FRUITS—The following quotations are made on car load lots f. o. b., to all California shipping points for 1903 crop. Per lb. the prices are:

APPLES—Evaporated, 5@6c.

APRICOTS—Royal, fancy, 9@9½c; choice, 7½@8½c; Moorparks, choice, 9@11c.

PEACHES—Choice, 5¼@6½c; fancy, 7@7½c; peeled, in boxes, nominal.

PEARS—Choice, 6@7c; fancy, 8@9c.

PLUMS—Pitted, 5@7c; unpitted, 1@1½c.

FIGS—White, 4½@5c.

NUTS—Per lb.: California Almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard, 7@8c; Pecans, 11@12c; Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c;

HONEY—New Comb, per lb., White, 12@13c; Light Amber, 11@12c; Extracted Water 6¼c; three-crown, 6¼@6½c; four-crown, 6¾@7c.

BEESWAX—Per lb., 30c.

Peanuts, Eastern, 5½@6c; do, California, 5@6c; California Walnuts, soft shells, 12@13c; Chestnuts, Italian, nominal.

Live Stock.

Former prices for the various offerings of Live Stock are maintained with a marked degree of steadiness and the market reflects the characteristic features fully reviewed for some time past.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin steers, 6½@7c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES.—Light, per lb., 5@5½c, gross weight; heavy, 4½@4¾c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½@4c, gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

4¼c, gross weight; Ewes, No. 1, 3¾@4c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb. live weight.

HOGS—Per lb; Hard grain-fed, weighing alive, 140 lbs and over, 5¾@6c; weighing under 130 lbs, 5¼@5½c; weighing 260 to 350 lbs, 5½c; rough heavy, 4½@5c.

Hay and Feed Stuffs.

STRAW—Good to choice, per bale, 45@60c.

FEED CORN MEAL—Choice grades, per ton $33@34.

HAY—Prices on New Hay, per ton: Wheat, $11@15; Wheat and Oat, $10@13; Oat, $9@12.50; Barley, $8.50@11; Clover, $9@10.50; Alfalfa, $9@11.50; Stock, $8@9.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@28.

BRAN—Per ton, $23@23.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

CRACKED CORN—Choice quality, per ton, $33.50@34.50.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@4.85 per bbl.; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—New crop: No. 1 Shipping, per ctl., $1.43¾; choice, $1.46¼; White Milling, good to choice, $1.50@1.60.

BARLEY—New Crop: Choice, No. 1 Feed, $1.12½@1.16¼; Shipping, $1.17½@1.20; Brewing, No. 1, $1.20@1.25; Chevalier, $1.35@1.50.

CORN—Good to choice, per ctl.: California, new, large Yellow, $1.50@1.55; small do, $1.75@$1.80; White, $1.50@1.55.

RYE—Good to choice, per ctl., $1.22½@1,28¾.

OATS—Feed, good to choice, per ctl., $1.22½@$1.32½; White Milling, $1.32½@1.37½; ;Red, $1.20@1.32½; Black, nominal at $1.40@1.60.

BEANS AND SEEDS.

A moderately active demand for shipping purposes holds the market for Beans steady at quotations and general conditions are reported quite favorable to the selling interests. Small Whites and Limas are held well in hand at full figures. The receipts of new-crop stock are slowly increasing, but aggregate arrivals are still too small to depress prices for last season's yield. Seeds continue largely nominal.

BEANS—Prices per ctl.: Large Whites, $2.50@2.85;; small do, $3@3.15; Peas, $3.25@3.50; Lima, $3.40@3.50; Red, $2.90@3; Pink, $2.85@3; Bayo, $3@3.25; Blackeye, $2.50@2.75; Kidneys, nominal.

NEW CROP—Large Whites, $2.50@2.75; Blackeyes, $2.50@2.75; Red Kindneys, $3.75@4; Bayo, $2.90@3.10.

DRIED PEAS—Green, $1.80.

SEEDS—Prices per ctl: Yellow Mustard, $2.50@3; Trieste, $2.75@3.25; Canary, imported, $5.50; Hemp, $3.50; Flax, $1.75@2; Rape, $$1.75@2.50; Timothy, $5.75@6.50; Alfalfa, nominal.

Hops.

The price for new crop is 21@25c per lb, according to quality.

Wool.

The local Wool market is quiet, as scourers are unwilling to make large purchases pending the outcome of the strike of the scourers and handlers of wool. The Eastern Wool market is unusually quiet and this will tend toward prolonging the local labor troubles. At St. Louis prices are quoted: Medium grades, 16@21c; light fine 15@17½c; heavy fine, 12@14¼c; washed, 20@30c.

Eastern Markets.

Grain and Produce.

CHICAGO, Sept. 16.—Speculative interest centered in the corn pit today and trading was active. December closed with a net gain of 1¼@1⅜. Wheat opened with considerable activity on the sharp upturn in corn, with December ¼@⅜ to ½@⅝ higher at 82⅞ to 83⅛. But the news from the Northwest soon became more reassuring with foreign news rather tame and these influences, together with a sharp break in September at Minneapolis, caused the strength to desert the pit and December relaxed to 82¼c. Local traders followed the action of brokers supposed to be acting for Armour, who sold wheat generously. Trade was large and the late markets took on a better tone on a firmer tendency in the late cables and a recovery in the Northwest markets. December closed unchanged at 82@82⅝. Shorts in the corn pit made a concentrated rush to cover at the opening and the bidding continued vigorously until the price had gained 1½ cents on the closing quotations of last night. But at the advance, offerings from holders with profits became so free that they checked the upward movement, the selling being led by traders who took advantage of the slump yesterday and took on what proved to be cheap corn. The late market showed a divided sentiment, but there was little short selling. December closed strong at 52½@52⅝, a gain of 1¼@1⅜c, after ranging between 51⅛@51¾ and 52. The oats market was strong with light offerings. December closed ⅝@¾ cents higher at 38¾@38⅞. Provisions were strong with corn and higher hog prices.

Cash quotations were as follows: Flour was 20c higher; No. 2 red wheat, 80¾@82¾; No. 2 corn, 52½; No. 2 yellow, 54; No. 3 white, 37¾@39½; No. 2 rye, 57@58½; good feeding barley, 48@51; fair to choice malting, 53@59; No. 1 flax seed, 1.04; No. 1 northwestern, 1.09; prime timothy seed, 3.10; mess pork, per bbl., 13 60

CHOICE OF 3 ROUTES

EAST AND WEST

"SUNSET" Via El Paso and New Orleans

"OGDEN"

Via San Francisco and Portland "SHASTA"

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

California Dried Fruits.

CALIFORNIA DRIED FRUITS.

NEW YORK, Sept. 16.—The market for evaporated apples is quiet. The new fruit arriving is of ordinary quality and prices favor higher prices with quotations ranging from 5⅝ to 5½ for prime October-November delivery. Common, 4@5; prime, 5¼@5¾; choice, 6½, and fancy at 6½@8. Prunes in moderate demand and the general market shows little change, with prices still ranging from 3¼ to 7 for all grades. Apricots firm; choice quoted at 9¼@9½; extra choice at 9¾@10¼ and fancy 10½@12. Peaches are steady, with a quiet demand, choice quoted at 7¼@7¾ and extra choice 7¾@8¼.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

Los Angeles, Sept. 17.

Orange Markets.—Conditions have improved somewhat during the past week in the auction markets, Wednesday's sales showing very satisfactory prices at nearly all points. The supply in sight and en route is small, and would seem to warrant equally satis factory results on sales in the near future.

Western markets continue to take fruit very slowly and with little change in the way of prices.

There is considerable complaint as to quality, much of the fruit going forward showing the effects of cold weather and is generally rough and poor color.

The lemon market has been in fair condition, especially for 300 sizes, in the northern markets, where the demand for Californias has exceeded the supply available. Shipments en route are very light, and anything in the shape of a desirable car is readily saleable. Fruit of poor quality and in bad condition is not wanted.

Californians would increase their profits and business by throwing away more of their worthless stock instead of sending it East to demoralize the markets.

The citrus fruit year is about closing, only 100 cars of Valencias remaining to be disposed of, with the usual average shipments of fall lemons. Locally the feeling in regard to the California Fruit Agency has become settled, and it is now conceded on all sides that the agency has become a permanent factor in the handling of almost the entire citrus fruit crop of this state. In the East the trade is equally pleased, excepting the firms that have been left out as brokers or commission merchants. The bona fide purchasers of fruit now feel that they will be protected in their ownership of the oranges and lemons bought from the agency, as the latter will control almost the entire crop.

A. H. Naftzger left for the East a few days ago on his annual tour of the leading market towns. His most important business is overlooking the general make-up of the agencies and making a general review of trade conditions. He will be gone about six weeks, during which time Mr. Naftzger will visit all the leading markets of the country. About the first of December the California Fruit Agency will occupy the upper floor of the Chamber of Commerce building on Broadway. It is stated that the entire floor will be taken by the agency, the Exchange, the Citrus Union, the Semi-Tropic Fruit Exchange and a number of members of the Union, such as the Earl Fruit Company, Fay, Spruance and others. When this move is consummated, the agency, with its constituents, will be housed more conveniently for the transaction of its immense business.

Citrus Fruit Shipments.—Shipments of citrus fruits from Southern California for the season from November 1, 1902, to date, are 21,955 carloads, of which number 2610 carloads are lemons.

Crop advices declare that in two weeks more the bulk of the corn crop will be out of danger of frost. While this is not going to be a year of large crops, still no serious deficiencies are to be expected, and a good demand at profitable prices is assured for nearly all agricultural products, the beneficial effect of which upon general business need not be enlarged upon.

Secretary Wilson says this country, this year, will produce 10,000,000 bushels of Maccaroni wheat as against 2,000,000 last year, and he predicts that next year's crop will reach 20,000,000. He is taking steps to ascertain where the surplus may in 1904 be marketed abroad.

The country never before saw such demand, and such growing demand for leguminous seeds for sowing—the clovers, alfalfa, the vetches, peas and cow peas, and soy beans and velvet beans. Numerous reports state that the farmers have just been awakened as from a long sleep, and that they are feeling their way with rotations in which a part is generally taken by a legume, and the awakening is often referred to as beginning at a farmers' institute.

'TWAS EVER THUS.

The rain it falls upon the just,
And, too, upon the unjust fellows;
But more upon the just because
The unjust have the just's umbrellas.
—Judge.

The American Poultry Association hold its next meeting at Rochester, N. Y., February 2.

SUMMONS.
No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 14 day of Sept., A. D. 1903.

C. G. KEYES, Clerk.
(Seal) By C. O. Winters, Deputy Clerk.

The Orange Industry in California

BY J. W. MILLS, POMONA

The coming orange crop promises to be the heaviest that California will ever have produced. Last year's crop fell short of early estimates and even if the coming crop falls as far short of present estimates, we will still have a record breaker. During the past three years, nurserymen have been unable to supply planters with orange trees. We cannot gauge the coming increase in production entirely by the new acreage for a great deal of it is on land or in situations entirely unfit for growing oranges that will pass muster during a season of moderate prices and a weak demand. Nevertheless, this fruit will have a tendency to lower the price of oranges and will serve to bring about a reaction in planting more quickly. Early shipments from the northern citrus belt are already having an influence on prices when the market first goes up. Some shippers have told us that they began two years ago to take the edge off of the early market that the southern orange growers have enjoyed.

Navels and Seedlings.—The Washington Navel seems to hold the market during its season against the seedling fruit. The latter used to have a good market late in the season, but the superior quality or the Valencia seems to have supplanted it to considerable extent. The seedling does not seem to have a bright future with us and no doubt, a few more years will see the greater part of them budded over to Navels. The loss from this source will perhaps have no effect on the present supply for so many seedlings have been worked over during the past few years, that are just now coming into bearing. If the grower had no expenses except those of cultivation, irrigation and marketing. there might not be very many losses in orange growing, but the expenses incurred in fighting pests will perhaps always create considerable loss. All these things will have a tendency to restrict planting to a certain degree.

Budding Over Old Tress:-This operation is quite well understood at this time. There are certain points in the operation that are vital and a disregard for them will result in the loss of many fine trees. A large orange tree that has been beheaded and loses its new head the first year by frost or improper manipulation, will never be worth working afterwards. The practice of budding into large branches during the fall and early winter and allowing the buds to remain dormant is all wrong. The bark often overgrows the bud to such an extent as to smother it. The best success is obtained by budding in the spring after the first growth starts. All of the surplus branches not needed in forming the new top should be sawed off close and waxed over. This starts an unusual flow of sap into the remaining branches and healing of the bud is much more rapid. The cuts to receive the buds and insertion of the buds must be done quickly and wrapped at once with strips of cloth saturated with beeswax. These bands should be well disinfected with a weak solution of bluestone water and then rinsed in clean water and dried before using. This may not be necessary in most cases, but some seasons, great numbers of buds are lost by the growth of mould under and around the buds that are inserted. To be perfectly secure against this trouble, spraying the trees with Bordeaux mixture may be advisable. The bands should not be removed under one month if the spring is warm and the growth of the trees is rapid and vigorous. If the spring is cold and backward, failure will surely follow the removal of the bands under six weeks. If the trees are in a frosty location, the branches should be girdled about two inches above the buds as soon as the bands are removed. If there is but slight frost, the tops should be sawed off just an inch above the buds, the stumps painted with wax and the trunks of the trees whitewashed. In a short time the inserted buds and innumerable adventitious buds will appear. The latter should be rubbed off and when the sprouts which go to form the new top are about a foot long, they should be pinched at the ends to make the branch and harden the wood. When the top is left on and the branches girdled above the buds, the same conditions exist, except that the tops are removed in the following spring when the new growth starts. The retention of the tops over the buds acts as an umbrella and the young growth will not suffer from frost. Ordinarily removing the entire top at the time of taking off the bands and wrapping the young growth in the fall with palm leaves will give a better growth than girdling and leaving the top on the first year. The latter is the best way where extraordinary frosts occur.

* * *

Thinning and Propping.—Thinning has never been practiced on the orange, it being considered wasteful. Props that will hold up a crop that would break down a tree, have paid for themselves many times in the past in fruit. The orange, especially the Navel, grows large enough for the market even when the trees are loaded, so thinning has an objection there. Still it may be that much may be gained by thinning. Fruit that is disfigured or in places that are exposed to the ill effects or wind and hot sun might be removed at this time, thus saving the expense of handling and at the same time relieving the tree of the extra drain. We have often seen a large percent of fruit on some trees that showed a whitish appearance on one side when green and when ripe the rind of such oranges is always off color, thick and dry and goes either into culls or low grade fruit. If such fruit were cut off now, much loss would be avoided. There are certain blemishes that are visable on oranges now, that will disappear when the fruit matures. This class of fruit will often turn out to be perfect or nearly so; experience will teach growers what to leave and what not to leave. Fruit that has blemishes now should be observed from time to time to see what changes take place. Shipping tags with description of the different faults written in lead pencil and tied on a number of specimens of fruit will make the records of the observation reliable. There is no reason why "sure enough" culls should not be taken off now.

* * *

There are several methods of propping orange trees. Some growers use poles as a center piece from which to run ropes to branches that need propping. Our experience has been that such a principle is wrong, for the reason that it is difficult to decide where to tie to the branch. If the tie is made too far out, the branch will sometimes double up with weight of fruit. We have often seen branches swing sideways and split when tied in that way. With a board prop that rests on the ground with the limb in a crotch, the operator can judge in a moment where to place the prop. if wrong, he can adjust it in a seconds time. If the foot of the prop is placed so that the top points outward, it assumes the proper position and is not so apt to be displaced by the cultivator or any other thing in passing. It also allows the branches to sway in the wind without being displaced. There are several patent props on the market that do the work well. We dicededly prefer those that prop from the ground.

Improvement Of The Orange.—This may be accomplished chiefly in two ways, selection of variations of buds of the Navel orange and by fertilizers. The former can only be employed in future planting or in working over growing trees. Fertilization scientifically done is the only rational means of improving the products of groves that we now have. The results from the use of commercial fertilizers has more often than not, been very unsatisfactory, the results have not been up to expectations. Recent investigations by Mr. F. L. Palmer of Pomona have shown that all available knowledge on the subject of fertilizing the orange in California, is not so definite as it might be. The opinions of prominant growers are equally divided on some very important points. General results show however, that best results are obtained by applying complete fertilizers during the spring and summer. Nitrogenous fertilizers should never be applied during the winter time as it will have a tendency to lower the grade of fruit and start the growth of the trees at the wrong time of year. Reports would indicate that summer and early fall are the proper time to apply potash. Phosphoric acid should be applied so as to be available at the time that the nitrogenous fertilizers are used by the trees; it should therefore be applied early in the spring, say about February. It must be remembered that there are no strict rules for applying or using fertilizers, as it is a difficult problem at the best and no kinds of land can be treated alike with any certainty. One thing certain, green manuring crop will have to be grown if an ideal condition of the soil is to be secured. This is the life giving element of soil and fertilizers give better results when applied to soils rich in humus than when applied to those poor in it. At the present time, we do not know that there is

A WELL-TENDED ORANGE GROVE.

EGG MEN IN BUSINESS FOR THEMSELVES.

The poultrymen of Sonoma county, who have had much experience with middle men, have shaken loose, and set up in business on their own account, endeavoring to entirely eliminate the go-between who got the cream of their labors and to reach the consumer direct, without his intervention. 'From the hen to the table" is their motto, and they seem to be making a success of their new movement. The fruit growers of the Sacramento river started out along these lines over a year ago, and after many troubles, trials and tribulations, succeeded in compelling the middlemen to leave them alone, and their labors have been eminently satisfactory to themselves. The egg men of Sonoma county are following in their footsteps and will achieve success with less trouble. They have established an agency in San Francisco where they are marketing their own products and are saving three cents a dozen by the operation, besides escaping many little unpleasantnesses to which they were subject under the commission system.

PANAMA CANAL TREATY DEAD.

Negotiations which have been pending with the Columbian congress for some months relative to the ratification of the Panama canal treaty have come to an end by expiration of time allowed by congress for the completion of the treaty.

It now rests with the President to proceed with the consideration of the Nicaragua route, or pass the matter over until the next congress meets in December. A report was current in Washington that the Colombian congress in secret session had clothed President Marroquin with full power to negotiate a treaty. If this should turn out to be true, President Marroquin, who is counted as a friend of the treaty, could proceed untrammeled by the fear of future reckoning with his congress. Again, if this should prove to be a fact, negotiations may be opened later on by an act of congress.

THE FIRST FRUIT INSPTCTOR APPOINTED.

The fruit growers of Watsonville have moved in the matter of having the law which requires packers to label their fruit with the name of the section in which it was grown, properly enforced. This is the law which was passed by the last legislature and to which we recently drew attention in these columns. It is evident that Watsonville has no intention of allowing other sections to get the credit for her choice products and to this end a petition was presented to Governor Pardee begging for the appointment of A. N. Judd as fruit inspector, under the new law. In accordance with the request, so preferred, Governor Pardee on Friday last, appointed Mr. Judd as fruit inspector for Santa Cruz and Monterey counties. This is the first appointment under this law and it will probably be followed by others, and what has heretofore been a great injustice to some sections of the state in giving to other sections the credit for the choice products will be stopped. Mr. Judd is a competent and fearless officer who will see that the law is properly enforced in his district.

THE RAISIN ASSOCIATION STILL ALIVE.

The raisin growers have worked their way through the Valley of Tribulation and entered the field full armed for another season's campaign. The raisin men are to be congratulated on their good sense in hanging together for their own interest, although for some time it seemed as though they were determined to fight each other and sell their crops for hog feed. There is now 91 per cent. of the raisin crop of the state represented in the association, and it is in a position to fix prices, which it has done at a material advance on those heretofore prevailing. There is an estimated raisin acreage in the state of 64,000, of which 58,239 acres have been assigned to the association. It was a surprise, and shows some skillful engineering on the part of the management, when the Woodland Sultana Raisin Growers' Ass'n. cast its lot with the Fresno people. This body absolutely declined to sign up with the Fresno combine, but after two unsuccessful attempts to reach an agreement with the management at Fresno, some concessions were made which brought the Woodland people into line. Prices have been fixed for the new crop as follows: Two-crown loose muscatels, 6¼ cents; three-crown loose muscatels, 6½ cents; four-crown loose muscatels, 7 cents. This is the highest in the history of Fresno. These are pretty steep prices in comparison with what have been paid for raisins in the past few years, and will probably be shaved considerably before the crop is marketed.

E. J. Norcross in the Exeter Sun gives the figures for planting a seven acre orange orchard. Of course the cost of an orchard depends a great deal on what is paid for land, it ranging in price from $40 to $100 per acre, depending on whether water is developed or not. For the orchard cited water was purchased from an adjoining tract. The following are the figures as furnished us:

Cost of seven acres of land	$280
Trees at 85 cents each	600
Leveling land	75
Planting at 5c per tree	35
Water	80
Total	$1070

This does not include the labor expended upon cultivating and irrigating which can easily be done by the owner with but little expense. The cost during the subsequent years will be only the cost of water and taxes.

Milk inspectors should be doing more than earning their per diem now days. They should thoroughly inspect all the milk sold in every city and town where they work and when they find a dishonest vender arrest him and see that he is vigorously prosecuted. More sickness and death come from impure milk than almost any other cause. Pure milk is health, impure milk death.

Jars make excellent packages for the farmer to pack his butter in. Where he is supplying a regular trade he should employ jars of a uniform size.

THE APPLE INDUSTRY.

The Apple Growers' Association of Los Angeles county is engaged in a most important work—the work of advancing the interests of the apple industry in this county and incidentally, promoting the general welfare of the industry throughout Southern California.

For many years the idea obtained that good apples could not be produced in this part of the state. It was urged that the climatic conditions are against the development of this fruit in this locality.

Of course, Central and Northern California have always produced a fine variety of apples and the efforts of the Apple Growers' Association of this county is being directed to ascertaining the necessary conditions which will make apple growing profitable as it is in other sections of the state. It has been demonstrated by intelligent growers like Mr. Wilson of Long Beach that certain varieties of apples may be grown in this part of the state as satisfactorily as they are at Watsonville. Somewhat more attention is necessarily given the trees but the results of the last two years have shown that good money may be made from orchards well taken care of. If apples are well preserved they will sell well.

The meeting of the Association for this county, on Saturday last, brought out considerable well-merited discussion on the best methods of maturing and preserving the crop. Frederick Maskew, gave as a reason why trees have not borne regularly that they have been damaged in picking, the pickers have broken the limbs and otherwise damaged the tender sprouts. with the result that the succeeding years' crop has been materially lessened.

It developed in the discussion that this county does not appear to furnish two-fifths of the apples consumed in this market. In the first place proper care has not been excercised in picking and preserving the fruit, and in the second place orchardists have allowed themselves to be imposed upon by dealers who insist on labeling the best fruit raised in the county as from northern points where popular varieties abound. Against this discrimination the Association emphatically objects, and insists that Los Angeles county apples shall be sold on merit and that proper credit shall be given growers who produce fruit of equal value with the growers in other sections of the state.

Discussion on spotted apples brought out the point that the shot-hole fungus is the cause of this disorder to the apples. The fungus grows in the bark of the trees and in summer develops, spotting the fruit much as the canker does in the East.

Horticultural Commissioner Jeffrey called attention to the fact that George Compere had found an effective parasite for the codling moth. This information was received with much satisfaction by the members of the Association for as has been stated in a recent publication:

"This moth is the most destructive fruit pest upon the face of the earth, and is found universally where the apple is cultivated. Governmental statistics show that from one-fourth to one-half of the apple crop of the United States is totally destroyed, or materially injured by this pest."

It is certainly to be hoped that Mr. Compere has really discovered the parasite that will destroy the codlin moth, which not only causes an immeasurable monetary loss to apple growers but attacks with almost as fatal results pears, from the ravages of which the growers of this most choice fruit have almost wholly abandoned its culture.

If property owners would cut the weeds around their orchards there would be less black scale. This idea the Cultivator has so often urged. The Corona Courier reports Horticultural Commisioner Curtis as saying that the black scale is found in the largest quantities on the "deadly nightshade" weed, which grows around in lots of orchards, and not only does the scale confine itself to the leaves and stalk of the weed, but penetrates down into the ground and is found on the roots. He says that where the weeds are thick so is the black scale prominent.

FRUITS AND REFRIGERATION.

Fruit growers will be greatly interested in the test to be given cold storage of fruits at the World's Fair, at St. Louis in 1904. A completely equipped mammoth cold storage warehouse and refrigeration plant will be in operation on the grounds and all tests will be of the most practical character. It is asserted by those interested in this experiment that fruit shipped from the most distant parts of the country will be preserved in all its beauty of colors, its texture and flavor. The strawberry grower of California will be able to present his exhibit on the tables in the exposition in perfect condition.

The apple and pear raiser will ship his products to the storage plant this fall and next summer show them in as good condition as if gathered within a few days of their exhibition. It is wonderful what advancement has been made in mechanical refrigeration in the past few years. Cold storage has revolutionized the apple industry, solving the problem of the over-stocked market, preserving to the orchardist a demand for his fruit which otherwise he would have lost. A bulletin issued by the Department of Horticulture for the World's Fair gives the information that the officers appointed to look after this branch of the Fair, are planning to assist the Commissioners of the various states in storing their products for exhibition in 1904.

The Exposition management, appreciating the importance of the cold storage industry, has established the Bureau of Refrigerating Building, 320 by 210 feet, with a model cold storage warehouse of more than 300,000 cubic feet capacity.

As the Exposition will positively open on April 30, 1904, and the space in the Palace of Horticulture assigned to each state must at all times be covered with fresh fruits, the months of May and June next year will necessarily witness the display of apples kept in cold storage. As it has been demonstrated that apples may be kept perfectly in cold storage for two years it is reasonable to assume that during the first two months of the World's Fair, and longer if need be, perfect specimens of fruit will be daily exhibited.

MAYNARD PLUM CATALOGUE.

One of the most successful of experiments of that wizard of horticulture, Luther Burbank, has been the production of the Maynard plum. This plum is so large as to attract attention anywhere and of a color which will attract attention and command for it the highest market price.

Regarding the plum the catalogue recently issued by the Oregon Nursery Co., of Salem, Oregon, says:

In size it is very large, often measuring seven and one-half inches in circumference. Form nearly round, slightly flattened at the ends, of richest, crimson purple, deepening to royal damask as full ripeness is reached. Tree hardy, vigorous and compact grower. Leaves dark glossy green. Bears immense crops of even sized fruit while very young. Never fails.

THE RANCHER MUST DECIDE.

There appears to be no cessation of interest in the discussion among orchardists as to the respective merits of spraying and fumigating. At several institutes held this fall the concensus of opinion was in favor of spraying—if properly done. Positive expressions were given that it is not only safe and effective, but so vastly less expensive as to render it much more desirable than fumigating. At Covina, however, recently the Orange Growers' Association passed resolutions to the effect that fruit sprayed shall hereafter be rated by itself as they consider sprayed fruit injurious to the grade.

In opposition to this theory the manager of the Charter Oak Association states that 90 per cent of the fruit which passed through his house last season was sprayed, that no injurious results were noticeable, that fruit treated with spray did not require washing and that the members of the Charter Oak Association received a higher average price for their oranges than any other association in the district. That fruit is damaged by spraying no experienced orchardist denies, and the same can be said of the orchards which have been carelessly

treated by the fumigator. It seems certain, however, that orchardists should exercise the greatest care in their selection of both sprayers and fumigators. Under no circumstances should an inexperienced or careless person be allowed to go into an orchard for the purpose of treating it by either method. And another thing, no orchardist should pay for the work done on his trees until the Horticultural Commission inspects the work of the cleaner and ascertains if the scale has been thoroughly eradicated. By adopting this plan much damage will be avoided and good clean work will be done on all the orchards. The honest sprayer and the honest fumigator ought not to be dissatisfied with a contract which makes his work dependent on the judgment of men of experience and knowledge both of which the Horticultural Commissioners in the various counties of the state ought to possess.

CROP CONDITIONS.

The Weather Bureau reports the following conditions as existing in California during the week ending September 21:

The temperature was nearly normal and the weather generally clear in the interior during the week. Fogs prevailed in the coast districts. Light frosts occurred in some sections. Conditions favored fruit drying and raisin making, now in progress in all parts of the state. The first crop of raisin grapes is nearly all gathered and on the trays, and the second crop will soon be harvested; both crops are reported heavy in most sections and of excellent quality. Wine grapes are going to wineries in large quantities and heavy shipments of Tokays and other table grapes continue. Prune picking and drying are in progress and nearly completed in some districts; the fruit is of excellent quality, but the yield is slightly below average. Other varieties of deciduous fruits have yielded heavily and are nearly all secured large shipments of dried fruits are being made. Citrus fruits are in good condition in all sections, and oranges in the Oroville district have commenced ripening. Apples are ripe and yielding a good crop.

Hop picking is completed and baling is in progress the crop is about average and the quality good. Beans, corn, and sugar beets are being harvested and yielding very satisfactory crops. The heavy grain crop in Southern California is rapidly going to warehouses or being shipped. The hay crop is all secured.

Prof. E. J. Wickson, in the Pacific Rural Press, speaking of the institute work in Southern California, says:

"Under the exceedingly satisfactory promotion of Prof. A. J. Cook, institute conductor for that part of the state, institute work has been carried on in increased measure during the last two years and has commanded increased popular approval. The organization of local farmers' clubs has focused interest and given opportunity for continuous effort for social and industrious advancement, while the annual Farmers' Club Institute, attended by delegations from local clubs and by the agricultural public generally, has proved to be a strong influence toward the enactment of several measures of wide value to the state."

News comes from England that the fruit crops on the continent are a failure. Foreign fruit is in great demand and shipments of bananas, pears, plums and grapes are very heavy. Prices have gone skyward, reaching from 50 to 100 per cent above the prices of last year. A good deal of hardship is also being felt by those who in former years, have found employment in picking and preserving the fruit crops of the country.

The oil industry in California which has been somewhat slack of late, is looking up, accordinfg to the Santa Paula Chronicle, because there is an increased demand for the product. Better transportation facilities, road improvement, refinery use and railroad equipment are creating a demand for oil, in all its forms, which is causing the price to look up.

Hot water and brushes are needed to clean the dairy separator properly. and they should be vigorously used.

Coast News and Notes

By R. A. Dague, 1130 Eddy St., San Francisco

Recently a meteor weighing a ton fell near Grant's Pass, Oregon.

San Rafael is arranging to hold a chrysanthemum fair in November.

Pomona Fruit Exchange shipped 406 cars of fruit and realized for the growers $110,000 this season.

California fruits are bringing good prices in the East. We are dominating the markets 3000 miles distant.

There is a probability that San Francisco will be chosen as the place for the next international yacht races.

California has 298,898 acres planted to alfalfa. In point of alfalfa acreage we are the second state in the Union.

The grape crop in Central California is coming on so rapidly that the carrying capacity of the railroads is seriously taxed.

Butter, eggs, flour, canned goods, meat and some other necessities have advanced in price in San Francisco the past ten days.

The United States Department of Agriculture is about to establish an experimental station at Ventura for the culture of flowers.

Bean cutting has commenced in Ventura county. The hot summer injured the crop—the damage being about 25 per cent. The output of limas will be about 100,000 sacks less than last year.

Lodi Sentinel: Outside buyers are offering better prices for wine grapes than the wineries, the report stating that $15 would be paid, and there is a possibility of the price going even higher than that.

Near Emigrant Gap black-leg is devastating the ranges. W. J. Sanford, a cattleman there has lost twenty-four head within a few days. Early vaccination is the only preventative of this destructive disease.

A great war of opposition to vaccination has broken out at San Diego. The anti-vaccinationists threaten to keep their children out of school and hire special teachers for them if vaccination is insisted upon.

Yuba City Farmer: The executive committee of the Sutter and Yuba Wool Growers' Asociation has decided to hold the fall wool sale this year from the Garrett Co's warehouse in Marysville on Saturday. Oct. 10.

A. C. Noe of Eureka and A. T. Crane of Santa Rosa have purchased the 3000 acre dairy ranch of Warboys & Reynolds. This land is situated near the mouths of the Sacramento and San Joaquin rivers and is composed of rich sediment from these two streams.

The Santa Clara County Fish and Game Protective Association's proposition to establish a thirty-acre deer park at Alum Rock is warmly indorsed by the park commissioners, and it is now an assured fact that the paddock will be built at an early day.

In Yolo half of the prune crop was shaken from the trees by a strong northwest wind which prevailed on the 11th inst. Raisins in process of drying were damaged slightly from dust, necessitating dipping. Many fruit and shade trees were blown down.

The beet sugar factory at Salinas has commenced operations. The run will last about 75 days. The tonnage will be only about one-third that of last year owing to the refusal of farmers in Pajaro Valley, Hollister and San Juan to raise beets at the prices offered.

There are about 90,000 sheep in Sacramento county. J. H. Glide is the largest individual owner. He brought most of the sires came from France. Forty-five came from Mexico. Mr. Glide says the great draw-back to the sheep industry in this State is scab. It is worse here than elsewhere.

The cannery at Visalia is busy at present.

The grape and almond harvest is in full blast in Sutter county.

The cattle disease still rages in Tuolumne and Calaveras counties and many cattle have died.

Barley is a good commodity to have just now. The price is tending upward as the demand increases.

The fruit growers in Humboldt county have lately organized. The county expects an output of 50,000 boxes of apples this season.

At Escondido the vineyardists and orchardists are greatly troubled over the multiplication of quails. They are doing a good deal of damage.

The Dr. Glenn estate, near Colusa, consisting of 100,000 acres, once noted as the largest wheat field in the world is being subdivided into 20 and 40 acre tracts and will be sold at from $40 to $65 per acre.

The assorting process of apples at the packing houses shows that fruit is very free from worms this season. Systematic summer spraying is responsible for such condition. —Pajaronian.

The quality of Pajaro apples this season will be first-class, but the size of the fruit will be hardly as large as that of last season. This is largely due perhaps to the lack of late spring rains and the prevailing dry summer which followed.

The Pomotropic says: A great diversity of opinion prevails in regard to the advisability of spraying and fumigating. This year in this section the popular method seems to be spraying and a number of outfits are being operated in the various orchards.

A few years ago California grape vines were planted in Smyrna by the Turks. Later the native vine was grafted into them. The result was an increased yield of fruit and a decrease of phylloxera. U. S. Consul R. W. Lane now estimates the coming crop of Sultanas at Smyrna at 49,000 tons.

The Santa Rosa Republican says: Earth worms are very humble, but earnest friends of the farmer; as fertilizers of the soil they are invaluable, continually turning over and loosening the earth, improving its mechanical condition and making it easy for the seeds to take root, and for the rain and moisture to penetrate.

The worst forest fire of the year is raging west of Grass Valley and has swept over miles of densely wooded country between Smartsville and Spencerville. In addition to heavy loss from valuable timber being destroyed, much pasturage and fences have been wiped out. In some cases cattlemen had hard work to save their herds, being compelled to drive them out of the burning zone to safety.

Pajaronian—Prof. W. T. Clarke says that the further he investigates the cause of the burning and dropping of leaves from apple trees in Pajaro Valley the more he becomes convinced that it is not altogether due to spraying with Paris green. Trees which have not been sprayed at all are in many cases similarly affected. The professor will investigate this question thoroughly.

Kern county has long been noted for its beef cattle. Dairying is becoming a most important industry, due in no little degree to the success with which alfalfa is grown. Here is what a report from Kern county says:

"This is ideal country for alfalfa, which yields six to eight crops a year, and which will grow continuously, without reseeding for fifteen years. It will maintain two cows to the acre. The climate is so mild that cattle can be kept out of doors all the time, and by breeding at the right season can be made to give plenty of milk at the time of year when butter is the highest."

A show of fat stock in San Francisco this winter is being talked up.

H. O. Woodworth, a graduate of Cornell University has been appointed foreman of the state poultry farm at Petaluma.

Bouldin Island near Stockton, contrains in one bed 3000 acres of asparagus. The crop annually makes about 325 carloads, valued at $600,000.

About 100,000 rainbow and brook trout were recently received by the California Fish Commission with which to stock the stream of Marin and Sonoma counties.

Managers of the California State Fair Live Stock Department are highly pleased at the creditable showing the dairy interest made. Next year they hope to se this interest materially increased.

The J. Steton Creamery is greatly extending its business. It now has a gasoline launch which runs as far down as Dutton's Island, three times a week. It carries about 40 gallons of milk each trip.

C. H. McGurk and D. S. Rosenbaum of Stockton, make a specialty of supplying the San Francisco market with fat cattle. They say there is plenty of stock cattle in the state, but good beef is scarce.

Walter Hine of Philadelphia was offered $60,000 for Lou Dillon, the famous Santa Rosa mare, that trots a mile in two minutes. C. K. Y. Billings her owner at this writing has not yet consented to sell the animal at the price offered.

Lawrence & Parkhurst are arranging to establish a tannery plant at Petaluma. They promise to turn out 400 sides of fine leather per week.

Fire last week destroyed Ellsworth Drying House at Niles. Fruit to the value of $10,000 and machinery valued at $5000 were consumed.

The directors of the California Grain Growers' Association held a meeting at Sacramento the 11th inst. President Pierce stated that members of the association are now receiving from $8 to $10 per ton more for grain than they had ever got before the association was organized.

The jute mill of the San Quentin prison is now turning out an average of 18,500 grain bags per day. There are about 800 convicts employed in the mill and they work eight hours per day. Sundays and holidays excepted. The increase in the output of bags for the past four years is about 3,000,000 more than any previous four years.

Prof. Hussman in charge of the Viticultural investigations for the United States last week made investigations with soil, climate, etc., in the vicinity of Stockton, with a view of locating an experimental government vineyard there. With him was Government Pathologist P. H. Doesett who is seeking a location for the establishment of a plant industry experimental station.

Experts from the Agricultural Department have for some time been making experiments in Fresno county, to reclaim the soil from alkali. A drainage district forty miles square is being formed, improvements to cost $260,000. The alkali salts were brought to the surface by copious irrigating. The tract experimented on was underlaid with tiles and then flooded so as to wash the alkali through the soil and thus drain it off.

Approximately half a million dollars worth of property was destroyed in the fire, says the Fruit Grower, which consumed one of the Southern Pacific Company's receiving sheds in San Francisco last week, together with 66 freight cars and their contents. It is known roughly that the shed that was entirely destroyed contained 60 bales of wool, 200 barrels of wine, 25 bales of hops, 790 cases of dried fruit, 300 cases of canned goods and five tons of miscellaneous frieght. The sixty-six cars that were burned contained for the most part hay, barley, wool, wine, dried fruit, canned goods, hops and other California products that had been delivered at the receiving shed during the day for shipment to eastern points.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

In a brief review I wish to mention the groups already gone over in reference to economy. The class Crustacea are neither harmful nor beneficial except that many like lobsters and shrimps are used for food. One order of the class Myriapod, the millipeds are all plant eaters, while the other order, centipeds are insectiverous and so are our friends. In the Cultivator of two weeks ago, the class Arachnida, or the spider class were referred to as exclusive friends. Had this been the order Spiders it would have been correct, but the class includes the order of mites and ticks, which, it will be remembered, are very serious enemies. They prey upon plants, upon culinary products and seriously worry our domestic animals while the ticks bear the germs of Texas fevers. We are now discussing the class Hexapoda or insects. We noted that the order Neuroptera or lace wings were all our friends except the one family, the white ants. In marked contrast to this is the order Orthoptera, all of which are injurious if we except the family, preying mantis. It will be remembered that the front wing of this order is very different from the hind wings, while in the lace wing order all four wings are much the same.

We still have to discuss in this order Orthoptera, the terribly destructive locusts, the less numerous katydids and the well-known crickets. All of these are to be numbered among the pests and all would be very destructive were they numerous. As is well-known, the locusts often come in overwhelming numbers and so are perhaps to be regarded as more pernicious than any other family of insects.

* * *

FAMILY ACRIDIDAE—The locusts or short horned grasshoppers are all placed in one family, Acididae. They are usually gray or brown and rarely green. They have long antennae, strong wings and mouthparts well fitted for biting. They often come upon the farmer in such devastating numbers that they have been regarded from the immemorable as one of the greatest of scourges. No country or clime is exempt from their ravages. We all remember the numerous immigrations of the Rocky Mountain locusts upon the States of the Middle West, where they rank with the chinch bug in the alarming damage, which comes from their invasions. Their color and short thick antennae will always serve to quickly identify them. Their food is very promiscuous and they are dreaded alike by orchardist gardener and general farmer. As they are biting insects they of course can be poisoned by Paris green, etc. Mixing bran, sugar and arsenic is often resorted to in battling these insects. The sugar and the bran attracts them, while the poison results in their taking off. A sort of huge, scraper like machine called Hopper-dozer is much used in Kansas, Nebraska, and Minnesota to collect and destroy the young, newly hatched locusts. It is drawn by horses and as the insects take wing they are crowded into a sort of hopper, which contains kerosene oil or crude petroleum, and thus they are destroyed in wagon loads.

FAMILY LOCUSTIDAE—The katydids are almost always green. They have very long threadlike antennae. They are best known by their song which is famous in rhyme and story. One poet speaks of "rasping the quiet of the night." The three syllables of the song give them their common name. The males produce the song as a love note to attract their mates. Many of them make a noise quite different. It is a long whirr and resembles not a little the rattle snake's rattle as also the song of the Cicada. The eggs of the katydid are quite large, are placed in two rows and overlap like the shingles of a roof. They quite resemble in form and appearance scale insects. I have often received them from orchardists, asking me what new scale had come upon them. The winged katydids are rarely numerous enough to seriously injure the husbandman. We have one here, which burrows in the ground and is known as the Jerusalem cricket or sand cricket. As it is a katydid of course it is no cricket at all. It sometimes burrows in potatoes and other tubers or bulbs and so does some damage though hardly enough to cause any unrest.

* * *

FAMILY GRYLLIDAE—The crickets have the long slim threadlike antennae of the katydid, but their thick wing covers bend down at the edge and their prominent ovipositor is in form of a bayonet rather than blade like. This latter form is that of the katydids The crickets are rarely very injurious, as they are not very common. The mole cricket of the East has the habits of the so-called sand cricket of California The beautiful white cricket often does considerable damage in laying its eggs, which are placed in cuts made in the branches of shrubs and trees. Thus we see that the eggs of these insects may be placed on trees, though locusts and most all crickets lay their eggs in the ground. The chirp of the cricket is as much a theme for the poet as is the song of the katydid

* * *

CLUB PICNICS.

The increasingly large and the increasingly interesting annual picnics of the Pomona and Claremont clubs prove conclusively that the picnic may be made an important adjunct in helping the clubs to a more gratifying success. The meeting at the Experiment Station of the 14th was noteworthy in the large number of eminent speakers. Mrs. Sherman's paper on the flower garden like all of her presentations chained the attention of all present. Few people men or women accomplish what Mrs. Sherman does yet she has time to attend clubs, to make her home beautifully attractive and in addition, to keep fully abreast the times in all that pertains to her study and work. I suggest that all of our clubs make more use of this picnic idea in the conduct of their meetings.

* * *

CARPET (BUFFOLO) BEETLES.

Mr. Aeneas McAndrew, Carpinteria, like a good many others in Southern California, is troubled with the carpet beetle. We found one of these in our own house the other day. The mischief is done by the grubs, which of course have six legs, are brownish in color, and thickly set with quite long hairs. The beetles are very small and nearly as broad as long. Mr. McA. says they are quite troublesome in the Ojai Valley. His house was built only one year ago with pine lumber. He asks if the insects can come from the lumber. They never do. They come in from the flowers out doors. He asks if in purchasing bisulphide of carbon, it is necessay to secure any special strength. Unless the bisulphide is adulterated, and I have never known of such a case, it is all right as purchased. I think a half teacupful of bisulphide would be enough for a room 12x14x9. I should, however, not use it in this way. In case of carpets and rugs I should take them up and give them a good beating, expecting thus to rid them of the pest. Clothing should be put into a close barrel or box, as I have often recommended. Then it will require much less of the liquid. An excess of the bisulphide will do no harm except adding to the expense. In case of upholstered furniture, it should be put in as close as room as possible and saturated with the liquid. In case it is thought best to use it in a room, it is only necessary to throw it in as it will very soon volatilize and do its deadly work.

* * *

GREEN MANURING.

Subscriber, Watsonville, wishes to know the most improved practice of fertilizing by means of legumes now in vogue in Southern California. As yet, I think, a very vigorous variety of peas is considered the best. They do not root as deeply as lupins, but we can always obtain the seed and they can be used for market or feeding if desired. They should be planted quite early. I think never later than September to always be sure of securing the best results. This often requires irrigation for the first few weeks. Some prefer broadcasting, while others plant in drills. In either case, if irrigation is required the furrows should be left at time of planting. They should be plowed under as early as February. If the season is cold and backward, they will not have attained their full growth by February if planted later than September. I have for the past ten years been recommending Canadian field peas because of their extreme vigor and prolificness.

* * *

SPOTTED FRUIT.

At the Upland Institute, as, also at the Experimental Station Picnic, much spotted fruit was exhibited. Much of this had been neither sprayed nor fumigated. It is said to be quite common in the orchard. The injury seems to be too deep for thrips, but I think results from some insect injury. I think our orchardists are observing their orchards, as never before and thus are observing such blemishes though they may be no more common than in previous years. It is to be hoped that much of the fruit will recover and that the balance will be too small in amount to appreciably affect the profits.

The resolution passed by the Covina Fruit Association, as also reports of some spotting by improper spraying, is causing some talk and uneasiness among our fruit growers. It has been proved beyond question that careful spraying, wisely done, with good distillate will not damage the fruit for market. With so many sprayers in the field, many of them without experience, and presumably not over cautious, these will undoubtedly be poor work done. I would as soon think of sending for a doctor of whom I knew nothing in case of sickness as to employ sprayers, who were not experienced and who had not won a reputation by good work. In any such particular work, the eye of the owner should always be upon it. I have repeatedly urged that the orchardist himself should be one of the spraying party, and were it my orchard, I should want to handle one of the nozzles. I expressed this idea at the San Dimas Institute whereupon several present said that they had rather trust to a contractor of good repute than to do it themselves. Mr. Corliss once said to that in all his spraying, either he or his boy must be present to supervise and see that it is properly done. Where so much is involved, we cannot be too cautious.

* * *

THE DAIRY AND ORCHARD.

It will be remembered that the Cultivator has agitated, not a little, in the past two or three years, the keeping of a dairy in connection with the orchard. It has been urged that the dairy would pay in itself and besides would furnish a very valuable fertilizer. There is no question, but that humus is one of the most important things to add to our soils to render them productive. Stable fertilizer and green manuring are the two ways of adding humus to our soil. The value of stable fertilizer is greatly increased in case nutritious food is fed and also depends largely upon the way it is handled. If the orchardist manufactures it himself he knows the method and can secure an excellent article. It will be remembered that Mr. Leffingwell of Whittier, has acted upon this suggestion and is more than pleased with the result. He speaks with almost as much enthusiasm of his Jersey dairy as he does of his splendid lemon grove.

I was much gratified last week at the Upland Institute to find that two or three gentlemen there were following in this same trend. One orchardist who has a dairy of several cows told me that his dairy, though he bought all the feed, paid fairly well, aside from the manure. I am glad these experiments are being tried. I cannot see how they can fail to furnish one of the most economical ways of fertilizing the orchard.

* * *

I was asked at this institute if there was any crop that could be grown in the orchard that would add to its fertility or at least that would not impoverish it and at the same time would furnish wholesome food for the dairy cattle. I answered that peas in connection with oats would furnish a balanced ration and by putting them into the silo we could secure a succulent food, which Mrs. Sherman says adds one-third to the butter products. After cutting the peas and oats for silage we still would have a large amount of root growth, which would add not a little to the fertility of the orchard. Mrs. Sherman suggested further that all weeds and green stuff about the roads be cut and put into the silo. She said this was relished greatly by the cattle and added not a little to the profit. Is it not more than possible that with an orchard of from five to eight acres, and a dairy with as many first-class cows, any person might have a property that would give him immense satisfaction and a generous livelihood. An orchard and dairy of this size would not need to be burdensome and at the same time would combine the best economy with maximum profits.

* * *

POLLINATION.

The lectures of Prof. C. F. Baker at the late institutes on pollination and circulation of sap were greatly appreciated. Prof. Baker has the happy faculty of being able to make science perfectly clear to all and at the same time captivating the attention of all hearers. He proved conclusively the importance of mixing varieties in planting all kinds of fruit. Cross fertilization is absolutely necessary in many cases. To secure this the varieties must not only be different, but must blossom at the same time and there must also be abundance of bees in close proximity to the orchard. It was also very helpful to all present to understand the exact method of sap circulation. These lectures will certainly help all who heard them to better methods of orchard culture.

* * *

INSTITUTES.

The last two of the September Institutes, San Dimas and Upland, were no whit behind the others in attendance and interest. In attendance, decoration of hall and music the Upland institute stood well to the front. It was very delightful to note the great throng and the continued interest of all present at the Upland Institute. It was gratifying to observe the loyalty of those present at both these institutes to the Southern California Fruit Exchange. These sections stand well at the head in the excellent care, which they give to their orchards as well as the excellent fruit which they send to the markets. The people have generally been in the exchange and if we may judge from the enthusiasm shown at every reference to this organization, we may well believe that those who have remained outside are now regretful.

The fruit growers of Santa Clara county anticipate considerable trouble over the enforcement of the bill passed by the last Legislature, which requires that all packed fruit must bear a label, showing where it was grown and packed. The packers insist that they cannot take fruit from different sections and make separate labels. Complaints have been sent to the Governor from Pajaro Valley that packers are violating the law. The law provides for a fine of from $200 to $500 for its violation. Governor Pardee has appointed A. N. Judd of Watsonville inspector and instructed him to investigate the matter.

California Horticulturally

JOHN ISAAC, SACRAMENTO

DIABROTICA AND LADY BUGS.

It is a little surprising, in view of all that has been written and said about the lady bug family and its beneficial work, to find how many farmers and fruit growers there are who are totally ignorant of both. We frequently meet people who recognize but one thing as a lady-bug, and that one the Diabrotica, which is not a lady-bug and does not look like or act like one. A few days since we were assured by a fruit grower in one of the northern counties who ought to have known better, that a very great mistake had been made in importing the lady-bug into California, for it had developed into one of the most destructive of our pests. Askin for a descriptionof this lady-bug we were told that it was a little green bug, with black stripes and that it destroyed the blossoms of cucumber, melon and squash vines. Now, in spite of all that has been published about these pests the narrator did not know a Diabrotica from a lady-bug when he saw it, but having heard of the importation of the Vedalia cardinalis, all insects became lady-bugs, and imported ones at that, to him. There is no resemblance between the diabrotica and the lady-bug. The former is a long rakish looking fellow, with a yellowish-green black, he has a distinct neck with long antennae, or feelers. The lady-bugs are nearly hemispherical, their heads so close to their body that no neck is visible and the feelers are so short that it requires close inspection to notice them at all. The Diabrotica are pests in every stage of their existance and should be destroyed on sight, while the lady bugs are always beneficial and should always be preserved. It is unfortunate that our friends and enemies should be thus confounded, as the former often falls victims for the deeds of the latter.

* * *

CULTIVATING TOWN LOTS.

It would be a good thing if there were some man in every town and valley who would make a business of planting small garden patches and vacant lots, and for him to let it be known that he was prepared for that work. An eyesore in nearly every town in this state are the number of bare uncultivated patches one sees left, summer after summer, and the objection to cultivating them is the difficulty of finding anyone to plant and prepare them. The owner of a quarter of an acre patch cannot afford to keep a team and plow to put it in shape, and often has neither the time nor inclination to look up some one to do it, while if it were known that some one was within reach who would do that class of work he would willingly pay out a few dollars to have it put in shape, and the man who would do it could make better pay than he could on a larger job. Here is a hint for some enterprising man in each town, let him put a small ad in the local paper that he is prepared to plant small patches at reasonable rates and he will get all the work he wants.

* * *

WORK FOR THE SPRAY PUMP.

Every orchardist, every farmer and every person who keeps stock or poultry should have a spray pump. The man who has fruit trees, especially, no matter how small the number, should be prepared to protect them from the attacks of insect pests and fungus diseases. There is no excuse for not caring for them. Sometimes the owner does not value the product of a few trees, and on this account will neglect them, and leave them to become a breeding ground for pests to affect his more careful neighbor. It is these small, neglected orchards that are a detriment in a fruit growing section. Not being profitable they are neglected, and the owners, having other business, or being absent, do not consider them worthy of attention, and they are left to infect the whole section, in spite of the best efforts of the careful grower. Orchards that are not valued should be uprooted; and trees that are left should be sprayed and kept clean. Now is the time that those who have not already got spraying outfits should get them. Winter will soon be with us again, deciduous trees will be dormant, and the pruning season will soon follow. Then the spray pump should be brought into active service. The advantages of winter spraying are many. The trees being denuded of their foliage are more easily reached in every part. The spraying compounds can be used of much greater strength than at any other time, and strong compounds can then be used that would seriously injure the tree when they are out in leaf, and preventive remedies are always more effective than curative. For curl leaf, of the peach, shot-hole fungus, aple scab and other fungus diseases, the work to be effective must be preventive, for if not done before the disease manifests itself, it becomes almost useless, a waste of time and materials. The best work against the armored scale is done during the dormancy of the trees with the salt, sulphur and lime compound. So the owner of a tree owes it to himself, and more to his neighbors, to own a spray pump and to use it, and if he has not got one it is now a good time to prepare for the winter's campaign against the pests, and secure one.

* * *

COMPERE OFF ON ANOTHER MISSION.

We note that the Minister of Lands for Western Australia, whose position is somewhat similar to that of our Secretary of Agriculture, has decided to send George Compere, now the Entomologist for the Department of Agriculture for that state, to India and the Malay archipelego in search for the parasite of the fruit fly, which is playing such havoc with the orchards of Western Australia. Mr. Compere quite recently returned from a trip to the Mediterranean countries, where it was hoped that he would find the natural enemies of the fruit fly, but while pursuing his investigations there he discovered that the fly had been introduced from some other point and that a search for an effective parasite there was useless. The Western Australian government has an abiding faith in the parasitic theory and is keeping Mr. Compere steadily at work searching out the natural enemies of its worst insect pest.

* * *

CODLIN MOTH CHECKS.

Speaking of parasites, it is well known that there are several enemies to the codlin moth, both predaceous and parasitic, in this country, and notably some of the Ichneumon flies, but none of these have as yet been able to keep pace with the pest, probably because they in turn are parasitised, or kept in check by secondary parasites, which prevent them from multiplying in sufficient numbers to cope with the moth. It is sincerely to be hoped that an efficient parasite may yet be discovered and introduced without its checks in order to overtake and keep down this one most serious of all our fruit pests. The codlin moth is a stranger here, probably introduced from Europe, and there, while known as far back as history goes, it is not a serious pest. Why we have not yet endeavored to discover.

* * *

NORTHERN ORANGES RIPENING.

The recent hot weather in Northern California has caused the oranges to color rapidly and shipments from the sections around Oroville will soon commence. The fruit is not yet in condition for market but another month of hot weather will put it in good shape, and the great bulk of the crop will be gone by Thanksgiving. The season is somewhat earlier than usual this year and it is probable that the whole crop of Northern California will be out of the way before the Southern fruit is ready for market. It is a surprise to most people that oranges so far north should ripen so much earlier than those in the south, but one of the pleasantest features of Southern California is responsible for this, and that is the cool nights of the summer months. The growing and ripening processes in the fruit, which are forced during the warm days, are checked by the cool nights and the fruit is therefore longer in attaining maturity than in the interior valleys of the north, where there is less difference in the relative temperature of day and night. The orange sections of the northern counties are usually in the foothills of the Sierra Nevada range, far back from the ocean, with the coast range shutting off the cool breezes from the sea. The soil becomes thoroughly heated during the day and the radiation during the night is slow. As a result of these conditions, citrus fruit there ripens earlier than where cool nights are the rule and growing is checked.

The total amount of fruit shipped this year from Sacramento to date is 5147 cars as compared with 5064 shipped at same date last year.

The almond harvest is now in progress in San Joaquin county. The orchards that were irrigated and cultivated yield much larger. On non-irrigated lands the crop is poor.

Hop growers at Sacramento have been offered 22½ cents for hops. They are holding out for 25 cents. They feel justified in doing this on account of a poor hop crop in Oregon.

Scott's Wax A SURE CURE FOR **Gum Disease**

Made after the formula of Mr. John Scott, late Horticultural Commissioner, by

S. M. WOODBRIDGE, Ph. D., So. Pasadena, Cal.

DIRECTIONS—Cut away the diseased parts of the tree, allow to dry, and apply melted wax with a brush.

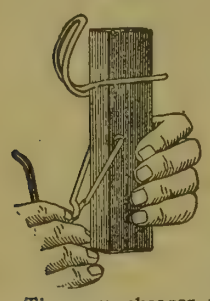
Be Sure and Get



Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

ORANGES

(Continued from first page)

any better time to grow the crops than to plant them in the early fall and plow them under during the winter. There is one conflicting element in this plant and that is, commerthis plant and that is commerccial fertilizers should be applied to the green manuring crop so that it will make a beter growth and also act as a catch crop. This would necessitate planting such crops at the time in which the commercial fertilizers should be applied.

* * *

Gathering and Marketing—The gathering and marketing of the crop are problems that are well worked out and little can be added by us. There are a few points however that are always in order. A prominent and successful grower says that after good fruit is grown, success lies in careful handling. Oranges that are carelessly cut and boxed in the orchard will never carry as well as those handled with care. Oranges that are left in the picking boxes too long before shipping will show up more defects at packing time than those packed fresh from the trees. There are two sides to this part of the question. Shall we ship the fruit before these defects are apparent, or shall we allow the fruit to stand in the packing house a few days and ship only that which promises to ship well? Considered from a business stand point, it appears to us that the latter is the proper thing to do.

ROOTING GRAPE CUTTINGS.

Editor Cultivator:- I am preparing to plant a vineyard and would like to have a few suggestions about rooting cuttings. When should they be taken from the vines and how long should they be made? How deep should they be planted and what treatment should they receive before planting?—Grower Ontario. We have the best success in rooting grape cuttings by taking them off the vines and putting them directly in the nursery rows. We cut our brush about one foot long and leave a bud within an inch of the top. If the canes are open, that is, have a large soft pith, we do not use them. Some varieties are more inclined to be that way than others. If it is desired to use such cuttings, cut the upper ends close to the bud so that no cavity will show. Cuttings with open pith cavities are soft and if a prolonged wet spell prevails, there is danger of their rotting when left so as to hold water. Plant the cuttings that are made in the morning, in the nursery in the afternoon. If this is not convenient, cover them with a wet sack or damp earth until you can plant them. Make your nursery rows four feet apart and plant the cuttings five inches apart in the rows. Stand them straight on end. There is no use putting them in at a slant of 15 or 20 degrees from the perpendicular. It makes hoeing and cultivating close to the plants difficult and does not make a well shaped vine. If you wish to plant in the side of a plow furrow, throw back part of the soil after the furrow is made and stick the cuttings in the soft dirt next to the bank made by the landside or the plow, and have the cuttings perpendicular when they are planted. Leave the top of the cuttings about three inches above the ground. This will bring all of the other buds below the surface. Very often the top bud will not start, but the next below will be just beneath the surface of the ground and in a position to make a good top. With most varieties, there need be no attention given to the point at which the cut at the bottom of the cane is made, as the roots will be thrown out wherever the cut is made. With grapes of the American type and commonly called "Eastern" grapes, the cut should be made through the node or point at which the bud is situated. The cambium layer is much thicker there than at any point. The rootlets start from that layer and most varieties of "Eastern" grapes are slow to start, very often they will fail to form rots when cut between the buds.

A mistake is often made in irrigating grape vines in the nursery, by not allowing the water to run long enough. In our sandy soil, water seeps away rapidly and the roots of grape vines penetrate very deep. It is at the ends of roots that most of the water is taken in, and it must be allowed to reach a depth of at least two feet when irrigating, three feet is better.

If cuttings are to be planted in vineyard form, they should be planted at least 18 inches or 2 feet deep. It is expensive to irrigate cuttings in vineyard form and it is quite frequent that it cannot be done. In such cases the land should be kept well cultivated during the whole season preceding the planting so that no moisture will be lost through the growth of weeds or the making of the surface. Cuttings planted in vineyard form should be put in holes made with a bar, and the dirt settled around them with water. This can be cheaply done with a tank on a wagon with a hose attached.

EUCALYPTUS FAILURES.

Editor Cultivator: I wish you would tell me why I failed with my eucalyptus trees. A year ago last spring, I planted 10 acres to Blue Gums in sandy soil that was wet enough to ball in the hand and the trees were kept wet up to the time of planting. They were raised in the shade and were about 18 inches tall when transplanted from the boxes. I did not shade them and what did not die outright were gnawed off by the rabbits; out of the whole planting I did not get one dozen to grow. This year I planted them out just the same, kept them well watered until transplanted, but used 8 inch trees and enclosed them with Yucca wrappers. As a result, I did not get a single tree to grow. I am discouraged and do not know what way to go at it. Can I raise my own trees and if so, where can I get the seed? Any information along this line will be gratefully received. M. A. G., Pomona.

We suspect that you kept your trees too wet before transplanting them. The boxes containing the seedling should be given but little direct sunlight at first. They should be placed where they will get partial shade at first and gradualy work them into the full sunshine. This can be done by fixing up a cover of old sacks or light cloth. Leave it off at nights and for awhile after sunrise at first. Increase the length of time in which they are in the sun, from day to day. At the end of a week they will not require any cover during the day at all when they may be transplanted into the field without risk on that score. Mr. William Shutt of the Santa Monica Forestry Station has made an unqualified success of growing and transplanting eucalyptus trees and we can do no better than give his methods. When he wishes to grow Blue Gums, he gathers the pods from trees that are being cut down for wood in the neighborhood and places them on paper or in a box in the sun. After a few days they will open and the seed can be separated from the pods by jolting them in a seive. A quantity of red chaff will come from the pods with the seed which is black and resembles onion seed. This can be separated from the seed by the use of a fine seive that will allow the chaff to pass through. In order to raise an 8-inch tree to be planted in the latter part of March, the seed should be planted about the first or second week in September. Mr. Shutt finds that coal oil cases make the most convenient boxes. He cuts them in three pieces lengthwise, this making them about the proper depth. These are filled with good soil so that they will be almost full after the soil has been well firmed. These boxes contain about 100 trees when they are properly spaced. Half inch board is cut to fit loosely inside of the box and is marked so as to contain 100 squares. At the corner of each square a half-inch hole is bored. The board is placed in the box after the soil has been well pressed down and a few seeds dropped in each hole. The board is removed and a light covering of sand is placed on top. The trees do not require transplanting in boxes in order to get a certain number there, or to have them in convenient shape to cut out at transplanting time. If more than one seed grows at a place, they can be thinned to one and if desirable, those removed may be planted in other boxes. Some growers wish to plant in seed beds in the open ground. If this is done, a board floor should be planted about three inches deep first, to prevent the tap roots from striking down which will make transplanting difficult and risky. When planting times comes, the soil in the boxes or seed bed should be allowed to dry out so that the trees show a slight lack of moisture. This is done to make the flow of moisture after transplanting, go into the soil surrounding the roots of the Gum trees. If the ground is more moist than the soil in which the small trees grow, the soil water will leave it, and carry the plant food with it to the trees. If the reverse is true, the moisture in the soil containing the roots of the young seedlings will be drawn out into the surrounding ground. This robs the young plant at the critical time, of its only support. Your chief cause of failure must have come from keeping your seedlings in the box too wet. Your last failure was due mostly to the same cause as your first, but made more sure by smothering them with the tree Yuccas. If you try Mr. Shutt's plan of having them as dry as possible before planting and leave off the Yucca wrappers, we see no reason why you should not succeed. You took too many of the wrong kinds of precautions.

CONQUERING THE ALKALI.

The announcement comes that Prof. W. H. Hellman, a government expert in charge of an experiment station on the alkali flats "over Jordan" in Salt Lake has made the important discovery of some process by which the alkali can be effectively removed from the soil and the land made arable. If this is true, Prof. Hellman has done a work for which he shall be called blessed, for it will restore to use vast areas of the finest land in the west, for there is no better land than alkali land when there's no alkali in it. So far Prof. Hellman has not made his process known, but he looks wise and the process may be published by the government later on. If this is true, it will be a more invaluable aid for the owner of alkali lands than was the salt bush introduced by our own university some years since.

The run on fruit at the Sutter Preserving Co.'s. cannery is about over with, but there will be a large pack made of string beans and tomatoes for the next month or two. A large force of hands are employed and more are wanted. The beans and tomatoes are grown in this vicinity and are of choice quality.—Sutter County Farmer.

It is estimated that the Anderson orchards near Redding will this year produce 1500 tons of dried prunes, at 2½ cents, bringing the crop to about $75,000.

VETERINARY DEPARTMENT

Address all communications to DR. H. D. FENIMORE, Veterinary Surgeon, 642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

COUGH.

Editor Cultivator I have a cow which has a deep cough. She has been sucking a calf since August first. Has good appetite and gives a good quantity of milk. She shows no sign of pain. Can you give cause and a remedy.—C. G.

Test with tuberculine for tuberculosis.

* * *

HEAVES.

Editor Cultivator: I write to ask you if there is any remedy you can advise for heaves in a horse. The mare I have is not over 9 years old and well worth $75 if she were well. If there is anything you know of advise me, and will gladly reward you.—B. A. M.

When a horse really has heaves or emphysema he cannot be cured. This condition is a breaking down of the minute air cells or the lungs, so that instead of having thousands of minute air cells there are large bubbles similar to a hog's bladder blown up. The lung has lost its power to expel all the bad air, consequently cannot inhale enough fresh air. The disease is relieved by giving one ounce daily of Fowler's solution of arsenic.

* * *

RETENTION OF MILK.

Editor Cultivator: I have a fresh milk cow that refuses to let down her milk. Her udder seems hard and swollen, and I think has large quantities of milk. Can you tell me through the columns of your paper any way to compel her to let down her milk.—F. T. W.

There is a sphinctor muscle at the top of the teat that closes an opening at the top of the teat similar to the sphinctor muscle at the bottom, closing the opening at the bottom of the teat. When a cow is excessively nervous from fright or other cause this upper muscle becomes contracted, and it is said the cow don't give down her milk. This upper opening may also become closed from inflammatory swelling of the mucous membrane lining the teat.

* * *

DILATED WITHERS.

Editor Cultivator: The withers of two of my riding horses seem in bad condition There is an almost imperceptible swelling there, but when they are ridden for two or three hours and galloped the withers become much inflamed, usually on one side. Swelling gradually goes down in about seven or eight hours: This trouble with the withers I know is the result of Indians riding the horses without currying horses backs, not putting enough blankets on and galloping over rough country Horses stand it for three or four years, now are knocked out They are strong, finely built Morgan horses, splendid for work or under a saddle except for this difficulty Will a long rest cure them? How long? What is your opinion?—A. L. Utt.

There is a bursa on each side of the top of the dorsal vertebrae at the withers which assists the gliding of the neutral ligament that goes from the withers to the top of the head. When these bursae are injured or bruised they swell up similar to the puffs at the fetlock called wind galls. An application of cantharides blister over the enlargements at the withers once a month for three months and rest during that time usually brings about a cure.

* * *

MYCOTIC INTOXICATION.

Editor Cultivator: I have one sow and six pigs that I wish you would please tell me what is the matter with them. The pigs have been weaned a little over one month, they stagger around as if they were drunk. Now the sow is affected the same way. I feed them one quart of molasses in a bucketful of water night and morning, also soaked barley, stock beets and green alfalfa, all they will eat. They seem to be hungry all the time. They have shady, clean pens, and are in fairly good condition. Please answer through the Cultivator and oblige.—Subscriber.

There is a fungus or other poisonous product in the feed or what they get access too, that is effecting the nervous system, causing the paresis.

BEE SUPPLIES—G. G. Wickson & Co, 123 N. Main Street, Los Angeles, Cal.

AN IMPORTANT RECOMMENDATION.

At the present time the Scutellista Cyanea, the parasite for the black scale is attracting the attention of all citrus fruit growers. The question which many of those fruit growers are considering, is whether they shall fumigate or spray their orchards now or wait for this parasite to be introduced and let it do the work of destroying the scales.

The length of time required for the Scutellista to clean an orchard from black scale will depend upon the amount of scale in the orchard at the time of the introduction of the parasite, for if two colonies of the Scutellista equal in numbers are released, the one in an orchard heavily stocked with scale, and the other one in an orchard with but few scale, it is evident that with the same rate of increase in both colonies the one placed in the orchard with but a light stock of scale, will clean it up much sooner than the orchard badly infested. The orchardist who does not fumigate or spray his orchard this year because he anticipates placing a colony of Scutellista in the orchard next summer will have the following results.

The crop of young scale now hatched will injure the next year's crop of fruit. The colony placed in the orchard next summer will have no perceptible effect upon the quantity of scale infesting the orchard, and the orchard left without cleaning for a second year will be stocked to its fullest capacity with scale. The second year after the parasite has been located, it will under the condition of the scale then existing in the orchard, probably destroy from 50 to 75 per cent. of the scale, leaving a good stock of scale to go over to the third year, when it is to be hoped the fly will be numerous enough to practically clean the orchard. One thing should be remembered, the adult fly does not feed on the young scale, it only attacks the matured scale by depositing an egg under the shell from which hatches the larvae of the parasite, and this larvae feeds on the egg and larvae of the scale under which it is established. All the larvae of the scale which get out from under the shell are immune from the attacks of the parasite until they have arrived at maity. From this, it will be seen that the parasite does not destroy the individual scale until it has arrived at maturity, and therefore not until the scale has drawn its life's support from the tree and fruit.

Thoroughly clean the orchard this year, then locate a colony of the Scutellista next summer and the parasite will under these conditions, quickly clean the orchard, and the trees and fruit will suffer but little or no injury from the scale. The colony of Scutellista located on Marengo avenue, Pasadena, has been very successful. The colony was placed there the last of August, 1902, and this is its second year of work. There is still a fair stock of young scale on the pepper trees to go over to next year. I am confident that the fly will practically clean the trees next summer.

For the year of introduction the fly made but little showing. This year an inspection on July 1st, the parasite was found attacking the scale on 12 pepper trees; July 18th, 18 trees; August 1st, 48 trees; September 1st 225 pepper trees; and on fruit and ornamental trees covering about 75 acres. My reason for believing this parasite will effectually clean these trees next year is that an inspection the first of August of the trees near where the colony was established showed 90 per cent. of the scale then in condition to be parasited, to have been attacked by the parasite. But it must be remembered that at that date nearly 50 per cent. of the scale had hatched out before the fly had became numerous enough to be effective Less than 5 per cent. of the scale on the pepper trees on which the parasites have last located have been parasited, for the reason that the bulk of the scale had hatched out before the flies became numerous enough to cover the whole area now occupied by them. It should be stated in this connection, that about 700 colonies distributed through the Horticultural Commission of Los Angeles county were drawn from this source, but not to any amount until after the first of August.

All applications for colonies of the Scutellista for Los Angeles county should be addressed to J. W. Jeffrey, Secretary of the Horticultural Commission of Los Angeles county.

GO TO GARDENA

Do you want a bargain? Do you want to make money and live in a beautiful farming district near street-car lines, 30 minutes from Los Angeles? Then "Go to Gardena," where there is taken an abundance of water from deep wells, ranging from 200 to 260 feet deep, and furnishing from 40 to 150 inches of water (per well) pouring forth an inexhaustible supply of pure soft water, both for irrigating and domestic use.

The soil is rich sandy loam, laying level and well adapted for irrigation. It produces the finest quality of alfalfa, berries and vegetables. The climate is ideal. There is a good class of people, churches, schools, etc.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 3 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

GRAY & NELSON
Gardena, Cal.

C. H. SESSIONS, Associate Editor

DAIRYING IN CALIFORNIA.

The Cultivator has for some time past urged the fact that California ought to be one of the most successful dairy states in the Union. Its climate, so well adapted to the finer breeds of milk cows, its vast ranges for grazing purposes and especially its undeveloped territory in the northern part of the state, should attract the attention of dairymen the country over, who seek a territory where conditions favor the development of dairying on a broad and comprehensive scale. Along this line the San Francisco Chronicle very timely discusses the subject and offers some pertinent suggestions which deserve more than a passing notice. Special reference is made to coast counties, in the article, but above San Francisco, and in territory contiguous, the same conditions obtain as prevail near the city, especially so far as feed and water are concerned. The Chronicle says:

"One of the important although half developed industries of California is dairying, for which the coast counties north of San Francisco are eminently adapted. For many years these counties, with the addition of the coast market for agricultural produce. The cost of crossing the coast range with railroads has thus far prevented that easy access which has made other sections of California so well known. While lumbering was confined to the district immediately adjacent to the sea and Eastern prices for lumber would not warrant rail transportation to those markets it was impossible to enlist capital to build railroads over the Coast range. All this has changed, and Eureka will soon be as accessible as San Jose. In the meantime any who are exploring California will be well paid for the trouble of a trip north by sea. It is a country with growth in it.

FINE SHORTHORNS FINELY CATALOGUED.

Dealers in farm machinery and nursery stock have always had a faculty of putting on beautifully printed catalogues and price lists which have proved business bringers and been a source of much profit.

The live-stock people of California have not as a rule yet reached up to this method of reaching for new business. This makes the pleasure all the greater when such a catalogue is seen as is put out by the estate of William H. Howard of San Francisco. This is the catalogue of the Quinto Herd of Shorthorns. It is a pamphlet of twenty-four pages in cover printed on coated book filled with half-toned pictures of Shorthorn stock and Quinto Ranch scenes. The text is descriptive of the stock of that ranch together

Royal Fashion, 191757, 1st Premium 2-Year-Old Bull, State Class. Property of Wm. H. Howard Estate, San Francisco.

districts of San Mateo and Santa Cruz, had almost a monopoly of the butter and cheese making of this state, and although in recent years the introduction of modern appliances, the use of the silo and the extension of the manufacture of ice have enabled the interior alfalfa-growing counties to make great strides in this industry, the northern coast, and especially Humboldt county, remains the great natural dairy district of the state. All that can be done in the interior can also be done in Humboldt county, and there is the addition of the natural advantages arising from an earlier, later and larger rainfall with which to produce feed. Dairying in Humboldt county differs from dairying in the interior by reason of the possibility of greater reliance on nature to produce feed. The ranges start earlier and last longer, and in some sections the turf-producing grasses will thrive and give permanent meadow. Irrigation is as possible there as elsewhere.

These reasons have enabled Humboldt county to retain its pre-eminence as a butter-producing district, and dairying is the chief agricultural industry of the county. The abundant rains on the northern coast unfit the section for fruit and other more speculative agricultural industries and have compelled its people, possibly against their wish, but certainly very much to their advantage, to adhere closely to the staple agricultural industries which do not appeal strongly to the imagination but contribute with far more certainty than others to the pocket and which are the foundation of prosperous agriculture the world over. The northern coast is a country well timbered, well watered and well adapted to all forage plants. The sea assures cheap transportation forever, and the large lumber interests provide a steady and profitable home with pedigrees and other valuable information.

This herd is headed by the famous bull King Spicy 129279. His get with the two junior herd bulls, Royal Fashion 191757 and Chief of Valley View IV, 182500, were awarded forty-five premiums at the vaarious classes at State Fair season 1903, making practically a clean sweep in the state classes and also more than dividing the honors in the open class. We think it worthy of especial notice of breeders that the herd was awarded both first and second premiums in both the open and state classes for the best breeders young herd under two years old. This certainly bears out the statement which appears in the first page of their catalouge that they breed their show cattle and show their breeding cattle. Further evidence of the merits of their herd as producer of young stock of the first quality may be obtained by a perusal of the official list of cattle awards of the California State Fair season of 1903, published last week in the Cultivator.

The office of the growers of this herd is at 206 Sansome street, San Francisco. The ranch is on Quinto Creek, Merced county, with M. L. Hunt, superintendent in charge.

WHAT IS THE BEST BREED OF CATTLE FOR NORTHERN CALIFORNIA.

Notwithstanding the fact that the editor of this paper is engaged in breeding the type of beef cattle known as Herefords, he does not believe that other breeds may not contain highly profitable cattle. The famous Shorthorn has for many years been regarded as having universal merit. But of late the Aberdeen Angus cattle have attracted wide attention and it is to this breed we desire to call attention in this writing. The most successful raiser of this class of cattle in the West is W. A. McHenry, of Iowa, and R. E. Candor of North Dakota. These gentlemen vie with the breeders of Herefords and contend that the Aberdeen Angus is as good a strain of cattle for cool and wet countries as the Hereford is.

Mr. Candor, in a letter to the Farmer discusses the shorthorn merits with much intelligence, and among other points in its favor, makes the following:

"It is primarily a beef breed yet there are many good milk cows among them. Any cow in my herd will raise two calves, and do it right. We are willing to base our pure-bred values upon the high esteem in which the breed is held on the Chicago market. At the international exposition of 1901 the Angus furnished the grand champion steer and another one to spare. Not only this but Angus grades won three-fourths of the prizes throughout the fat cattle classifications of this show, where the breeds competed, including the grand champion car load that sold for $150. The breed that can present such specimens of the finished product and show such wonderfully easy feeding and early maturing certainly deserves the careful consideration of those interested in stock breeding. They are a solid black in color, above the underline, and have no horns. They will attract attention, and their evenness, in a bunch, will sell them over perhaps equally as good individuals of mixed colors with horns. Cold, damp weather effects them as little as any cattle on earth and they are the best of rustlers. A properly bred Abredeen Angus bull crossed upon native cows will result in about eighty-five per cent of the calves coming black and polled, without horns. One cross of this breeding changes the crop of calves from a lot of mixed colors and horns to practically one color and no horns. Surely there can be no question but this is a desirable improvement Not only this but the calves will have a tendency to the early maturing properties that has brought this breed so rapidly to the front on our prairies. This cross in a herd of high grade Shorthorn cows will produce calves that need but one trial to bring enthusiastic converts to cross-breeding, bringing out, as it does, some of the best qualities of both breeds. This is past the experimental stage. We have them right here among you and my own correspondence assures me that many are waking up to the fact that scrub cattle in North Dakota pay only a fraction of the profit the better bred beef cattle do. If we breed cattle for the money there is in it then the best is what we want. We want them even, early maturing, good rustlers and without horns. This is exactly what Aberdeen Angus cattle are when either pure or high grade."

WHY MILK VARIES IN TEST.

Prof. J. A. Conover of the Kansas Station, writes of milk tests as follows in Farm and Home.

At nearly every institue attended by Prof. Cottrell and myself, the question was asked: 'What is the reason our milk tests 2.6 per cent one month and next, under exactly the same conditions, it tests 4 per cent or more?' There are a great many things that affect the test, so that we cannot point to any one thing as doing it. In the first place, the conditions are never "exactly" the same; the pasture may be better one month than another, the weather may be cooler or warmer, perhaps you encourage the cow less with the milk stool, or perhaps the boy who brings them in does not get them so much excited. All these things, and many more, influence the per cent of butter fat."

Kindness is sure to be rewarded by an increase in both the per cent of butter fat and also in the milk yield; whenever you abuse the cow, either by a sharp word, the milk stool, or by running her, you are taking money out of your pocket by decreasing the per cent of butter fat, and also the yield of milk. Whenever the cow suffers for lack of food, water or lack of proper care, there is a decrease in the amount received from her.

There are other reasons why your test may be lower one month than another. When the milk is warm, it churns very easily, so that when you send your milk to the station in cans only half full, they will be partially churned when they get there. There is no way of getting a fair sample of such milk, for the butter fat that is churned is lost both to the patron and to the creamery. If you have a can and a half to send, fill one can full, so that you will be sure to have that much that will not be churned. Keep the milk as cool as possible, as it does not churn so readily at a low temperature

If you do not want low tests, do not take the first milk yourself and let the calf have the last. The first milk often tests as low as one-half of one per cent, while the last will test from ten to twelve per cent. Don't skim all your milk before you send it to the station, and then expect it to test six per cent.

To the creamery man I would say, keep all the samples of milk from churning, if possible; good tests can never be obtained from a churned sample without the use of ether, and this is too laborious a process for you. It is claimed by some that simply heating the milk to a temperature that will melt butter fat will answer, but my work in this line convinces me that satisfactory results can never be obtained in this manner.

Hoard's Dairyman says "That the dairy idea has so long existed in the Willamette Valley, Oregon, and other dairy districts in that state, that the prevailing type of cattle there are Jersey grades. It is generally the case that where farmers become imbued with dairy ideas and strive to reach the best perfection and profit in their business they soon see that one of the most important aids to such results is a cow bred for dairy purposes."

The same idea exists in the dairy districts around San Francisco, and, we are glad to say, in Southern California, although not as general as should prevail. Dairymen must come to the conviction that only the best bred cow is the profitable one to keep.

The Fresno Republican of this week calls attention to the trouble Mr. Heiskell of that county has lately experienced in endeavoring to move a herd of 2500 cattle through Inyo county, Grove and Meadows and Crane Valley country. Somebody had circulated a report that his cattle were infected with anthrax, a contagious disease that the veterinarians and all cattle people have been discussing a great deal of late. So great is the fear among stockmen of this disease that over anxiety seems to have seized hold of them in this case for not a single head of Mr. Heiskel's cattle was affected by this disease.

Superior Judge Peter J. Shields, of Santa Rosa, in alluding to the fine show of cattle at the State Fair, some from Nevada, some from this state, says: "The animals, while an earnest of what California and Nevada can do in producing fine catle, are but a hint of what may be done. The breed of cattle that will eventually take first rank in California will be the milk and butter producers. The dairying possibilities have scarcely been realized. Humboldt county has grown rich out of its dairies. Counties in the interior are just awakening to the great possibilities offered. California butter production should be doubled and ere long will be."

Some dairymen think if they do not get a good price for their milk at the creamery that the fault lies with the creamery; they should remember that the patron produces the butter—the creamery only separates it. Patrons should not forget that the interests of the creamery and their own are the same

---

A Dakota dairy bulletin says: "The per cent of butter fat is governed by the breed and not by the feed."

JERSEY FOR SALE

A FINE BULL CALF

Seven months old, cut of Rhyme, Nr. 125266, and sired by Golden of Biltmore. No. 73713. For price and pedigree address

Nothing Succeeds Like Success

You Will Have Success if You Feed Your Hens Coulson's Egg and Feather Food

Coulson's Egg Food has been fed with success for over a year by many of the oldest and largest owners of poultry ranches in the State of California.

Geo. Gaston, who has about 2500 laying hens, feeds over 50 sacks a month of this feed.

Mark Hardin, who has about 3000 head of poultry, takes out four-horse wagon load every couple of weeks. Mr. Hardin says that the hens do much better on this feed than when fed on middlings, etc.; that when they are fed on Coulson's food they look well and are lively and spry and lay more.

P. Jensen, who has several thousand hens, feeds from forty to fifty sacks a month of this feed.

Walter Church, who has nearly 3000 hens, has been feeding Coulson's Egg Food for about a year, hauling it out by the four-horse wagon load; also C. C. Boysen, who has about 3000 hens.

These men are successful poultrymen, who have been raising poultry for the past ten years and longer and they know the value of good feed and proper feed for poultry.

So, when such men as these feed it and continue to feed it, it must be good.

Besides these gentlemen we have on our books the names of over 500 customers who live within a few miles of Petaluma. This speaks well for our home trade and our shipping trade is increasing rapidly.

Goods Brought From All Parts of the World.

Few realize the immense amount of goods purchased to make our Coulson's poultry foods. A carload of millet seed has been contracted for at St. Paul, Minn., to be delivered to A. R. Coulson & Co., Petaluma, by the first of November. Three carloads of prime cotton seed meal is to arrive in November and December from cotton mills near St. Louis, Mo. We buy flaxseed and oil meal from Oregon and shorts and middlings from mills in the State of Washington, contracting for them several weeks ahead. We get corn that comes from Kansas, rice from China, chile peppers from Japan, coaconut meal from Mexico, powdered willow charcoal that comes in car lots from the states of Pennsylvania and New York, high grade deodorized blood meal from packing houses in Kansas City, fresh ground butcher's bones shipped weekly from San Francisco, burnt bone, charcoal, from San Francisco, ginger root from Africa, fenugreek from France and Germany, pepper from Japan, sulphur from France, ground eastern oyster shells from Atlantic coast, hulled oats and pea meals from San Francisco and other grains and feeds from all parts of the Pacific coast wherever we can get choicest feed at lowest prices.

Just Off the Press, 10,000 36-Page Books, a combined catalog and poultry account book, free to poultrymen.

Petaluma Hens Fed on Coulson's Poultry Feed

If you are in the poultry business, why not get two or three of your neighobrs to go in with you and purchase a carload of this feed and get the lowest prices and less freight.

Coulson's Egg and Feather Food, a balanced ration for laying hens, Coulson's Chick food for little chicks, Coulson's poultry foods are now for sale by more than 100 stores in California.

If no store handles it in your town, write to us and you can have it shipped to you by steamer or freight.

RECOMMENDED FOR MERIT.

Petaluma, March 28, 1903.

A. R. Coulson, Petaluma, Cal.—Dear Sir: We have been feeding your chick and egg food for the last three months, and find them all right. The egg food is O. K. for when one feeds it he is sure to get more eggs.

And for the chick food, it cannot be beat, for our chicks are looking fine and our last batch of 310 is a week old and we have only lost two. The other hatch that came off on February 22nd are as tough as nails as they have been fed on Coulson's food right along.

We will continue to feed your foods to our little chicks and old hens.

Any one who has not fed the chick food to their chicks should give it a trial, and there will be one thing they will be pleased to find out—that they will not find many dead chicks in the brooder every morning. Attend to the brooder the way it should be run and the chick food will do the rest.

Wishing you success, we remain,
The Wild Flower Poultry Farm.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

WOMAN'S WORK IN THE POULTRY YARD.

It is with pleasure that I take up my pen again after my vacation to talk about 'Woman's Work." A busy pleasant vacation it has been, for the University of California (Berkeley) engaged me through Professor Cook, to go to the Farmer's Institutes in their University extension to talk "Poultry." I felt honored at being selected to do this, and I have greatly enjoyed meeting many bright intelligent men and women at these institutes, who greeted me as a personal friend having become acquainted with me through the columns of the Cultivator. I hope this friendship may last many years, and here let me say I greatly regret that I was obliged to leave so hurriedly at Upland to catch the train. I had to cut short much of my "talk."

The thing that impressed me most in my trip was the paternity of our good government, and the great value to all of us of the researches being made at the different experiment stations, and by the government commissioners and experts such as Professor Cook, Messrs. Maskew, Mills, Baker, Braunton, Dr. and Mrs. Sherman and others.

The government may pay these great men for a small portion of their time, but no coin can recompense them for the patience and perseverance, the constant and alert brain work, all of which is given to us as a rich feast at these institutes, helping us to combat the foes in our own lines of work, offering to us the results of their brain work to enable us to reap great harvests.

The Cultivator is working on the same lines and it is my desire to repeat some of my talks on poultry in these columns and also enlarge upon them—taking up profitable poultry keeping in all its branches, especially the commercial side, eggs, broilers, fryers, roasters, etc. One of the latest books on profitable poultry keeping says:

The outlook for the poultry industry never was better or brighter than it is today. The wide cattle ranges of the West are rapidly being taken up by homesteaders and put to other uses than for grazing cattle. Within the last few years beef has advanced greatly in price, and from being a common household commodity bids fair to become a luxury.

Poultry and eggs can be, and are, easily produced on limited ranges, and can be so cheaply produced that the selling price may be much less than it is today and still have the business show an attractive margin of profit. As the price of other meats goes soaring upward, the public will naturally turn to poultry and eggs as a cheap article of diet, and thousands more pounds of poultry and millions more eggs will be consumed. The demand is bound to increase year after year. To meet this growing demand our main dependence will be our ability to produce low cost poultry and poultry products through the aid of modern methods of artificial incubating and brooding.

* * *

DOES POULTRY PAY.

This is a question frequently asked me. Poultry does not pay an extraordinary profit to anyone. It is not a "get rich scheme," but it is decidedly more profitable for the amount of capital invested than any other legitimate business.

The veteran poultry breeder and judge, I. K. Felch says: "Women are a success in the poultry business, they do the right thing at the right time.

Fowls neglected bring failure, intelligently cared for they pay a profit, women care for them and they succeed.

On farms where fowls are well cared for the profits are often surprising and the good wife finds, not only much pleasure and healthful relaxation in attending to the wants of her feathered friends, but also has money of her own to spend.

I know one lady, who paid all the grocery bills, bought herself a nice horse, beautiful buggy, harness and robe with her "hen money."

With better care than is usually given the farm poultry can be made to yield double the present profits. The average farmer is a very busy man and even if he has an inclination for it, has very little time to devote to poultry keeping. As a rule whatever fowls are kept on a farm are cared for by the women, and frequently these fowls are the commonest scrubs and mongrels of all ages and sizes, have no regular abiding place, roost in the trees on the farm implements, and lay whenever and wherever they wish. They are seldom fed regularly, but live on waste grain or feed scattered by the other stock and it is a wonder they thrive and do as well as they do.

Where modern methods and thoroughbred poultry are introduced on the farm, the profit from the fowls soon equals or eclipses that of any of the other stock, and many a farmer's wife has, with money earned exclusively by her thoro'bred fowls, lifted the mortgage from the farm and saved her home.

A start can be made by the purchase of a few thorough-breds or even by buying eggs for hatching.

I knew in New York a farmer's daughter, college bred, who, on her return home, was more ambitious than her neighbors, and consequently would not follow the fashion there of exchanging roosters for a season, or trading settings of eggs. She sent to a breeder of thorough-bred Plymouth Rocks, for a vigorous young cockrel, that season nearly all the young fowls had Plymouth Rock feathering more or less pronounced, the following year she purchased from the same breeder another cockrel and some thoro'bred eggs and she soon developed the finest flock of Plymouth Rocks in the county. She sold eggs for settings and made a great deal more spending money than her neighbors.

Thorough-breds make more money and are more satisfactory in every way than mongrels or cross breds. They have been carefully bred for a purpose, it is no haphazard method, which may chance to succeed, they are not only finer, larger birds, but are bred to lay and will give many more eggs than scrubs.

Why do farmers keep thoroughbred cows? Why are they so particular to have the male from a butter-making family or strain?

We in the poultry business are equally particular to get the best layers, and mate them to a son of a best layer and so increase the egg production.

It is simply wonderful to note the great increase in the egg yield of the hen in the last decade.

This has been accomplished by the care and painstaking of poultry keepers and now the farmers are awakening to their opportunities, are getting the thorough-breds and making money by them as never before.

* * *

Editor Cultivator: Do you know anything about the poultry foods recommended in your paper? Please reply and oblige. MRS. J. F. Y.

I have tried Coulson's food for hens and find it excellent, it helps on the moult and is a good well- balanced ration. MRS. A. BASLEY.

The output of sweet wine in Los Angeles, San Bernardino, Orange and San Diego counties for 1902 was 1,000,000, gallons, and of commercial brandy, 40,000 gallons. It is estimated that this year's vintage will be 25 per cent. greater.

The apricots of Ventura county, estimated at about 2000 tons, are about in the warehouses. Growers are expected to get about eight cents for the fruit.

The Short Course in Dairying, offered by the University from October 6, to December 17, has been strengthened by revision of the plans. More time will be given to the subject of "Milk Production." Professor E. J. Wickson will give twelve instead of six lectures on "Grasses and Forage Plants," and Professor E. W. Major's lectures on "Feeding Farm Animals" and on "Breeds and Breeding," will be twenty instead of twelve.

The Riverside Press reports several sales of orange orchards in that vicinity and prophesies a brisk trade in that line of real estate this fall.

Hollywood, says a writer in the Rural Californian, is exceptionally fine for production of lemons. It is also unsurpassed for melons of all varieties.

The Covina High Land Citrus Union of which Gen. S. P. Jennison has long been the honored head, has just closed a very satisfactory year. C. S. Beardsley succeeds Gen. Jennison as president.

The Grain Growers' Executive Committee in session in Sacramento last week discussed the matter of doing away with sacks, the farmers to ship their grain in bulk. This would mean a saving of over $1,500,000 anually to the grain growers of California.

A colony of new bugs for destroying scale has been placed at Whittier to see if they can do some good in that locality. They are much needed to operate against the scale which is plentiful on the orange trees there.

It is reported that the San Joaquin ranch this year will produce about 80,000 sacks of lima and black-eyed beans. Limas are contracted at 3¼ cents per pound and black-eyed at 2¼ cents.

The second annual convention af the National Nut Growers' Association will be held at New Orleans, Louisiana, October 28th and 29th.

The report comes from New York that the new crop of California beet sugar was being offered to Missouri points at a price 10 cents below the minimum price named by cane sugar refiners.

The editor of the San Francisco Chronicle says Nebraska is the only State that can be considered as a competitor to California in the production of sugar beets.

The practice of disposing of orange culls to pedlers is severely criticised by growers and wholesalers. The culls can be used by extracting the juice, which when bottled makes a wholesome and saleable article.

The almond crop is nearly harvested at Fair Oaks and is better than had been expected. The olive and orange crops promise well.

POOR TIRED MOTHER.

They were talking of the glory of the land
beyond the skies,
Of the light and of the gladness to be found
in Paradise,
Of the flowers ever blooming, of the never
ceasing songs,
Of the wandering through the golden streets
of happy, white-robed throngs;
And said father, leaning cozily back in his
easy chair,
(Father always was a master hand for comfore everywhere):
"What a joyful thing 'twould be to know
that when this life is o'er,
One would straightway hear a welcome from
the dear ones gone before."
And Isabel, our eldest girl, glanced upward
from the reed
She was painting on a water jug, and murmured, "Yes, indeed!"
And Marian, the next in age, a moment
dropped her book,
And "Yes, indeed!" repeated with a most
estatic look.
But mother, gray-haired mother, who had
come to sweep the room,
With a patient smile on her thin face—leaned lightly on her broom—
Poor mother! no one ever thought how much
she had to do—
And said, "I hope it is not wrong to agree
with you,
But seems to me that when I die, before I
join the blest
I'd like just for a litle while to be in my
grave and rest."

—Margaret Eytinge.

THE NEAR ROAD.

The footpath that ran from the Warner place to the Sherman place had been much in use once, but that was when David Warner and Clara Sherman were children. For years now it had been overgrown with vines and choked with fallen branches. The families had quarreled, and the "near road" which they had so often traveled together, had become a place to be avoided.

The children, who used the footpath most, were sent away to school, that they might not meet. Mrs. Warner ceased to go to quiltings and tea parties where Mrs. Sherman was always a guest. Mrs. Sherman joined another church, five miles away.

It might have seemed that the quarrel would end when Mr. Warner died; indeed, Mr. Sherman had grown lukewarm about it as he grew older. But Mrs. Warner appeared henceforth to cherish a double grievance—her husband's and her own—and Mrs. Sherman was no whit behind her in bitterness.

Then, as it chanced, David Warner and Clara Sherman, returning from their different schools on the same day, found themselves set down at a lonesome little country station, condemned to wait for hours for a delayed train. They recognized each other, and because the family quarrel seemed to them a needless and foolish thing they renewed their early friendship at once.

The mothers fumed when the girl and the young man went home and told of the encounter, but neither of the young people realized how deep was the enmity between the women. Thus it was that when Sunday came David rode over to the church the Shermans attended, and spoke to Clara after meeting, "in the face and eyes of everybody." There were plenty of gossips to carry the tale to David's mother, and they did not delay in doing so.

The next morning, early, a tall, gaunt old woman shut the gate of the Warner place behind her and took her way down the main road. She was going to "have it out" with Susan Sherman, the woman who was using her daughter to win a son away from his mother. Melinda Warner saw through the scheme! She meant to confront the woman in her own house and tell her so.

It was so early that the woods on one side of the road were still alive with bird songs. In the fields on the other side the men were cutting corn. She could hear them calling to one another with a great deal of light laughter; but she knew that David's voice was silent, although he was working there. For the first time in his life she had had a disagreement with her boy—and all on account of those Shermans.

Down the slope of the hill, along the pleasant valley and up the farther slope she went. Years had passed since she had last traveled it, but she knew every inch of the road. How the vines over the Shermans' front porch had grown since she saw them last! She stood under the shadow of them for a moment—a poor, lonely old woman, remembering old times; then she raised her hand and gave a loud knock at the open door.

No one responded. She could see that the front room was empty, but a sound of sobbing came from the room beyond, and she went in. A girl who seemed to have been lying across the bed sat up and pushed her hair from a tear-stained face.

"Where is your mother?" demanded the stern old woman in the doorway. The question recalled Clara's griefs.

"Oh!" she cried, with a fresh burst of tears, "she has gone over to Mrs. Warner's—and she is so angry—and I know she'll say something dreadful and make the quarrel worse than ever—and all because David and I don't want to be enemies! Why should we be enemies? Why should this silly quarrel go on? And now she's gone over there to insult David and his mother, and they'll never forgive it."

"She won't find David or his mother at home to be insulted," said the old woman in the doorway, trembling with passion. "My son is in the field at work, and I'm here."

Clara sprang to her feet with a cry of delight. Before the astonished old woman could think the girl had thrown both arms around her neck and kissed her.

"Oh, I know you now!" the girl exclaimed. "Don't you remember the little red-headed Sherman girl you used to pet because you hadn't any little girl of your own? I'm Clara. Don't you remember the time I sprained my ankle, and how you carried me all the way home, and how I didn't want to go away again? How proud you must be of David! Isn't he a splendid fellow?"

The round young arms about her neck, the fresh young cheek against her withered face, the old time called back by this sweet young voice!

The bitter old woman had passed many lonely, loveless years. Her son had been away, engrossed in his studies. She had felt herself shut off from the world. And here, all at once, was this girl with her loving words and her caresses—and at her touch the fountains of the great deep were broken up. The angry old woman found herself clasping her enemy's daughter to her breast and weeping convulsively.

"I wish I'd had a girl like you!" she cried, desolately. "Maybe if I had it wouldn't have happened. Maybe I'd been more patient and more forgivin'. It's easier for people to be good when they're petted and loved."

The sharp little woman from the Sherman house had shut her own gate behind her with an emphatic click that morning and had resolutely made her way down the lane and across the footbridge, and so along the near road.

She had taken that course almost unconsciously, and she was halfway down the valley before she woke to a realization of the scenes through which she was passing.

Then she perseveringly recalled her grievances, instead of her pleasant memories. She would not be touched by the vines that trailed across the near road and the trees that had fallen and blocked it up. If the near road was in ruins, so was the old past when the Warner's were her friends and she was theirs.

Up the slope the Warner house came into view. Windows and doors were wide open, but there was no sign of anyone stirring.

"Mother!" she heard someone call. Somebody came in by the back way, tramping through the rooms. Mrs. Sherman turned toward a pallid young man, who staggered a little as he advanced, and who gazed at her with eyes that did not appear to see.

"I've slashed my hand with a knife," he murmured. "Do you think you

Men's Suits

Odds and ends and broken lots from the $12.-50, $15, $18 and $20 lines.

Men who've profited by our $10 sales of the past were the first ones to buy in this.

Broad variety yet, and every one a bargain that will give us another clinch on your friendship.

could wrap it up? It's been bleeding pretty badly, but,"——

He wavered and would have fallen, but in an instant her arm was about him and she was helping him to the bench.

"You set right down there, David," she cried, " and I'll get you a pillow, so's you can lie down!"

She darted into a well-remembered room and came back with a pillow. "There, now, you lie still. I used to know where M'lindy kept her rags," she muttered. "Yes, here they are, in the same old closet—and if she ain't using the very rag-bag I made her when David was a little boy! To think she didn't throw it away! And I bet I could put my hand on the turpentine bottle with my eyes shut!"

She needed to know where it was, for her eyes were full of tears. But deftly and rapidly she dressed the wounded hand; and then, seeing that David lay still and was very pale, she bathed his face and fanned him with his mother's fan.

"It'll be all right in a day or two, Davy," she said. "The turpentine'll draw the soreness out. Don't you remember when you were little and cut your wrist on a broken bottle over at my house how I fixed it up for you?" and look here! It didn't even leave a scar"——

A little stir behind her made her turn, to see David's mother standing hand in hand with Clara.

"O M'lindy' don't ye be frightened!" she cried. "He ain't hurt much. He'll be over it in a little while."

"There, don't you worry now, M'lindy! It's all over—we're friends again—and I know in reason I must have been to blame. Look here! Davy's coming round all right—and there's Clara laughing and crying all at once—and you ain't got a thing to cry for, M'lindy!"

David was all right an hour or two later, or sufficiently so to escort Mrs. Sherman and her daughter home. But Mr. Sherman, who had been much puzzled by the absence of his family, gaped in apparent bewilderment when his wife and daughter fell to hugging him and talking jubilantly, both at once.

Perhaps he understood, however, more than they told; for there was a shrewd twinkle in his eyes when finally he said:

I calc'late that cut won't lay you up very long, Dave. S'pose you come over Saturday, and we'll take a day off and clean out the near road?"—Youth's Companion.

DISEASE IN DISHCLOTHS.

As you value your own life and that of your family, keep your dishcloths clean. A newspaper paragraph tells us that a foul dishcloth thrown under a kitchen sink brought typhoid fever into a Kentucky family, which took four persons out of it in as many weeks. For a time it was the general belief that the four deaths were "by the visitation of God," but a keen scented nurse set to work to find out some earthly cause for the dreadful scourge, and found it in a "death-dealing dishcloth." The newspaper report of the case tells us that the doctor ordered the vinegar barrels whitewashed and threw forty cents' worth of carbolic acid in the swill pail, and then washed his hands clean of the sad circumstances. The nurse who discovered the seeds of pestilence in that lazar-house took all the "visitation of God" out of the incident by saying that of the dozen of cloths she found when she went into the house not one was free from filth and microbes of which there were enough to poison a regiment of men. The moral to this story is clear. Keep your dishcloths clean.

A paper printed at Kokomo, Indiana, is responsible for the following story:

The wife of a farmer is said to have had a sister come from Chicago to make a visit recently. One day the threshers came and the guest insisted on doing the work alone and sent her sister away for rest. When the hungry threshers filed in to supper that night they found a sandwich tied with ribbon, one chicken croquette, one cheese ball the size of a marble and a button hole bouquet at each plate—nothing more. The men refused to come back for breakfast.

RECIPES.

ORANGE STRAWS.—Save the peel from all the oranges used in the house, putting it into a large bowl of water and keeping it a week—changing the water daily. This takes all the poison out of the peel and leaves it with a delicious flavor. For the peel of six oranges take one pound of granulated sugar and one-half cup of water. Boil until it "hairs;" then add the orange peel which has previously been cut into very thin strips and laid on a clean towel to absorb the water; stir until the sugar hardens all over the little strips of peel, and pour onto a platter. Pick the mass apart before it nardens into a big lump, and you will have something dainty and delicious. These are often served at an afternoon tea.

CHOPPED EGGS.—This is an excellent breakfast dish for children. Chop fine six hard-boiled eggs and grate about an equal amount of stale bread. Put in a dish alternate layers of the eggs and bread, seasoning each layer well with salt, pepper, and bits of butter. When the dish is filled, or the material all used, pour on one pint of boiling milk, seasoned with a couple of pieces of onion. Bake a light brown, and serve hot.

FRIED SALT PORK.—Salt pork sounds like a very common order of diet, but prepared in the following fashion it makes a dish to tempt the appetite of the proverbially bad breakfast eater. Slice good hard pork into a pan, pour on cold water, and let it come to a boil. Unless the pork is very salty, this will freshen it sufficiently. Remove the meat and throw away the water. Make a batter of one beaten egg, two table-spoonsful of milk and one of flour, well beaten together. Dip the pork in the batter and fry it slowly in a little fat in a frying-pan. When this is served hot it makes a most satisfactory breakfast side dish.

BROILED SAUSAGE.—Those who confine their cooking of sausages to tossing them into a frying pan, turning them over a couple of times, and calling them cooked when they are brown on two strips of their surface do not realize the possibilites of food. Suppose the next time you have sausages for breakfast you take off their skin and flatten them to half their thickness. Then put them in a wire broiler and place them over a bright fire until they are done "to a turn." While they are broiling prepare as many slices of carefully browned toast as there are to be persons at the meal. Lay the sausages on the toast and arrange them on a platter with a small lump of butter on each piece. Allow the platter to remain in the oven for a few moments before serving, and you will have a revelation in sausages.

Try cranberries for malaria.
Try a sun bath for rheumatism.
Try clam broth for a weak stomach.
Try cranberry poultice for erysipelas.
Try eating fresh radishes and yellow turnips for gravel.
Try swallowing saliva when troubled with sour stomach.
Try eating onions and horseradish to relieve dropsical swellings.
Try buttermilk for the removal of freckles, tan and outternut stains.
Try the croup tippet when a child is likely to be troubled with croup.
Try hot flannel over the seat of neuralgic pain and renew frequently.
Try taking cod liver oil in tomato catsup if you want to make it palatable.
Try hard cider—a wine glassful 3 times a day—for ague and rheumatism.
Try taking a nap in the afternoon if you are going to be out late in the evening.
Try breathing the fumes of turpentine or carbolic acid to relieve whooping cough.
Try a cloth wrung out from cold water put about the neck at night for a sore throat.
Try walking with your hands behind you if you find yourself becoming bent forward.

In order to prove that she is the greatest cheese-producing State in the world, New York proposes to manufacture a mammoth cheese, weighing two tons, to be exhibited at the St. Louis Exposition next year.

BY ERNEST BRAUNTON, GLENDALE CAL.

THE CALLA LILY AND ITS CULTIVATION.

The "Lily of the Nile" (Richardia Africana, or Ethiopiea), also more popllarly known as the "Calla Lily," is one of our most common and generally cultivated plants for winter flowering.

The horticultural world has known it for nearly two centuries, and, like everything else that is subject to the ever-changing caprices of public opinion, it has had its days of popularity and times of almost contemptuous disfavor.

The sages of all ages tell us that "Nothing dies; 'tis only superseded." The Calla has not been exempt from this rule, but its ubiquity has been persistent. Consigned to disuse time and again, under the glare for a time, of some more popular star, it has patiently withstood popular opinion and the ever-changing, ever-recurring dictates of Dame Fashion.

"The survival of the fittest" is here exemplified. Last Easter saw the flowers in good demand, and they sold at a figure about equal to that of the Easter Lily itself. There are many who still believe that the proper place for the Calla is at the altar steps, or upon the bier of the dead, and so do not welcome the flower for ordinary use.

We do not claim that the Richardia is by any means a fit subject for a table decoration, but when used along with its own leaves it makes a very appropriate embellishment for a hall or stairway and is not out of place in the drawing room.

Until recently Richardias were generally believed to be entirely free from any disease, but along with some of the California product came a scourge which upset many a promising batch. Different growers have their own peculiar ideas regarding the treatment of the Calla, and it survives and flourishes under all of them. But especially does it grow in luxuriant proportions in Southern California where the soil conditions are most favorable to its highest developments.

The yellow Callas are too expensive to be popular as yet, and we question if they will ever fill the place that the white ones have done. They are very beautiful just the same, and the yellow is so pronounced as to show its distinctive color even under artificial light. They need a slightly higher temperature.

Little Gem is a dwarf white which in our opinion, is misnamed—at least we have been unable to find any gem-like qualities in it. There are always enough Little Gems sizes among the general collection; more than are wished for in most cases.

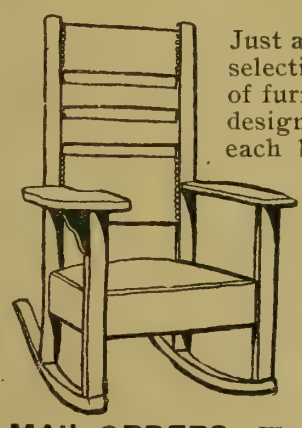
The spotted leaved variety (albomaculata) does well as a house or conservatory plant, and also does nicely around the edge of a pond or fountain, but does not flower so freely as the type.

A recently introduced plant, a hybrid, from the yellow Calla, R. Elliottiana, and the last named was raised in New England, and was fully described in American Gardening for July 19, 1902, by Mr. Orpet. We have not grown it, but understand it is hardy and a fine flowerer, the spatches being a pale yellow. It is shown in the accompanying picture.—J. T. Scott in American Gardening.

The Forestry Association of Northern California is making a vigorous effort to preserve the famous live oak which made that section of the which has made that section of the State so famous.

Dependable Furniture at a Fair Price

CHAIRS
OF EVERY KIND



Just as much attention should be paid to the selection of suitable chairs as any other piece of furniture. Like every thing else they are designed for special uses and particular places, each being built after special designs best suited to them. There is no chair need that we cannot supply. Our stock is very large and comprises every desirable style from the finest parlor and library chair to the old hickory for the lawn or porch. Our chairs are made for service. They are "good chairs."

MAIL ORDERS.—We give all mail orders our most careful attention. If you write plainly just what you want we will ship it to you. We guarantee satisfaction. All prices marked in plain figures.

STENOGRAPHIC AND CLASSICAL COLLEGE
BOOKKEEPING PREPARATORY DEPTS.

953-955-957 West Seventh St., Los Angeles, Cal.

Pleasant study in the midst of the most beautiful home-like surroundings. Day and evening sessions. Shorthand made easy by famous "Chalk Talks" by the Principal. Machine at home free of charge. Spanish at lowest rates. Every graduate in a position. Ten teachers. Largest capacity in the city. The Bookkeeping is the famous Budget System. Classical College Preparatory Dept. fits for State University. Send for illustrated Catalogue. FLORIDA BROWNSBERGER, Principal.

Los Angeles Markets.

LOS ANGELES, Sept. 24.

The local markets presented no especial change from last week except a slight advance on eggs. The supply does not equal the demand as yet although dealers appear to think there may be more easiness in the market later.

There is no change in poultry prices from last week's quotations. The demand as usual is beyond the supply. Potatoes remain at about last week's prices and firm.

Hay and grain are about stored. Price firm.

San Francisco Markets.

Dairy.

San Francisco, Sept. 23.

There has not been an over active butter market this week, operations being confined to actual requirements, supplies being moderate. The market continued firm at prevailing prices. In the cheaper grades of butter the movement continued firm at uneven prices. Yesterday there were liberal sales of the better grades at the top quotations.

BUTTER—Per lb:

Creamy extras	.31 @32
Creamery, good to fancy	.27 @30
Dairy extras	.25 @26
Dairy choice	.21 @24
Store	.18 @20
California storage	.24 @26
Eastern Creamery	.23 @25

CHEESE—Per lb:

Cal. Creamery, mild new, extra	.14 @15
Cal. Creamery, mild new, choice	.13½@14
Young America	.14 @15½
Eastern, New York Cream, Cheddars and flats, new	.14½@16

Eggs and Poultry.

There is no material change in the condition of the market for Eggs. Receipts of Ranch are moderate and include but a very small quantity of selected whites, which keep entirely cleaned up at the highest quotation. The movement in storage goods continues of large volume and the appearing prices rule firm for available offerings. Yesterday the following quotations ruled on Eggs.

EGGS—Per doz:

Ranch, selected large	.37½@38½
Ranch, good to choice	.32½@37
Store	Nominal
California storage	.25 @27
Eastern	.22 @26

POULTRY—The Poultry market continued steady this week at the prevailing prices and general offerings were well cared for within the quoted range of prices. The demand, however, lacked the buoyancy that was so characteristic last week. Prices ruled yesterday as follows: Old Roosters, per doz, $4.50@5; young Roosters, $5@6; Fryers, $3.50 @4.50; Broilers, large, $3@4; small, $2.50@3; Hens, $4.50@5.50; Ducks, per doz., old, $4@5; young, $5@6; Turkeys, young, per lb., 20@ 23c; Geese, per pair, $1.50@1.75; Goslings, $2@2.50; Pigeons, per doz., young, $1.50@2; do, old, $1.50.

Fruits and Vegetables.

The market for Deciduous fruits has been quieter the past two or three days, with little interest beyond supplying immediate wants. Under liberal offerings of ordinary quality Peaches lower prices were quoted and the market was inclined toward easiness. The top quotations were extremes for the best Fruit on hand and were only obtained in a small way. There were no Strawberry Freestones or highly attractive Yellows offered, otherwise a higher range of prices would have prevailed. Strictly fancy Bartlett Pears were offered sparingly and commanded the improved rate. There was some second crop stock on sale at the lower figure, which met with a fair movement. Prunes were well sustained at former prices. A few Coe's Late Red Plums were received late in the day, but were not sold. There were scant supplies of really fancy apples and top quality offerings ruled firm at the maximum quotatons. Irregular prices continued for the offerings of the cheaper fruit under a slow outward movement. It is reported that Watsonville driers are offering but $4 a ton for the cheaper grades of Apples in that section. As a result of such a low figure it is believed that large lines of this Fruit will be directed to this market, as growers are not inclined to accept such a low rate. Yesterday's offerings of both Quinces and Pomegranates were heavy and the market continued weak, with prices leaning toward easiness. Figs were fairly steady. There was no improvement in the market for Melons and large orders could have been easily filled within the quoted range of prices.

In Citrus Fruits existing conditions showed no important variance and the prevailing prices for the various varieties were maintained with a marked degree of steadiness.

DECIDUOUS FRUITS.—Apples, per box, common to choice, 40@85c; fancy, $1@1.25.

Peaches—Per box, 35@70c; carriers, 50@65c; large open boxes, 65@85c; bulk, per ton, $20 @25.

Pears—Per box, Bartlett, $1.25@1.75; other varieties, per box, 40@85c.

Prunes—Per box or crate, 50@65c.

Figs—Per box, 40c@$1.

Cantaloupes—Per crate, $1.25@2.

Nutmeg Melons—Per box, 50c@$1.

Watermelons—Each, 10@20c.

Table Grapes, per small box, nominal; Seedless, 60@75c; other varieties, 35@60c; crate, 50@75c; Isabella, 60@75c; large box, 60c@$1, as to variety; Wine Grapes, per ton, Zinfandel, $20@26.

Quinces—Per box, 25@60c.

BERRIES—Per chest: Strawberries, Longworth, $5@8; large varieties, $2@6; Blackberries, $2.50@6; Raspberries, $5@8; Huckleberries, per lb., 6@8c.

TROPICAL FRUITS.—Bananas, per bunch, Hawaiian, $1@1.75; Bluefields, ——; Pineapples, per doz., $1.50@3; Dates, Fard, per lb, 7@9c; do, Persian, 6@6½c.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal; Valencias, $1.25@ 2.50; Lemons, $1@3; extra, $3.50;; Grape Fruit, $1.75@2.25; Limes, $8@8.50.

VEGETABLES—Tomatoes, per box, 35@ 65c; Green Peppers, per box, Bell, 30@50c; Chile, 30c@50;; String Beans, per lb., 3@4c; Wax, 3@4c; Lima, per lb., 3@4c; Green Peas, per lb., 2@3c; Egg Plant, per box, 30@50c; Summer Squash, per box, 40@50c; Cucumbers, per box, 40@50c; Garlic, per lb, 2@3c; Green Corn, per sack, $1@1.50; crate, $1.25@1.75; Okra, per box, 35@50c; Marrowfat Squash, per ton, $10@12.50.

ONIONS—Yellow, per ctl., 50@65c.

POTATOES—Per ctl: River Burbanks, 60c @$1; Early Rose, nominal; Salinas Burbanks, $1.25@$1.40; Sweet Potatoes, $1.40.

Operations in the Potato market for local accounts were of good volume yesterday, and as supplies were fully up to trade requirements the prevailing prices ruled steady, with top quality offerings readily bringing the highest figures.

Dried Fruits, Nuts, Etc.

YAGER TWO CULT NONP

Yesterday the market showed keen appreciation of the fact that the holdings of last year's crop are comparatively exhausted and that prices on dried fruits must advance. Interest centers in prunes and prices rule firm. Increased activity is noted in Apricots and the market is firmer and tending upward. Peaches continue in good request and and top quality offerings readily command the maximum rates. Other fruits are firm at quotations and the market is in a good position for the selling interests. Honey is steady at quotations, but the demand is still held within narrow confines.

DRIED FRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 5@6c; Sun Dried, ——.

Apricots—Royal, fancy, 9@9½c; choice, 7½ @8½c; Moorparks, choice, 9@11c.

Peaches—Choice, 5½@6½c; fancy, 7@7½c, peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2⅞@3c for Santa Clara; other sections, ½c less.

Nectarines—White, 4@5c.

Figs—White, 4½@5c; Black ——.

NUTS—Per lb: California almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12½c; standard 7@8c; Pecans, 11@12c; Peanuts, nominal; Peanuts, Eastern, 5½@ 6c; do, California, 5@6c; Brazil, 12@13c; Filberts, 11@12c; California Walnuts, soft shells, 12@13c; Hickory, nominal; Chesnuts, Italian, nominal; Cocoanut, $4.50@5 per hundred.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b. at common shipping points are as follows: Loose Muscatels, 2-crown, 6@6¼c, 3-crown, 6¼@6½c; 4-crown, 6¾@7c.

HONEY—New Comb, per lb., White, 12@ 13c; Light Amber, 11¼@12c; Extracted Water White, 6½c.

Live Stock.

Previous prices for Live Stock are without quotable change and the market presents a steady tone, with current trading of satisfactory volume to the selling interests.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin steers, 6½@7c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 5@5½c, gross weight; heavy, 4¼@4¾c, gross weight.

SHEEP—Per lb.: Fat Wethers, No. 1, 3½ @4c; gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head of 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 140 lbs and over, 5¾@6c; weighing under 130 lbs., 5¼@5½c; weighing 260 to 350 lbs., 5½c; rough heavy, 4½@5c.

Hay and Feed Stuffs:

STRAW—Good to choice, per bale, 45@60c.

FEED CORNMEAL—Choice grades, per ton, $32@33.

HAY—Prices on new Hay, per ton: Wheat, $11@15; Wheat and Oat, $10@13; Oat, $9@ 12.50; Barley, $8.50@11; Clover, $9@10.50; Alfalfa, $9@11.50; Stock, $8@9.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26@28.

BRAN—Per ton, $22@23.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

CRACKED CORN—Choice quality, per ton, $33@34.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@ 4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—New crop: No. 1 shipping, per ctl, $1.40; choice, $1.42½; White Milling, good to choice, $1.45@1.55.

BARLEY—New crop: Choice, No. 1 Feed, $1.07½@1.13; Shipping, $1.15@1.17½; Brewing, No. 1, $1.17½@1.25; Chevalier, $1.35@1.50.

CORN—Good to choice, per ctl: California, new, large yellow, $1.50@1.55; small do, $1.75 @$1.80; White, $1.50@1.55.

RYE—Good to choice, per ctl., $1.25@1.30.

OATS—Feed, good to choice White, $1.22½@ $1.32½; White Milling, $1.32½@1.37½; Red, $1.20@1.32½; Black, nominal at $1.40@1.65.

BEANS AND SEEDS.

Beans were moderately active within quoed range of prices, choice lots selling well up to the higest quotations. In Seeds business continued at a low ebb and the appearing prices were regarded as largely nominal.

BEANS—Price per ctl.: Large Whites, $3@ 3.10; small, do, $3.10@3.25; Pea, 3.25@3.50; Lima, $3.50@3.75; Red, $2.90@3; Pink, $2.75@ 3; Bayo, $2.75@2.90; Blackeyes, $2.60@2.85; Red Kidneys, $3.75@4.

DRIED PEAS—Green, $1.80.

SEEDS—Prices per ctl.: Yellow Mustard, $2.50@3; Trieste, $2.75@3.25; Canary, imported, $5.50; Hemp, $3.50; Flax, $1.75@2, Rape, $1.75@2.50; Timothy, $5.75@6.50; Alfalfa nominal.

Hops.

The price for new crop is 21@25c per lb., according to quality.

Wool.

WOOL—Spring clip, per lb.: California, Humboldt and Mendocino, 18@20c; Northern, 15c@17½c; Foothill choice, 12@15c; fancy, 14 @16c; San Joaquin, ordinary, 9@11c; fancy, 11@13c; Nevada, 12@15c; Valley, Oregon, 15@ 18c.

Eastern Markets.

Grain and Produce.

CHICAGO, Sept. 23.—Wheat opened firm, influenced largely by the bull sentiment carried over from last night, December selling early up to 73¾, but the fine weather, the bearish situation in foreign markets and weakness which finally ruled in the Northwest and at St. Louis induced heavy selling by commission houses and the feeling turned bearish. December went off to 77¾ under the pressure. The absence of export business was a depressing factor, while cables were indifferent at the close. Local traders bought freely, however, on the sharp bulge in corn prices, while wheat was at the low mark and the close showed a portion of the loss regained, but with December still 1¼ under yesterday's final figures, at 77¼@77⅜. Trading was large and active. Corn, after opening at a trifle higher, was dragged down by the weakness in wheat, but later renewed its upward tendency, and the close was ⅛@¼ better for the December option at 47⅝@47¼. Oats showed considerable strength the greater part of the day, in sympathy with corn. December closed ¼@⅜ higher, at 37¾@37⅞. The provision market was also slow. October pork closed 10 lower, lard 15 lower, and ribs 5 lower.

CHOICE OF 3 ROUTES

EAST AND WEST

"SUNSET" Via El Paso and New Orleans

"OGDEN" Via San Francisco and Portland

"SHASTA"

The service on these trains is perfect. The time is the fastest. The scenery most beautiful. The tourist car service appeals most directly to those who desire to travel at a high rate of speed, but prefer to economize a little on sleeping car accommodations The Southern Pacific runs personally conducted tourist excursions every day in the week at reduced rates to various points in the east, without change, via all routes. A conductor accompanies the train to destination, and is ever ready to attend to the wants of the traveler.

California Dried Fruits.

NEW YORK, Sept 23.—The market for evaporated apples was quiet and without material change from the general conditions recently reported. Common, 4@5; prime, 5¼@5¾; choice, 6@6½; fancy, 6¾@7½. Spot prunes are in fair demand and ruled firm at quotations ranging from 3¼ to 7 for all grades. Apricots attract a fair jobbing demand and remain firm at 9¼@9½ for choice; 9¾@10¼ for extra choice, and 10@12 for fancy. Peaches show a firmer tone. Choice are reported at 7¼ and extra choice at 7¾@8¼.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

ORANGE MARKET.—The markets in general have impoved during the week, auction markets showing fair demand and quite satisfactory prices for good stock. Western markets also have been taking fruit at fairly satisfactory prices in limited quantities, particularly cars running to desirable sizes, of which there are but few. Shipments from California are very light and prospects fair for a continuance of good prices.

The lemon market is showing considerable strength on 300s, these sizes selling on an average of about $1.50 per box above 360s in sales of foreign stock in New York. The demand is fair in western markets for desirable sizes and grades, poor quality fruit is not wanted, and there is little demand for small sizes. Central and Eastern markets are calling for 300s and fancy supply. Shipments being very light and choice, the demand [illegible] in this size.

* * * *

Shipments of citrus fruits from Southern California on Tuesday were 3 carloads of oranges and one of lemons. The total shipments for the season, from November 1, 1902, to date, are 22,018 carloads, of which number 2630 carloads were lemons.

The pulp of the sugar beet is rapidly coming to the front as dairy feed.

Jersey Bulletin: "With the doctors asserting that bread is chiefly valuable as a vehicle for butter, and that the nutriment in 'breakfast cereals' consists largely in the cream which floats them; with the soda fountains dispensing whole milk and "alf-and-'alf' the barkeepers serving less beer and more buttermilk, the dairy cow seems to be having her day."

Jersey Bulletin: Allowing that every cow was first charged with the expenses of her keep, the average net profit per year per cow was $9.96. The gratest profit was $57.22 for an individual cow, and the poorest one lost $17.83. This is the result of an investigation of eight herds of dairy cattle in the state of Illinois.

In an excellent Illinois dairy herd, one of the best in the state, fifteen of the best cows paid for their keep and a profit of $651.94 for the year, and the other thirty-two paid for their keep also and gave a profit of $600.24 for the year. This shows that it pays to keep the best cows if you can find them.

Dakota dairy bulletin says: "Experience has shown that heifers should not be bred until they are from eighteen to twenty months old, and if fed liberally up to this time they will be much larger and much more profitable cows."

Have low perches for large fowls. They save bumble foot.

WANTED—A JOB AS FOREMAN OF CITrus orchards. I understand irrigation, fumigation, spraying, etc. Am a married man. Address P. KITCHEN, Tropico.

ALFALFA FARM FOR SALE—

40 acres, (18 in alfalfa) well improved, three flowing wells with good pumping plant, almost new, with 500 feet of 6-inch irrigating pipe. Windmill with 2,500 gal. tank. Large barn, four-room house, all fenced and cross-fenced. Located one mile west of Hynes, 12 miles from Los Angeles. Price, $5,000.

J. W. GAINES, Hynes, Cal.

SUMMONS.
No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 14 day of Sept., A. D. 1903.

C. G. KEYES, Clerk.
(Seal) By C. O. Winters, Deputy Clerk.

The Walnut---Its Blight and Suggested Remedies

The blight which has attacked the walnut orchards in Southern California has caused much apprehension to growers, and the definite cause of the blight is a subject on which the most experienced orchardists differ. That there is blight on the trees no one will deny, but what causes it is a question those interested in the walnut industry are anxious to have determined.

That the crop failure for 1903 is worse than for many years is a recognized fact, for this season seems to have been fruitful in producing both the blight and non-pollenization conditions, and therefore the results have been marked and widespread. J. B. Neff, one of the largest walnut growers in this part of the state, is of the opinion that the non-pollinization of the walnut blossom by the abundant rains and succeeding dark cold days is largely the cause of the short crop.

George Ware, of Garden Grove, has observed that many more nuts are diseased this year than common and that many more have received the attack right at the blossom end of the nut, rather than on the side. Mr. Ware thinks that the exceeding moisture at the time of blossom was favorable to the work of the germ and thus the exceeding damage of the present year. In this connection Prof. Cook suggests that it might be well to determine whether the Bordeaux would greatly injure the blossoms. In case it is found that it would not it would certainly be wise, he says, to try in case the atmosphere is very moist, this remedy during the blossoming period. Bees do not work on walnut blossoms, and so would not be poisoned. Mr. Ware feels certain that the Bordeaux mixture can be made much more effective by giving wise attention to atmospheric conditions. He says also that his observation is that walnut trees next to the highway, especially if there is much dust, are largely free from the trouble. The dust seems to unfit the nut as a seed bed for this bacillus. This certainly suggests come desirable experiments.

The Professor further suggests: "Would it be possible by use of oil pots and burning oil to cheaply coat the nuts with soot that might entirely prevent the work of the bacilli. In lieu of this, would it be possible, by the aid of the new machinery recommended for dusting trees with poisons, to throw lime or road dust onto the trees at the time of bloom and setting of the nuts so as to hold the bacteria at bay?" Without making any recommendation on this point it is safe to say there is a promising field for experiment along this line.

It will be interesting, in this connection, to compare the yield of walnut orchards in the past four years as indicating the probable truth of the theories advanced by Messrs. Neff and Ware, that the abundant rainfall and cold, dark days destroys pollenization of the nut bloom. We quote here data from a diary kept by Mr. Neff, which he has courteously given the Cultivator. In this report we find that in:

1900 the leaves and catkins began to show on March 22nd. This was also a year of showers until May 11th, and a light crop that year.

In 1901 the leaves and catkins showed on March 19th, but there was only five showery days afterward, with sunshine immediately following the showers, and a full crop of walnuts was gathered.

On April 9th, 1902, walnut leaves and catkins began to show. In this year there were eighteen foggy and cloudy mornings in April, twelve cloudy and foggy mornings in May, and twenty-seven such mornings in June, in all fifty-seven cloudy cold mornings to July first.

Picking Walnuts on J. B. Rea's Ranch, Orange County.

In 1903 the walnut leaves and catkins began to show March 22, and in this month there were seven dark days. In April twelve, in May eighteen, in June twenty-two, in all fifty-nine foggy and cloudy mornings to July 1st. Eleven days are noted between above dates in 1903 as cloudy all day.

In 1902 there were no wholly cloudy days noted during blooming time.

Walnut trees were in bloom two weeks earlier in 1903 than in 1902. In 1903 the heaviest rains of the season came March 24 and 25, March 29 to April 2nd, and April 16 and 17, when the walnuts were in full bloom . There were also showers on 10th and 14th of April, with cool damp weather during the entire time. This evidently destroyed the pollen to a large extent and prevented fertilization, and at the same time made the most favorable weather for development of blight that we have had for at least ten years.

It will appear then, from the above comparison of yearly data for the past four years that when the moisture has been most abundant during the time walnuts were in bloom, pollenization has been least fruitful and the crop less complete. Before closing this branch of the subject it should be remarked that the trees are in fine condition and the fruit buds very abundant and the promise is fine for an abundant yield next season.

Quoting from a papeer read before a farmer's institute some yars since by J. B. Neff of Anaheim, much interesting data on the subject of walnut growing is obtained.

There are three species of walnuts that are of commercial importance in the United States—the black walnut, the butternut or white walnut, and the Persian, commonly called the English walnut. The last named is the only one of any importance in Calfornia, and probably originated in Persia or Asia Minor. From there it spread westward to Rome, and was distributed throughout continental Europe. The walnut was known to the Greeks as the "Persian" nut, or the "Royal" nut, and to the Romans as "Jupiter's Acorn," or the "Nut of the Gods," showing that it has always been held in high esteem. Until the introduction of black walnut wood, very high prices were paid for Persian walnut wood for such articles as gunstocks, and furniture. There are no records to show when walnuts were first planted in Calfornia, but they have no doubt been grown in a small way since the first missions were established.

The range of profitable cultivation of walnuts extends over a comparatively small area, so that there is but little danger of overproduction; and it is scarcely likely that enough walnuts can be produced in California to supply the demand in the United States.

There has been but little trouble to find a market for all the walnuts that have been grown in California; and, with proper methods of marketing and distribution, good prices ought to be realized for all that will be grown that are of good quality.

The poor grade walnuts are used in France for oil making, 100 pounds of walnuts producing about 18 pounds of oil, which is used largely in place of olive oil. No walnut oil in commercial quantities has been made in California.

Walnuts should be planted on land having at least six feet of good soil, not underlaid by hardpan, and where the water does not stand on the surface. There must also be water for irrigation, as walnuts need water at least twice during the summer, and three times would be better, except on land very retentive of moisture.

The trees should not be less than 45 feet apart, and 50 feet apart is better on soil that will make trees grow vigorously. If planted in this way peaches or apricots may be grown between the walnut trees, but such trees should be planted so as to have only the same number of peach or apricot as there are of walnut trees, and all equidistant. Both varieties can usually be grown together ten years, when the walnuts will need all the room, and the others have to be taken out.

In planting walnuts only the very best variety and the strongest trees should be planted, and in order to have the best, as well as a uniform variety, grafted walnuts should be planted. In selecting grafted trees for planting it is not necessary that the tallest trees be taken, as it is preferable to have good roots and a stocky stem. Trees with good roots and strong, one-year old grafts will do much better than older trees that have grown too closely in nursery rows.

Walnut trees do not require the heavy pruning that is needed by most of the deciduous fruit trees. The lower limbs should start at 4 to 5 feet from the ground, and in such a way as to have the heavy side of the tree to the southwest. A good rule for pruning is to cut off only those limbs in the way of the team when cultivating, or that will tend to draw the tree too much toward the northeast or away from the prevailing winds. The young trees should be supported by stakes for the first two or three years.

A walnut orchard that has been well cared for will begin to bear paying crops after the fifth year from planting, and will increase its yield for many years. Walnut trees will live to a very old age in suitable localities. Trees in Spain and in the south of France that are believed to be over 300 years old bear regular crops of 400 to 500 pounds of nuts.

Walnut trees are more free from pests than most orchard trees. The roots are sometimes affected by "root knots," which should be removed when on the main stem of the tree, or on the root crown, and the affected part dampened either with Bordeaux mixture or with a weak solution of sulphate of copper, which will usually prevent a return of this disease. The only other disease has been that known as "walnut bacteriosis," which has caused considerable alarm and which is not fully understood yet. This disease affects only the young wood and the growing nuts before the shells are hard.

There is also a scale known as the "walnut scale," but this does no particular damage, as it infests the large limbs principally.

MUTTERINGS OF DISCONTENT.

The delegates who have returned from the Irrigation Congress are not of the same mind as to the results obtained, nor the good it has done the country. Some of the more practical members complain that the meeting, from a common sense standpoint, was a failure that the time was taken up by a few individuals to air special hobbies greatly to the detirment of the work laid out to be accomplished. Some of the greater newspapers seriously criticise the entire proceedings, and ever that the good accomplished did not repay the expense of time, labor and money paid by the delegates, who traveled thousands of miles, in some instances, to take part in the deliberations of the congress, but were snut out by the very few individuals whose aim seemed to be to advance their personal and political interests. If this criticism is a verity it is well taken. Such a meetng should only be for one purpose, that of advancing by every possible method, the great cause in whose interest it was called. What such a convention needs is intelligent suggestion, terse and well defined opinions, based on experience, as to the best methods of acquiring results at the least expense to the state and general government. It is too bad that so important a congress should not have been provocative of such widespread results, as to create in the public mind an interest in the cause of irrigation, as deep as the subject justly merits. In this particular it is to be regretted that no special interest was created by this irrigation congress. There were but half a dozen papers read, worthy of more than passing notice, the rest were evidently written with a view of self aggrandizement and with little knowledge of the subject presented.

Geo. Y. Coutts of Orange reports the sale of Lady Hiawatha's Pedro to William Schnitger of Garden Grove, through advertising in the Cultivator.

OUR SAN FRANCISCO OFFICE.

The California Cultivator will, in its next issue, be enlarged to twenty-four pages.

The growth of the business necessitates this change. The increased circulation of this paper which is almost to the 9,000 mark, and which by January first will reach 10,000 or more, warrants the enlargement of the paper.

The growth of the Cultivator has been steady and almost phenomenal. Every month it has grown, during the past few years, broadening its territory, enlarging its business, gathering around it a clientage of the most intelligent, progressive and aggressive business men and readers of any paper of like character on the Pacific Coast. We make the assertion, without fear of successful contradiction, that no paper occupying a distinctly farming field, on this coast, has ever attained the success in the same length of time, that has been reached by the California Cultivator. It is no longer a proposition for one section of the state alone. It reaches almost as many readers—actual subscribers—north of the Tehachapi as south of it, and in that territory is rapidly taking the lead as a general newspaper devoted to the interests and industries which are building California into one of the greatest states in the Union. North and south of San Francisco the Cultivator is constantly adding subscribers in large numbers. It has been doing this steadily for the past year.

The management seeing the necessity for business headquarters in San Francisco, has opened an office on the corner of Sutter and Sansome streets in the Paris, London and American bank building, where those interested in anything pertaining to Cultivator matters will find an experienced editor and business representative with whom to transact whatever of moment man concern them.

In its treatment of questions pertaining to California farm, orchard, live stock or other interests, the Cultivator in the future, as in the past, will aim to be fair, honest and intelligent. All conditions which affect the welfare of the people of the state will be candidly discussed, and the effort at all times made to impart only reliable information on the subjects treated in its columns. With the promise of a most prosperous year before the state let every industry be pushed to its fullest capacity, to the end that at its close California may witness the greatest growth in its history .

CENTRAL CALIFORNIA FAIR

The third Annual Central Fair will be held at Hanford, King Co., Oct. 5-10. This is said to be the only Fair this year south of Sacramento and it has promised to give an exhibit of agricultural, horticultural and viticultural products of the central part of the state. The directors. and the Hanford people in general, are putting forth every effort to make this thoroughly representative of their section, and doubtless the orchards, vineyards in radius of that admirable section, will give forth some beautiful fruit as only California can.

N. P. Duncan is President, H. R. Cousin is Managing Secretary, both may be addressed at Hanford.

Annual catalogue for Poultry Foods and Poultry supplies is the title of a very attractive booklet by the A. R. Coulson Co. of Petaluma. It is on a fine grade of paper, has a number of most interesting half tone scenes of some of Petaluma's poultry yards and of the companies establishment, sale rooms, store rooms, etc. In addition, the list of supplies and foods has education as to some of the conveniences which are now prepared for poultry peopIt. One feature which adds to the book,—blank pages for an egg record with blanks for filling in "eggs gathered", "eggs sold", "amount received", "paid for supplies", etc. with spaces for each day in the month. It is a valuable booklet and worth sending for.

OILING THE STREETS.

One of the most annoying drawbacks to Southern California is the summer dust. Up to the time of the introduction of oil there was some excuse for the dust nuisance, for water was not abundant enough to wet the country streets nor could the expense be borne by country people. Now, however, there is no reason why we should longer continue to put up with this nuisance, for it has been shown conclusively that the oiled road is not only the solution to the intolerable summer dust but that it is a success in many other ways, producing pleasure in riding and driving and furnishing, if properly constructed, excellent serviceable roadways for all purposes. Of course the first thing is to put on a good foundation. On this foundation an oiled dressing or top surface is applied. Generally it consists of from two to three inches of thoroughly pulverized soil, impregnated with oil. It is then worked by machines especially devised for the purpose until it is of such a consistency that it will not "buckle" under heavy loads, yet is sufficiently firm to prevent cutting through into the sub-grade, or foundation proper. This dressing, under rolling and traffic, unifies with the foundation, making a firm, elestic and durable surface. When finished it becomes more smooth and firm in proportion to the volume of traffic. Oiled surfaced roads will last without attention from two to four years, the length of the time depending upon the usage. They should, however, be lightly sprinkled with oil annually. The cost of such sprinkling is much less than the cost of labor and teams, aside from the water used in sprinkling. With this inexpensive annual care, the roads improve to a remarkable degree. Each year will find them in better condition than when first finished. The cost of this betterment will not in five years exceed the first cost of oil surfacing, or about 1½ cents a square foot. The oiled surface is infinitely superior to the so-called gravel, which is often little better than mud. After a few years such a surface becomes practically an asphalt . Another advantage is that no weeds can grow on the street. The cost for a forty-foot street, that has been brought to grade, is 60 cents a linear foot, as compared with $1 for gravel or disintegrated granite, and $6 for asphaltum.

In this connection it should be remarked that the practice of oiling only one side of the road is objectionable. The roadway should be made convex, and when prepared for oiling should receive a thorough coat of the oil on the roadway thus prepared. The county supervisors should give this matter more attention than they do and on all the country roads leading out of the cities and towns in Southern California encourage the oiling of the roads.

ALMOST BEULAH LAND.

We do not think as a general rule, Californians talk enough about the advantages the state possesses over the states of the middle west. If we would advertise our conditions more widely, greater results would come to us in the way of desirable immigration. We have a grand country here and we ought to prize it for all it is worth. Charles Dudley Warner in speaking of California said very truly:

"It is land of small farms and gardens, highly cultivated in all the valleys and the foothills, a land therefor of luxuriance and great productiveness, and agreeable houses. It is always interesting it is always picturesque. It is the fairest field for the experiment of a contented community, without any poverty and without excessive wealth."

The latest reports from Europe are to the effect that immigration to this country will be the largest this year in its history. The only drawback to this information is that a horde of benighted foreigners will want to run the government as soon as they land in the country.

Frosts in Nebraska, Iowa and Kansas, tornadoes in Deleware, hurricanes in Florida, cyclones in New York, snow in Montana, and in California, weather so fine that it could not be excelled if ordered especially.

FORTY YEARS OF HONORED TOIL.

Seldom does it fall to the lot of one man to fill a chair in any college for the length of time Martin Kellogg occupied the chair of language in the State University of California. Men, possibly more brilliant than he, have come and gone from the University, but none have left a more enduring monument to their memory than Dr. Kellogg, in whose honor a memorial service was held on Saturday of last week. It is such a memory as any good man, interested in his country's educational and moral growth, may well desire to follow him when his life's work is ended. It is an enduring monument, more to be desired than tablets of stone.

The late President McKinley, in a moment of confidential expression to a friend, once said: "I would rather be the president of any of our great educational institutions, where the future statesmen of my country are made, than to be president of these United States." It is a well-known fact that had he lived to close his political career he greatly desired to close his life work at the head of some great school somewhere in this country.

Truly it is a coveted honor to close one's earthly career as Dr. Kellogg did. To have men and women who were molded into the best citizenship of the State look back with pride and hallowed recollections to the time when and to the man who gave them broadened ideas of life and its responsibilities.

IN THE COMMERCIAL WORLD.

Naught but encouraging reports come from the centers of trade and industry. There were grave fears expressed, up to the close of the present month, that the corn crop in the middle west would be damaged by frost. The cold and inclemment weather of September had a depressing effect upon the nerves of trade and industry and tended for a brief period to slacken the rush of orders to factories for fall and winter stocks. But the month of September went out with but little comparative loss in the corn belt; the most serious effects being in parts of Nebraska, Minnesota and Iowa. But this loss proves not to be as serious as was anticipated, and we are going into the fall trade with most encouraging prospects. The markets remain unchanged generally. Railroad earnings and bank clearings show increased gains and indicate that the country is not anticipating any serious change in present conditions.

Regarding crops, reports show that with the exception of frost in the Middle West there has been a decided improvement. Unless further injured the corn yield will be much in excess of early estimates, and it is now practically assured that the cotton crop will be over a million bales larger than in recent years. Wheat will be below recent years, but still large enough to supply demands for twelve months to come. Conservative estimates place the yield at about 650,000,000 bushels. Of this about 475,000,000 bushels will be required for home consumption, leaving 175,000,000 for export.

So far as Pacific coast industries are concerned no period in years has presented better prospects. Our crops have generally been magnificent, and the demand for California fruits, nuts, and in fact everything raised and produced in the State has been fully equal to the supply. It is of course a little early to attempt a suggestion as to next year's business, but with the rainfall we received last season and the rainfall we have reason to expect this winter a prosperous season in 1904 may be expected.

A representative of the Cultivator now in the Lompoc valley writes that crops of all kinds will be abundant. He says the apple crop will be fully up to the average and is of fine quality. No coddling moth, no worms have so far invaded this territory. Almost every orchardist has all the fruit on his trees they will bear. The corn crop is also reported very fine all through the valley. In short, a season of great prosperity abounds in San Luis Obispo and Santa Barbara counties.

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

The Alameda grape crop is heavier this year than for several years past.

The U. S. Government has leased ten acres of land in the Livermore valley to be used as an experimental station.

Lou Dillon has met her mate. A few days ago the gelding, Major Delmar, at Yonkers trotted a mile in two minutes.

Almonds are being harvested in Alameda county. The crop is a good one but the quality of the nut is not so good as last year.

The Santa Rosa Republican says: "Every notch the price of hops goes up adds many thousands of dollars to the wealth of this county."

Natural gas of a high quality has been discovered near Ventura. Experts say that a large flow will be obtained fifteen feet below the surface.

Henry Clews, the New York financier, recently said in a circular: "The great bulk of the important crops of the country are safe for this year."

Hop growers in the vicinity of Forestville are offered 25½ cents for this year's hops, but at this writing are generally holding for higher prices.

A remarkable cornstalk from Kings county is on exhibition at the rooms of the California Promotion Committee in San Francisco. It is sixteen feet in length.

Sonoma county is to have a government viticultural station, under the charge of Prof. Haufsman. The chief object is to study the diseases of the vine and propose remedies.

The California Promotion Committee have information that of 4000 persons who passed through Chicago one day quite recently on the colonist excursions, 1000 were bound for California.

The walnut crop in Ventura county is good and the quality fine. Last year the crop in the state amounted to 800 carloads. This year it is estimated at 600—possibly 700. The price will be higher this year than last.

The new co-operative cannery at Healdsburg has finished this season's work, and their entire pack has been sold at good figures. The members of the association are well pleased at the success of their experiment.

The California Dairymen's Union recently held its annual meeting. The profits of the year were $11,000. The new directors are: H. M. LeBaron, president; F. V. Nelson, P. Lognazini, J. Bruner and A. Lognazini.

On the 14th of September the government purchased 300,000 ounces of silver at an average of 57.85 cents per ounce, which will be immediately coined at the San Francisco mint into money to be sent to the Philippines.

A monster raft of 8,000,000 feet of telegraph poles—the largest raft ever built on the Pacific coast—arrived at San Francisco the 22nd of September. It was 750 feet in length and 85 feet wide. It was built at Stella, Washington.

One day this week the steamer Minnetonka took out from San Francisco for New York the largest cargo of wine that ever left that port. It consisted of 10,000 barrels of the product of California vineyards and weighed 7,000 tons.

The latest revised estimates of the California orange crop put the probable output at 28,000 cars. That is about 5,000 cars more than last year. The Florida estimate is 1,500,000 boxes, Jamaica 300,000 boxes and Porto Rico 250,000 boxes.

Steps are being taken by the affiliated colleges of the State University to establish a botanical garden in Golden Gate Park. A five-acre tract will be set out to medicinal plants for the use of students. It will be under the supervision of the pharmacy department.

A large acreage of beans was planted this year in the vicinity of Stockton. The growers are holding for a decided advance in price. They claim that the San Francisco commission houses want beans badly, and must have them, and will pay much more than they are now offering.

The State Fair was a financial success this year for the first time in several years. The profit was about $4000.

The latest estimates of the value of the crops produced this year in the United States is five billions of dollars.

To A. Rhodes of Garland, Utah, was awarded the Havemeyer cup for the best display of sugar beets at the Ogden irrigation convention.

An effort is being made to induce the Petaluma poultry men to organize a co-operative association, patterned after the Santa Rosa association.

The San Leandro Oyster Company, whose beds are located near San Leandro, is preparing to expend $75,000 in improving its wharves, warehouses and other property.

The California fruit distributors report that in the matter of pears they are met in the East by the sharp competition from Oregon, Washington, Idaho, Utah and Colorado.

The Kern County Supervisors have unofficially determined upon a tax rate of $1.60, an increase from $1.40 during the last year. Of this amount 2 cents is levied for the St. Louis Fair exhibit.

J. A. Hornstein of St. Louis, read some literature sent out by the Chamber of Commerce of Sacramento. That induced him to come to California and buy a 1000-acre farm in Sacramento county.

C. F. Packard has sold his fine ranch on the Sacramento for $139,900. The purchasers are the Glenn, Colusa & Yolo Land Company. The farm will be divided into small tracts and put on the market.

The Santa Rosa Poultry Association is still marketing its own eggs, ignoring commission men. It is claimed that the commission men have attempted to palm off on the public cold storage for fresh eggs.

Alameda county has a fund of $20,000 to be expended in advertising the county at the St. Louis Exposition. Among other things shown will be a map 14 by 20 feet prepared by the pupils of the public schools.

The Los Gatos canneries having pretty well finished canning pears and peaches are now running on tomatoes. The tomato campaign will last all through October. Packing, up to this writing, amounts to 75,000 cases.

Klondike's contribution of golden wealth to the outside world will be but little less this year than last. At least $10,000,000 will leave this camp, and the total may run up to $11,000,000. Last year it was between $11,000,000 and $12,000,000.

Articles of incorporation of the Pioneer Fruit Company have been filed in Sacramento. The new company is capitalized at $100,000. Charles B. Bills is president and general manager. He was formerly general manager of the green fruit interests of Porter Bros.

A majority of the wine grapes of Yolo county have been sold to the wineries. They were not organized and were forced to sell. "The buyers are combined," said a Yolo farmer, "and the growers were not." Zinfandels brought $13.50; Sultanas, $12; Muscats, $9, and Tokays $8 per ton.

Consul General Guenther reports that a new plant has been discovered in South America which is destined to supplant the sugar cane and beet. It contains from 20 to 30 per cent more sweet than the cane or beet. It can, in the opinion of the consul, be successfully grown in the soutnern states and in California.

A berry grower of Florin complains that the strawberry growers of his locality made no money this year. The reason was because of bad management and hap-hazard marketing. "What we need is a close corporation and co-operation. We could for less than $3000 put up a cannery that will handle all our berries that cannot be sold to advantage."

The Santa Rosa and Vallejo tanneries have consolidated their interests and have incorporated.

According to the latest advices the world's visible supply of sugar at the present time is 2,170,000 tons.

Onions may be peeled successfully; that is, without causing tears or leaving an odor on the hands, by holding them under a stream of the cold water faucet.

The Ernset Luehning Company, of Suisun, has been packing and shipping dried fruit for four or five weeks past, a large quantity of which is intended for shipment to Germany.

The demand for Woodland Creamery butter in Sacramento is unprecedented. One Sacramento firm writes the creamery and says: "What you want is more milk and we want more butter."

Notwithstanding early frosts, D. W. Snow, national crop statistician, sends out a statement in which he estimates that the United States will, this year, produce 2,000,000,000 bushels of marketable corn.

Grape picking is in progress in Fresno county. There is plenty of help to gather the crop. About 35,000 Chinese and 5,000 Japanese men are at work, besides a large force of other nationalities.

J. L. Byrne, Deputy U. S. Consul at Valencia, Spain, reports that the drought of July and August has reduced the grape crop of that country 25,000 tons below the estimates recently made.

The California Promotion Committee made an effort to induce large landholders in this state to divide up their great farms into 15 and 20 acre tracts and put them on the market. About fifty owners of large farms have consented to it. The committee hopes to induce colonists to come to California and locate on these tracts.

At a recent meeting of the directors of the California Grain Growers' Association, the statement was made that the farmers pay each year about $1,500,000 for grain sacks. This, it was claimed, might be saved to them if they would ship their grain in bulk. It was urged that the growers should provide proper storage facilities.

One of the laws passed by the last legislature is not giving universal satisfaction. It provides that before any sale or transfer of personal property exceeding a specified value can be made, the party who intends to sell must file a notice of his intention with the county recorder five days previous to the date of transfer. The notice must name the purchaser and the consideration.

At the recent Farmers' National Convention held at Niagara Falls, the statement was made that the United States consumes 2,275,746 tons of sugar yearly. Only 500,000 tons are produced at home, as follows: 300,000 cane, 195,000 of beet and 5,000 of maple. President Purse said, if we had proper legislation we could in a few years produce all we consume.

The bean growers of Ventura and Santa Barbara counties are predicting a decided advance in the price of beans, chiefly owing to a shortage of the crop in the San Joaquin valley. Last year there were 35,000 acres planted to beans in San Joaquin county. This year but about 25,000 acres. Last year Lady Washingtons sold for $2 to 2.10. Already this year they are bringing $2.50 to $2.60 and it is predicted they will go much higher.

County Veterinarian Alexander, of Yolo county, reports that he has had his hands full in dealing with anthrax among cattle, but he has vaccinated and quarantined all exposed stock and has the matter well in hand. Dr. Alexander complains that his work has been made more difficult than it should have been because owners of cattle would generally not report the disease in their herds, and many failed to burn the dead carcases of those that died.

A Sardine cannery has been established at Monterey. It is claimed that 150,000 one pound cans will be packed.

E Olmstead of the National Department of Agriculture, has come to this state from Washington and will cooperate with California in the selecting of forest reserves. $30,000 will be expended in the work, the state and general goverment sharing equally in the expenditure.

The promoters of the Independent Packing Co., the incorporation of which was noted in the Cultivator a few weeks ago, recently met in Kansas City, Mo., and finished their organization. The company is capitalized at $5,000,000. They propose to fight the Meat and Cattle Trust.

The Agricultural club of the University of California at a recent election chose its following officers: President, Andrew Vekander; vice president, Miss Myrtle Cromwell; secretry, J Hall; treasurer, Ellerslie Luther. A series of addresses is being arranged to be given by specialists on agricultrual subjects.

The Earl Fruit Company recently shipped a carload of Pajaro Red Pearmain apples to Australia. Prof. Clarke fumigated thirty boxes of the fruit with hydrocyanic acid as an experiment. The object was to destroy any codling moth eggs that might be on the apples. Each apple was wiped with a cloth to remove all substances that might be clinging to it from spraying, then each apple was wrapped in parchment.

Prof. Gifford Pinchot, head of the Forestry Bureau, has been lecturing to the students of the State University. He has corrected some current mistakes. The intention of the government is not to preserve large tracts of land and keep them idle, but the object is to increase the yield of timber and to improve and make permanent the water supplies and to preserve the grazing lands. Everthing is to be made useful.

The California Promotion Committee has been reorganized. Hereafter the following named organizations will have one representative each on the Committee, viz, the Chamber of Commerce, Merchants Association Exchange, Manufactures, Producers Assocation, City Board of Trade and State Board of Trade. The City of San Francisco will have one respresentative at large. In addition to the above, there will be an advisory committee consisting of the Governor, representative of the various Railroad organizations and commercial organizations outside of San Francisco.

Alexander Craw, Deputy Horticultural Commisioner, recently sent a colony of Scutellista to W. E. Hughes of Los Angeles county for distribution. Mr. Hughes writes to Mr. Craw that in visiting the orchard of Scott Chapman he found a considerable quantity of Scutellista there in three stages—grub, pupa and fly, doing good work. They had evidently come from an orchard half a mile distant where the insect was placed a year ago. Mr. Hughes is very enthusiastic over the work they are doing, and will do. We advise all orchardists in the state to send to Commissioner Craw for the Scutellista.

The co-operative idea is rapidly gaining among producers in this state. President A. R. Sprague, of the California Fruit Exchange, authorizes the Cultivator to say that he will be glad to furnish desired information to farmers, or other producers, either by printed matter or by oral lectures, as to the benefits of systematic co-operation. Those contemplating action along that line would do well to correspond with Mr. Sprague. His address is Sacramento. The California Fruit Exchange is well established. It has agencies in all the principal eastern cities for the sale of dried fruits under the supervision of W. C. Walker. The association of which Prof. Sprague is president handles both dried and green fruits and their business transactions are of large magnitude. All the transactions of the company are conducted openly. The profits are divided up, pro rata, among its members. There are few men in this state so thoroughly informed on the benefits of co-operation as Mr. Sprague.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

We will remember that the Crustacean class of Arthropoda all breathe water and thus are all aquatic. A few, however, like the common sow bug, get enough moisture under boards and so are really terrestrial. All myriapods breathe air and are always terrestrial. Almost all of the spider class, or Arachnoids, live upon the land, though a few spiders are found in water. It is curious that air breathing animals can live under the water. These aquatic spiders could not do so except that they spin a sort of silken diving bell which enable them to imprison and carry air to considerable depths in the water and thus they can remain submerged for quite long periods. As we noted, many of the lacewings are aquatic as larva and pupa, though most of them are entirely land insects in all stages. So far as I know, the locust order of insects are wholly confined to the land.

* * *

Order Hemiptera.—To this order belong all the bugs, plant lice and scale insects, as well as the parasitic lice. It would be well if we confined the term bug wholly to insects of this order. Unfortunately the word "bug" is generally used as a synonym of insect. It would be better to confine the name to this order and use the term lacewings, locusts, beetles, etc., in referring to insects of other orders. The hemiptera are very diverse in their habits. Many suck the juice from leaves, others from fruits and branches, others from underground roots, while not a few suck the blood of other insects or from animals of higher groups. Even man himself must support some of these insects, as the bed bug and some of the parasitic lice obtain their entire nourishment from the human body.

We remember that the orders are characterized by peculiarities of wing, mouth parts and transformations. In all typical bugs, the front wings are very thick at the base so they appear to have only half wings. This led Linnaeus to give the name Hemaiptera, which word means half wing. Their wings are the same throughout and all four wings are much the same. Upon these differences are established two sub-orders, Homoptera and Herteroptera. In the Homoptera as represented by plant lice, cicada and many leaf hoppers, the four wings are all alike, and the front wings the same throughout. In the Herteroptera, as seen in the squash bugs and chinch bugs, we have the typical hemiterous wings; that is, the base is thickened. Not a few of the hemiptera in both suborders are entirely wingless or apterous as it is termed. The wingless plant lice is a familiar example in the first suborder, while the bed bug is, fortunately, a much less well known illustration of the second.

The mouth parts of bugs are much modified and are always fitted for sucking. We find present the labrum or upper lip, first pair of jaws or mandibles, the second pair of jaws or maxillae and the larger grooved labium or under lip. The first of these is usually short and needle like, the next four are long slender and needle like, while the labium or under lip is larger and grooved. This groove is covered above by the close proximation of other parts thus forming a tube for sucking. When the bug wishes to suck blood or pump the sap, it moves the mandibles and maxillae back and forth when their fine points pierce the animals or plant and as the blood or sap exudes, it is sucked up by this vital force pump. It will be seen by the above that there are no palpi at all in this order. Thus if we find an insect without palpi, we are sure that it is a bug. This leads us to note the importance of even rather small organs as these jointed palpi are frequently so small that they cannot be well studied without a glass. I think there are no insects so well fitted to pierce and suck as are the insects of this order. We are prepared for this statement when we remember that the terrible chinch bug of the Middle West and the baneful scale insects and plant lice of our own state belong to this group.

The transformations in this group are like those in the lace-wings and locust orders, incomplete. We remember that in such cases the word nymph is given to larvae and pupae alike. Every one has observed that the little bug is essentially a bug and would be recognized as such by the veriest novice. The larvae as usual in such cases has no wings at all; the pupae has stubs of wings or wings but partially developed, while the mature insect, except in a few cases where they are wingless, has fully developed wings, and is able to fly for long distances if needs be, in search of food.

From what I have said above, it is readily conjectured that we have both friends and enemies among the hemiptera. Many bugs are predacious and by sucking the blood and life out of other insects do us great good. Others, and I think a good many more, live upon plants and in some cases, as illustrated in the famous chinch bug of Illinois and adjacent states, are hardly surpassed by any other insect in the terrible mischief which they perpetrate.

Most of the bugs live on the land, though there are quite a number of families of the Herteroptera or true bugs that live in the water, in which case they feed either upon other insects or upon aquatic plants.

* * *

Parasitica.—Comstock makes a third sub-order of hemiptera in which he places the parasitic lice. These are the bugs which prey upon our domestic animals and even man himself and are always an egregious plague. They differ from all the other bugs in being wingless and from all in having an unjointed beak. That is, their beak is in form like a lead pencil, while all other bugs have a jointed beak, and thus resemble very much the human finger, especially as there are very often three joints as in the finger, although in some cases there is an additional joint.

As is well known these parasitic lice are terribly irritating, either to man or beast. Civilization, care and a fine tooth comb, have reduced their number as parasites to human beings very greatly in the last fifty years. Careful, provident farmers have done the same for our live stock, though I must say that much more needs doing in this same direction. Especially do poultry suffer from the incursion of these irritating suckers. Other and larger domestic animals suffer less generally but not a little from other species of these pestiferous lice.

The remedy for poultry lice is frequent white washing of the house, thorough spraying with kerosene emulsion, and best of all rubbing the roost poles, and smearing the chickens after they have gained the roost at nightfall along the thighs, breast and under the wings with an anointment made of kerosene and lard, half and half. This should be kept right in the poultry house that it may always be handy, should be kept closely covered and may be applied without discomfort by use of a glove ever kept in readiness for this purpose.

Thoroughly washing with a strong decoction of tobacco will rid horses and cattle of these living plagues. The scattered hairs of hogs make it easier to apply the tobacco decoction to these animals by use of a good syringe or force pump. Mercy as well as economy dictates that we should never allow our poultry or other domestic animals to be worried by these pernicious lice.

It will be remembered that I gave the same remedy—kerosene and lard—for chicken mites. In case a hen is brooding chickens this should not be used, as it will injure the young. It should have been used previously so that when the brood come there could be no vermin on the mother hen. In case of neglect insect powder should be used.

* * *

INSTITUTE REPORTS.

It will be remembered that at several of our Farmers' Clubs Institutes, the matter of a full report published for distribution has been discussed and in every case recommended. At the Seaside Institute at Long Beach, the matter was again brought up and a resolution passed urging that measures be taken if at all practicable, to secure such a report. A letter from one of the prominent fruit growers commenting upon recent false reports of institute proceedings emphasizes again very strongly the need of an official report. He rightly suggests that such meaty papers as were presented and discussed at Long Beach are far too valuable not to have wide distribution. He says that no pains should be spared whereby these proceedings, especially of the two annual institutes—Farmers' Clubs' and Seaside—shall be fully and accurately reported and widely distributed.

I have no doubt that many of our readers have received and read with great pleasure and profit the excellent report of the State Horticultural meeting held last spring in Los Angeles Surely if any one were in doubt of the wisdom of such publication, the reading of this splendid report would convince them.

It has generally been urged when this matter was up for discussion that a shorthand reporter be secured and thus a verbatim report be provided for. I do not believe this is wise. I have known it to be tried several times, only to be given up. There is so much taken down that is not worth publishing that the work of editing as well as that of writing out the shorthand notes is alarmingly great, and suggests a different method so strongly that in many cases as I know personally, the shorthand report gives way to a long hand report. This latter, if in competent hands, will be just as valuable as the other and will be made at far less labor and cost. I believe that I have the solution to this problem: Secure some expert in agricultural matters who is a ready reporter to take a long hand report, and carefully write it out in type-written copy. Then submit this to a committee of three to revise before it is offered for publication. I would gladly undertake to be one of the three. If the other two were wisely selected, I believe we might get the entire meat of the meeting in succinct form and at minimum expense, and I believe it would give general satisfaction. I believe we must, in some way, secure such report and such publication, especially of the Seaside and Farmers' Clubs' Institutes.

I have communicated with the authorities at the University and they do not see their way clear to undertake this work. They say, very rightly, that if they make a report of one, they ought to of all the institutes. This is clearly impractical and thus they dismiss the whole matter without action. I shall take pleasure in urging the plan just mapped out before the authorities at the University hoping that they may see some way to accomplish this very desirable and much wished publication. In case I fail, then we must fall back on our clubs. The writer of the above mentioned letter is an esteemed member of one of our most wideawake Farmers' Clubs. He writes that their club will gladly furnish their part of the expense. I have no doubt other clubs will do so if it is found necessary. In the meantime I will cast about hoping to find the right man and some cheap way to carry this program into effect. I shall be very thankful for suggestions from anyone regarding the matter.

GREEN MANURIAL CROP.

The fact that now is the time to sow a green crop for fertilizing the orchard and the tremendous importance of such action, together with a letter of inquiry from Mr. J. H. Bundholt, Los Angeles, leads me again to broach this matter. This is none too early to plant the crop. We must plant to get full growth by February, for by that time we must plow under. I would plant peas. If no more thrifty variety can be secured, then plant Canadian field peas, for they grow very rapidly. Mr. Dreher finds some of the varieties sold in our markets here very thrifty. We have only to remember that we wish a very vigorous variety. Mr. Dreher thinks twenty pounds to the acre the right quantity to plant. He plants three double rows between two rows of trees and put fertilizer a little deeper than the trees are planted between these two rows of each row. He plants them in drills and not very deep. This makes it easy to irrigate in case the rains are not sufficient. This early rain that we are getting now is very favorable to this work. In case peas have not grown before on the same land it will more than pay to go to some garden where peas have been grown continuously and take a little of the soil and sow on to the orchard where we are to put the peas. In this way we secure the needed bacteria and will be sure of a more satisfactory growth. Mr. B. thinks of putting on stable manure before planting the peas. I doubt if this is wise. The peas will give all the humus and nitrogen required and if a little treated bone meal is drilled in as Mr. Dreher recommends this will be all sufficient. I am very glad to note that people are becoming generally interested in this subject. I doubt if any one thing is more important than this.

* * *

CARPET BEETLE AGAIN.

Mr. McA., Carpinteria, sends me some insects that are working on the carpet, wishes to know what they are and asks for a remedy. This is another of the carpet beetle larvae, spoken of last week. It is Anthrenus srophulariae, and is becoming all too common in Southern California. The small larvae can easily be told by anyone, as it is ringed with brown and lighter color and bears long hairs on its body. As I gave quite fully the remedy quite recently I need not refer to that again.

Many a reputation for punctuality rests upon the

California Horticulturally

JOHN ISAAC, SACRAMENTO

A MOVABLE STATE FAIR.

We believe that under the law it is necessary to hold the State Fair annually in Sacramento. The result of this has been to make this annual state show very largely a Sacramento fair, or at least a Northern California institution. It is true that Sacramento, as a rule, is willing to subordinate her interests to her sister counties and that the northern counties do not feel an exclusive owership of it, but still the feeling exists that it belongs to Sacramento. This has a weakening effect upon what might make a most excellent state institution instead of a mere provincial show. At the late fair no county south of San Joaquin was represented. California covers so much territory that it is difficult to get all parts together in a general exhibit, and at the same time it is not to be denied that there is a sectional jealousy that sometimes militates against us doing our best. In view of these facts the law should be so amended as to allow the state fair to be held in different parts of the state in different years or at least to provide for holding it in the north and south alternate years. A movement of this kind we believe would cause the fairs to be vastly more popular than they now are and accomplish the objects for which they were brought into existence. When the State Agricultural Society was first organized the section around and within easy reach of Sacramento was the principal, and almost the only agricultural section of the state, and establishing the State Fair at that point was then the wisest thing that could have been done, but since then the state has grown and Sacramento is now a long way from the agricultural and horticultural center. The annual fair is a good institution and it should represent the whole state and a wider interest should be taken in it.

* * *

THE SLUMP IN WINE GRAPES.

Growers of wine grapes in the northern counties are very much exercised over the depressed condition of the grape market. For several years past there has been a steady advance in the price of wine grapes and there was no good reason to expect a slump this season. There has been no reduction in wine prices and the demand for good California wines show no signs of abatement and the only reason the growers can see for this depression on the part of the wine men is that they have the power and are using it to their own advantage. With the grapes ripe upon the vines and ready for the vintage it is too late for the growers to combine or to provide for working up the crop in their own wineries, and the alternative presented to them is to accept the price offered or lose their crop. The wine makers claim that their cellars and cooperage are now filled to their capacity, and that to handle the very large vintage of the present year will entail a large outlay on their part and this upon an uncertain future market. It is also claimed that the high prices prevailing for grapes for years past have given an enormous stimulus for planting and that when the new vines come into bearing, as many will do next season, there will be a very great overproduction of wine grapes and a very probable lowering in the price for wines, and the winemakers are beginning to hedge, hoping to dispose of the very large stock they are now carrying before the depression comes. Whatever justice there may be in the claims of the winemakers, the putting down of prices will unquestionably have the effect of stopping the extensive planting of wine grapes which has been going on in the San Joaquin and Sacramento valley counties for several years past, and while it may work a hardship at the present, may be the means of preventing the uprooting of hundreds of acres of vines in the future and the ruin of the industry, for there is little question but, if the rate of planting which has prevailed during the past three years, and especially last season, is kept up, the production of wine grapes would soon be so great that they would not pay for the picking.

* * *

PRUNES AND PRUNE PRICES.

The prune curing season is now at its height all over the northern part of the state, and the outlook favors a fair average crop. The Santa Clara section which produces a very large percentage of the total crop will fall below, but outside, the crop is generally up to the normal, while the new acreage coming in will largely compensate for Santa Clara's shortage, although it is probable that he output will be somewhat less than in former years. The prune growers of Santa Clara have declared for 3¼ cents for the four sizes, and whether they get it or not will depend largely upon themselves. The European crop is short and there will be a demand for California's fruit from that quarter, there is no very large carry over stock of last season's prunes on hand, and this year's fruit is exceptionally fine. Altogether there is no reason why the prune men should not receive 3¼ cents for their fruit. Unfortunately, they are disorganized. There is no unity of action among them and speculators may find it easy to break the market.

* * *

GOOD DECIDUOUS FRUIT SEASON.

Deciduous fruit shipments from the northern counties, while considerably in excess of those of last season, have not reached the volume that was anticipated early in the season. As a compensation for this disappointment, however, prices have ruled so much higher that growers will be much better off. Red ink has played a very small part in the fresh fruit transactions this summer, very few cars having been sold that do not return a fair profit, and many have made some very excellent returns to the grower. This favorable report is very largely due to the working together of the growers through the California Fruit Distributors, who have kept in touch with the Eastern market keeping all points well supplied, but carefully avoiding the glutting of any. The results of this season's fresh fruit shipments are another lesson on the advantage of cooperation.

* * *

ABOUT WEEDS.

The Customs authorities at Washington some time since were very much put to it to decide what a currant was. Whether what we call currants were currants or dried grapes. Extensive correspondence was carried on, expert testimony taken, evidence on all sides heard, and finally we believe it was decided that a currant was a dried grape. Now, if a committee was appointed to decide upon what constitutes a weed, they would probably have a much harder task and likely break up in confusion and leave the world more in the dark than ever. Dirt has been defined as "matter out of place," and the same definition may be applied to a weed, that is, "a plant out of place," something for which we have no immediate use, but which, with the perversity inherent in many inanimate things, persists in remaining with us. The same plants are not always weeds. The dandelion of our boyhood, for instance, which, with aching back and sore fingers, we were obliged to weed out of the onion bed, has become a respectable vegetable, while the Lantana, a choice flowering shrub in all our door yards, is such a pesky weed in Hawaii that Prof. Koebele is searching for some destructive insect which will eat it out of existence. Very many cultivated plants, too, when abandoned, become troublesome weeds, as the horehound, which was introduced into San Bernardino in the herb garden of a thrifty old lady in the early fifties, and has since spread all over the state, or the teazle, which was introduced to supply the woolen mills in early days and has since got away and shown its ability to take care of itself and trouble the farmer in some parts of the state. Johnson grass is another example of a plant which was considered beneficial (and is under some conditions), becoming a weed, and this is such a serious pest that the last Legislature passed a law against it, while the man who introduced it is now in the penitentiary—not for introducing it, however. So much for weeds. Now, how shall we get rid of them? I have read all sorts of chemical formulas for killing weeds, but the trouble is these also

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

Woodward's Adjustable Prop Bracket

The Only Bracket That Will Adjust Itself to Any Prop

They are cheaper than any other Prop Bracket that can be made, and will positively not get out of order. No nails or splice to break; no time spent in repairing; can be padded if you wish without nailing. Stand props as near the bottom of trees as possible and they will not be in the way of cultivation If the Bracket is sprung apart so as to go on partway of the Prop it will take a side hold and will never slip. If the Bracket should be too loose press the sides together so as to make a little friction on the sides of Prop and it will stay in place better while being put up.

Having reduced our price to $17 per thousand, we would be pleased to have a continuance of your patronage and can fill all orders promptly.

DECIDUOUS FRUITS

By J. W. MILLS, Ontario, Cal.

AUTHORITY ON FERTILIZERS.

Editor Cultivator: Will you please give me the name of the best standard works on commercial fertilizers, and fertilizing small fruits and truck gardening?—S. H. Lessley, Fortuna, Cal.

We do not think that there is any satisfactory book printed that deals with commercial fertilizers applicable to California conditions. We never heard of any and do not know where the experience has justified such a work. If you want the very latest that has been published on that or any other subject, write to R. Friedlander & Son, 11 Carlstrasse, Berlin, (N. W.), Germany. It is a long way to send after a book, but that firm will have the latest of anything in the book line and you will get returns as soon or sooner than from any other source, and what you get will be what you ask for.

If you want to get a set of good hand books on small fruits and fertilizers, write to Prof. L. H. Bailey, Ithica, N. Y., for his books on "Bush Fruits," and one on "Fertilizers." The two books will cost about $2.50 and they are written from an eastern standpoint. Prof. Bailey also has a book which he may not yet have published but has arranged for, that should be of interest to you. It is "Leguminous Plants and Nitrogen-Gathering," by Prof. E. W. Hilgard.

* * *

A SEEDLING PEACH.

Editor Cultivator: I send you a peach of which I have a number of trees in an orchard that I bought a short time ago. I would like to know what kind of peach it is and what is the best use to make of it. The trees bore very heavy this year and are too small for my trade or would try them. Also, will you please tell me who I shall send samples of soil to to have them analyzed?—N. D. K., Banning.

The peach you sent is evidently a seedling and a very poor one at that. The only thing that you can do with trees that produce such fruit, is to bud or graft them over to some other variety provided the trees are strong and healthy. If they are old or diseased in any way, we would advise you to dig them out. There is not as much profit as we sometimes wish with the best varieties and with the kind you send, there would surely be no profit.

As you are a shipper of fruits, we advise you to graft them over to a good drying peach or shipping plum. Kelsey and Wickson plums do well on peach and they are usually profitable as shippers. Wickson comes in and is gone before Kelsey is ripe enough to ship. The former ripens up well on the road and at the same time develops a good color. Kelsey will not color en route. Good drying peaches are Lovell and Muir.

If you want to have soil analyzed by the agricultural department at Berkeley, drop them a postal card requesting printed directions for taking samples for that purpose. They will be sent to you and by following the directions sent you, you will come out all right.

* * *

ROCK PHOSPHATE.

Editor Cultivator: I have an orange grove at Highgrove, where for the past three winters I have planted and plowed under a green crop, I think a phosphate would be beneficial to the soil and am desirous to learn all possible concerning rock phosphates, where it can be bought and in what condition it comes, if it is drilled in or sown broadcast and also your opinion of it. I would consider it a favor if you would give me all the details obtainable and oblige a subscriber.—A. W., Long Beach.

Phosphate powder or rock phosphate, is the product of the earth and is found in what is known as phosphorite and also apatite, two combinations of minerals. They are ground and sold as fertilizers. There is also a slag phosphate that is a by-product of iron furnaces. This usually goes under the name of Thomas Phosphate. It is a very heavy material, perhaps heavier than sand, bulk for bulk. It comes from the slag or refuse that floats off of molten iron as a scum. This is ground into an impalpable powder and put on the market as a fertilizer. It has been used by careful men as a source of phosphoric acid in fertilizer of orange trees and usually with unsatisfactory results. It has its place though, an dhas given excellent results when used on naturally damp and sour land. In such places, it is much more effective than bone meal or super phosphate that we buy in the market. In such cases, the good results are generally attributed to the form of phosphate, but as slag phosphate contains about 50 per cent. of lime, it would seem that the lime had some effect on soils that are damp and sour and ardent advocates of the material are apt to attribute such effects to the phosphate. On naturally dry soils. Thomas Phosphate has not given very good satisfaction. Superphosphate, that made from bone and sulphuric acid, contains from 12 to 25 per cent. of water soluble phosphoric acid. This gradually becomes reverted to the form of bone we are told by authorities, unless taken up very soon by the plants. Rock and slag phosphate must be taken up by the plants as crude material, the acids that are given off by the root hairs dissolving it as needed. The advantages of the superphosphate over the others, is, that it is soluble in water and is taken down and distributed among the roots and part of it is taken in by the roots immediately while that which is reverted is more evenly distributed and

in a much finer condition than it is possible to place the ground rock or slag. The two latter forms of phosphate can only be disseminated through the soil mechanically, by means of tools, which necessarily means shallow and uneven distribution. There is perhaps a small amount of phosphoric acid that can be assimilated from them, but it has not shown such effects on our Southern California orange groves. As stated above, the case seems to be different with land which is naturally moist and somewhat acid. These conditions no doubt unlock some of the phosphoric acid. The fact that part of the acid contained in the superphosphate (or acid phosphate as it is sometimes called) is reverted back to water insoluble phosphate, would suggest to us that it should be applied in small doses and often as we may think that the trees need it. If we apply 200 pounds of superphosphate per acre and 50 per cent. of it is lost by reversion, there may be some method in applying but half that amount, but if the lime in the soil requires the 100 pounds per acre to become exhausted in reverting the phosphate, then the 200 pounds would be the proper amount to apply. You can see by this, how hard it is to get at the facts and requirements regarding the fertilizing of our soils. We might experiment and work out from results obtained by the crops, a fertilizing scheme that would satisfy curselves on our own land, but the same schedule might be entirely wr[illegible] for land a short distance away. The only iron clad rule for applying fertilizers, must be made up of experiments which prove that certain defects are caused by the lack of certain elements or groups of elements in the soil. There may be numerous manifestations due to the lack of one thing, but until these unsolved problems are worked out, we must confess our inability to give unqualified advice on the subject. Rock phosphate may be bought through any of the fertilizer companies.

ALFALFA FARM FOR SALE—

40 acres, (18 in alfalfa) well improved, three flowing wells with good pumping plant, almost new, with 500 feet of 6-inch irrigating pipe. Windmill with 2,500 gal. tank. VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

GREEN MILK

Editor Cultivator:- I have a cow which seems perfectly healthy, but gives milk of a greenish cast. The milk looks very much like whey and has a rich cream on it. We have been feeding the cow on pears and wheat hay, and turning her out on pasture during the day.

The cow has been milking for six months but the green milk has not appeared until the last three milkings (1½ days). The milk has no lumps in it and the cream looks allright. W. M. K. Willits.

This condition is due to chromogenic or color-producing germs that have in some way gotten access to your milk containers or where the milk is kept. Throughly boil every container and change the place of keeping the milk. Fault is not with the cow.

GARGET

Editor Cultivator:- I have a four year old cow which has one section of udder caked and spoiled. She gives no milk out of that section, but occasionally I can force out puss about the size of a bean, can I do anything to bring it right next calving, which will be the first of December. Please answer through the Cultivator.

A Subscriber.

The probabilities are that the milk secreting power of that quarter is permanently lost.

UMBELICAL HERNIA

Editor Cultivator:- Will you please say through the Cultivator what I should do for a mare colt about six months old that has a soft lump on the seam of the belly about a foot from the bag the size of a goose egg. It came on about a week after she was foaled. It looks something like a rupture. W. J. W. Riverside.

Clipp off the hair and apply strong nitric acid with a glass rod in strips down the enlargement about ½ inch apart taking care not to let the strips cross each other.

WEATHER AND CROPS.

Director McAdie sums up the weather and crop conditions for the past week as follows:

Clear, warm weather prevailed during the week in the interior and cooler weather with fogs and some cloudiness in the coast districts. Light rain fell in San Diego county and on the northwest coast early in the week and heavy rain in the vicinity of Los Angeles on the 27th.

Good progress was made in raisin making, fruit drying and gathering the later varieties of deciduous fruits. Grape picking continues and heavy shipments are being made to markets and wineries. In some sections the early fruits and a large portion of the first crop of raisins have been secured, but in other sections much of the fruit is on the trays and will not be ready for storage for two or three weeks. Grapes in some districts are said to have an unusually high percentage of sugar. Prunes are generally of superior quality, but slightly below average in yield. Apples are abundant and of very good quality.

Bean harvest is progressing rapidly, and in some sections the crop is estimated above that of last year, while other estimates show a short crop. It is too early to give an estimate of the damage to beans by the rain of Sunday, but reports next week will doubtless show some injury. Sugar beet harvest continues; the yield and quality are very satisfactory. Corn and potatoes are yielding good crops. Hops, grain and hay are nearly all secured. In the Los Angeles district rain caused considerable damage to hay, and slight damage to grain, beans and grapes will be largely increased by more rain. Thrashing of a good crop of beans delayed.

We'll Collect That Bill AND NO FEE UNLESS SUCCESSFUL. Collections made the world over. Prompt reports and returns. Look after property and business for non-resident clients. Prove claims. Attend meetings of creditors. Recovery of property and collections are specialties with us. Commercial information and ratings. Write us today.

Riverside Mercantile Agency, Riverside, Cal.

GO TO GARDENA

Do you want a bargain? Do you want to make money and live in a beautiful farming district near street-car lines, 30 minutes from Los Angeles? Then "Go to Gardena," where there is taken an abundance of water from deep wells, ranging from 200 to 260 feet deep, and furnishing from 40 to 150 inches of water (per well) pouring forth an inexhaustible supply of pure soft water, both for irrigating and domestic use.

The soil is rich sandy loam, laying level and well adapted for irrigation. It produces the finest quality of alfalfa, berries and vegetables. The climate is ideal. There is a good class of people, churches, schools, etc.

C. H. SESSIONS, ASSOCIATE EDITOR

THE GREAT POINT OF SUCCESS.

Dairying, like many another business in which men and women engage, to be successful, must be enjoyed by those who engage in it. Unless the owner feels a commendable pride in his cattle and his equipment ,and thoroughly studies the character of his business in all its phases he must ultimately meet with failure in his endeavor.

Not only should the dairyman give attention to the individual characteristics of his cows, seeking to know the peculiarities of each animal, but he should study the best methods to get from his herd collectively the best results possible to obtain.

He can not do this if he does not feel a personal pride in his business. He must keep abreast of the times in all things connected with his work. Read up-to-date papers which give valuable instruction on the best methods of caring for the dairy cow, sanitary regulations and feeding. The reason so many men fail of success in dairying is because they take no interest in their work outside of what they realize from it in a pecuniary way. No business will succeed if conducted in a half-hearted manner, for sooner or later neglected details will bring loss and final bankruptcy.

The successful dairyman is he who loves his work, who takes a pride in it and strives to keep himself so well advised that no detail of his business escapes his notice.

The great point of success in dairying and stock raising is to be in love with everything connected with each branch of the enterprise. When this is the case there is no probability that the enterprise will fail.

We know a stockman who began life with two cows and a pig; today he is quoted as worth $125,000, and he told the writer that his pecuniary success lay in his study of every animal he owned for the first eight or ten years of his business experience. He loved his work, prized his stock, studied the conditions necessary to make his herd healthy and popular, and today he is as much of an enthusiast in cattle raising as he was twenty-five years ago. The great point of success in his case was his enthusiasm in his business.

It has ever been thus in all trades and occupations in life. It will continue to be even more strenuously so as competition increases and demand for the best becomes more general.

A DAIRYMAN'S GOOD INCOME.

The following experience of a successful Wisconsin dairyman was related at the recent meeting of the Guernsey Breeders' Association at Athens, Wis., by H. D. Griswold of West Salem, Wis.

"Choose a herd sire that has a mother and a grandmother and as many more relations as possible that were good milk and butter producers," advised Mr. Griswold. "Get the very best you can. Then get a scale and Babcock test and know what each cow is doing. Cull out the poor ones and keep the best always. Keep up that practice with your heifers. You cannot buy good cows; there is only one way to get them, and that is to raise them. Then comes good feed and plenty of it warm and well lighted stable, and constant, careful care.

"Now to illustrate along this line I will give you a little of my own experience. In 1889 I bought my first Guernsey sire. I had then one Holstein cow, one Jersey and three or four Shorthorns. I find by my books that my total receipts for butter that year were $138.86. In 1891 I got a Babcock tester, the first one that ever came to our town. I found that year that my cows were making 365 pounds of butter each; I then had nine. I increased the number till in 1902 I had twenty-one cows. I have increased the average production per cow to 424 pounds each. I have increased my receipts from $138.86 in 1889 to $1937.43 in 1902.

I now have twenty-five cows, and in the month of May just passed we got 5700 pounds of cream, testing twenty per cent butter fat, with no other feed than grass and a little ensilage. These twenty-five cows are all grade Guernseys but five. I have three Jerseys and two full-blood Guernsey heifers. All but three were raised by myself on the farm and have never been off the place. Six of the twenty-five are two-year-old heifers.

"I tell you this not to boast, but to let you know what we are doing today instead of giving you some has-been tale. We have the same little fifty-acre farm that we had in 1889, but we have built onto the barn four times, have built two silos, and the farm is increasing in productiveness. But you will say it has taken a long time, over ten years. True, but you have to work at something, and dairying is no harder than any other work. The land must be kept up with some kind of stock, and what can you do better? Did you ever think that an income of $2000 on a little farm in the country is better than twice that in the city? Then the boys are interested in the good stock, as they cannot be in scrub stock. And this daily association with these dumb animals makes a man better. He has to anticipate their wants; he has to take lots of steps and do countless little things for their welfare and comfort, and these daily duties make him more thoughtful of others, and he becomes a better husband and father and citizen.

CAUSES AND CURE OF COLIC.

One of the most fruitful causes of colic is the too common habit of allowing horses to partake of large draughts of water immediately after finishing a feed of oats. There is no surer way of generating an attack of colic than this, the reason being that when a large quantity of water is thus imbibed it has the effect of carrying with it out of the stomach and into the intestines some of the freshly eaten grain. This instance, being still in a raw and undigested condition, its effect when it reaches the intestines is to give rise to irritation and inflammation which are the immediate causes of the colic. In dealing with cases of this kind the most obvious course to adopt is to take precautions to prevent the animals from drinking large quantities of water under the circumstances just referred to. When an animal falls a victim to an attack of colic, the best thing to do is to administer a dose consisting of one ounce of laudanum and two ounces of sweet spirits of nitre, along with half a pint of whisky in some hot water.

Very often simple cases of colic yield to the administration of a couple of ounces of cooking soda, diluted with water, and given as soon as the first symptoms of the attack are noticed. Should the administration of this cooking soda fail to give the desired relief, no time should be lost in following it up with the laudanum and spirits of nitre already suggested.—American Stock Farm.

TURPENTINE.

There is no remedy as useful in the management of pigs and hogs an English writer says, as turpentine.

"I have only one remedy for a sick hog, and it is a very simple one. Rheumatism, paralysis, blind staggers, thumps, scours, etc. I treat all alike, though in varying proportions. My cure-all or panacea is nothing more than fresh new milk and turpentine. For a young pig, says six weeks old, I administer a teaspoonful of turpentine in a half pint of milk. Unless the pig is very sick it will readily drink this. If too far gone to drink it must be administered with a spoon. An older pig, however will seldom refuse new milk, even when a tablespoonful of turpentine is given in a quart or more. I always keep a supply of turpentine on hand, and when there is anything wrong with the pigs at once give a dose of turpentine and new milk. It is the best remedy I know of for all the ills that pigs are heir to. Grade the dose from a teaspoonful for six weeks old, to a tablespoonful or more for a mature hog. The milk may be given ad libitum, or as much as the pig will take to drink freely."—Swine Breeders' Journal.

Attend to the feed of the work horses just as carefully as to the meals of their drivers.

In selecting a dairy calf, look for dairy points, and find out about its ancestry, and learn if the calf was started right with the intention of developing it along dairy lines. Unless this is done the calf will be a disappointment.

FEEDING AGAINST SCOURS.

Scours in little pigs is, perhaps, one of the most frequent ailments that they are liable to. If it is let run until chronic it is hard to cure, and very much lessens the chance of the animal becoming a good one. There has been so much said and written on the subject, it seems superfluous to add anything more, but pigs are subject to scours. "An ounce of prevention is worth a pound of cure." Be sure of the cause that produces scours and then remove that cause as soon as it makes its appearance. This usually will check it without any trouble and little injury to the pigs, except a temporary check in their growth.

I feed to avoid the cause and it has proven a sure preventive. We read a great deal about the quantity of milk remaining in the sow's udder. If this were true very few litters of pigs would be three days old before they would have the scours. If the sow is in fair condition at farrowing time she will have more milk than her pigs will take for the first few days. I am very confident that it is the quality and not the quantity of milk that causes scours. Some one will says that if there is too much milk it affects the quality when the udder is only partly emptied at each meal. This is not necessarily the case, but only so when the digestive organs of the sows have been overtaxed, causing the stomach to only partly digest her food, and thus the milk is not right or in normal condition, thus affecting the stomachs of her pigs. This, in the sow, may be caused by feeding highly concentrated foods, or from sudden changes from light to heavy food, from dry food to slop made of rich feed or from sweet feed to sour slop, suddenly. I do not think that either rich or sour feed, if fed gradually, is the cause directly of scours, yet the manner of the feeding at the beginning of the change is very often the cause and the more radical the change in the feed the greater the shock to the digestive organs of the sow, causing a like effect on her pigs, which influence is less and less as the pig begins to eat for himself.

In changing from one kind of feed to another it should be by a gradual process. Many careful feeders improperly make changes from one feed to the next which is too sudden, and the system of the sow is not prepared for the change and the food is only partially digested. The sow should be fed lightly for the first few days after farrowing, as the system is weak and not in condition to digest strong feed. I have found bran or oat meal (ground oats) a very good feed, and the quantity should be gauged according to the condition of the sow and her litter, until the sow is fully recovered, when she can be gradually placed on a full ration, adding more concentrated feed to supply the growing demand of her litter. As long as the pigs are doing well, while their dam has only light, bulky feed, do not be over anxious to change the quality, but the quantity should be increased until she has at each meal all she will eat up clean, and then a little stronger feed can be aded, which, if care be taken, will act as an appetizer, and when pigs will show the effect of increased nourishment by smoothing and rounding out. If you have plenty of milk for the first few days give the sow her slop, mixed with part milk, gradually increasing the milk, and, if you change from sweet to sour, the change should be done very slowly and gradually.

No set rule can be given. A poor milker, or a sow with a small litter. can be put on full feed sooner than a good milker, or a sow with a small litter. There are a great many remedies that may be fed the sow with good results and to soothe or allay the irritation of the digestive organs, I have found tea from white oak bark to mix in the slop, a very good, home-made, inexpensive remedy. It soothes the stomach, acts as an astringent, while it does not affect the feed, lige copperas, mixed with the slop. I think the fast has as much to do with the checking of the scours as the merits of the medicine. Feed regularly and systematically with the directions as to changing the feed and you will not have much trouble and be successful in raising good pigs.—R. E. Rutter, in American Swineherd.

GOVERNOR PARDEE AT THE IRRIGATION CONVENTION.

Governor Pardee is fully abreast of the times in all matters pertaining to the welfare of the state over which he has been chosen to preside. He is thoroughly well posted on all the work of the departments and keeps them under his eye and in matters of importance gives them his personal attention. One of the great features of our state and one that becomes more and more important as time passes, and population increases, is our irrigation system. At the present time there is no non-irrigable land available, and very little open to settlement upon which water can be had except at a cost to the individual, which practically bars him from attempting to bring the two together. Yet there are thousands of acres of the finest land on earth open for settlement and capable of producing unlimited wealth, could water be placed upon it. At the same time, there are rivers of water running to waste that could they be turned upon these arid tracts would cause them to yield without stint and make happy homes for tens and hundreds of thousands more people than we have now. How to accomplish this great feat is the question. The process is an enormously costly one and no individual or combination of individuals can compass it. If it is left for a giant combination of capital to get the water and put it on the land, it practically enslaves the landowner, puts him under the control of the water corporation and makes him a tenant at will of the water ower. The state or the general government should own and control the gigantic water works that will be necessary in the future to reclaim the arid lands of the Pacific Coast, and the land owner should have the assurance of an ample supply at the cost of maintenance, a light tax upon him, while the corporation policy of all the traffic will bear would crush him out of existence or reduce him to a condition of practical serfage. No one appreciates the great future of irrigation in our state better than Governor Pardee, no one better knows the difficulties and dangers that threaten the system, and on one is more competent to handle the subject. It is in view of all this that the Governor attended the Irrigation Convention lately held at Ogden, where his presence and labors had great influence and will do much toward shaping future legislation in the interests of the California irrigators and will have an influence on our destinies that will be felt for all time.

We have the best thing yet for preserving fence posts and all timbers under water or under ground, also for all iron roofing and pipe. If you will take sound, dry posts and properly coat with our preparation the part that is to be in the ground, the fence will stand up long after you are laid out. We manufacture the preparation (protected by patent) and ship in amounts required. One hundred pounds is enough for fifty posts. Any man can do the work. You melt up the mixture in a kettle, heat it to boiling point, keep it stirred and apply with a brush, if your kettle is not deep enough for dipping. Full directions sent with every shipment. The posts are ready for use as soon as the coating cools. The process is cheap and absolutely effective. Write for prices and particulars. We want an agent in every county.

Coulson's Egg and Feather Food

Makes Hens Lay, Keeps Hens Strong and Healthy, Makes Feathers Grow. It costs a little more to begin with, but it is a richer and more nutritious food and is the cheapest in the end. Do not neglect to feed this food during the moulting season.

COULSON'S EGG AND FEATHER PRODUCING FOOD

Is especially prepared to feed to moulting fowls, and it contains all the elements necessary to make the feathers grow, Coulson's Egg and Feather Food is not a fattening food, but a food that makes muscle, bone and feathers. A hen may be extremely fat and yet not have the vitality to stand the strain of growing new feathers, and many hens die during the moulting process. If you want your hens to complete the moulting process quickly, and to have a beautiful, glossy plumage, just feed them all they want—a full meal at least once a day (and sometimes twice a day)—of Coulson's Balanced Ration Egg and Feather Producing Food.

One man says that this year he has been feeding his hens Coulson's Egg Food and the hens have laid more eggs than ever before. Another man who has been feeding Coulson's Egg Food for a year says that it makes the hens lay over the fence and lay everywhere, and you can gather the eggs by the basketful wherever you go. It's good for laying hens, it's good for the molting hens, it's good for the growing pullets.

THE ULTILITY FOWL

What do we mean when we speak of the utility or general purpose fowl of today?

I mean a fowl which will not only lay a large number of good sized eggs, but one that will also make a good broiler, or roaster. A fowl that will sell well as market poultry besides filling the egg basket.

It is hard to find all the good points in one variety or breed, but the utility fowl of the day is undoubtly one of the American breeds. This has not only been proved in our own country, but the European breeders are also coming over here for American fowls. I know this, as I have already made four shipments of white Plymouth Rocks to New Zealand. And am receiving inquiries from British Columbia and the South Sea islands, and have this week shipped a trio of birds to Manila to a government official who intends to try to improve the native breed.

The American breeds are justly popular. They have been made by the very careful crossing of other or foreign breeds; for example, the well known and most popular breed, the barred Plymouth Rock, is the result of a cross between a Dominique male and a black Cochin female. The offspring of this was crossed with a gray Chittagong (or wild Indian game), cockrel and from these originated the Plymouth Rocks. These have been carefully mated and bred for about forty-four years, each year more care being taken to bring them up to standard requirements. The three varieties of Plymouth Rocks, the barred, white, and buff, take the lead and rightly so in the American class, closely followed by the Wyandottes, and the Rhode Island Reds. These breeds are the utility fowl of America. For the profitable sale of the surplus cockrels a fowl that "dresses" well is the best and quickest seller, with yellow skin and legs, and an absence of colored pin feathers, a plump meaty carcass that the most fastidious trade eagerly buys, here is where our big profits come in. In my opinion the American breeds are not only the utility fowls but the money makers.

However, there are many other highly commendable breeds and I think the best breed for any one to choose is the one he likes best.

The Mediterranean fowls are excellent layers of pure white eggs.

The French Houdan's lay a pure white rather round shaped egg and are excellent table fowl, the Crevecoeurs also.

The English Dorking are celebrated for their table qualities, the game, the Orpingtons, &c. The Hamburgs for layers of small delicate eggs, and last, but not least the Asiatics. I confess that woman-like I have tried all these breeds at various times, always buying the best and breeding winners, but when it came to a matter of making money at it, I settled on the White Plymouth Rocks as the breed for my purpose. Still I would say, choose your breed, which ever one you fancy, and then study that breed, learn to know all about it, study each fowl, make it your friend, and soon collectively they will pay you with plenty of eggs and an abundance of chickens.

The different breeds require different feeding and care, and as a rule in writing about the feed and care required it will be for the American breeds, as those are the breeds for America.

ANSWERS TO CORRESPONDENTS.

A letter from Mrs. C. S. K., too long for publication, asks. Why don't some one tell about turkeys, how to raise them, etc.? Full directions were given in the Cultivator early last spring at turkey breeding season. It is too late to raise turkeys now. Another correspondent says tell about geese, what care do they require? This also was described and will be again in the early spring, if I wrote about it now, it would be forgotten then. Gesse begin to lay on Candlemas day—An old English rhyme has it "Candlemas day"

Half the wood and half the hay
The geese and ducks begin to lay.
Candlemas day is February second.

Third. Tell about Indian Runner Ducks, their ways and care, also the Pekin, when do they lay, are they good for feather use?

Answers to these questions are fully given in the Cultivator of March 20th.

* * *

Another correspondent writes: "This is my first year in the chicken business, had very good success until about a month ago, when I discovered that some of my pullets were coughing, and I noticed that the eyes were red and swollen, also a mucus discharging from nose. I doctored for roup, using Mrs. Basley's remedies as given in Cultivator and many other remedies, all without any degree of success. I have lost over fifty up to this writing. Could you offer any suggestions or tell me of a remedy that will effect a cure? Answer through Cultivator."—A Subscriber.

The symptoms you describe are those of roup. I cannot tell you, not knowing the circumstances, how your fowls took cold or became affected with it. You, yourself, must find the cause, remove it, then apply the remedies given in the Cultivator. There is very little use in trying the remedies if the cause is still there and aggravating the disease. The causes usually are, first, a draught of air through a very narrow crack or knothole, or keyhole. It may be but one pullet will have it, her neighbor on the roost will take it from her, then lice for roupy chickens invariably have lice. It will go from one to another, it will also be carried in drinking water and in a few days the whole flock will be infected. It is very infections. It usually begins with a cold and prevention is far easier than cure. My advice would be to keep on using the cures, move those that are well into a clean fresh house, disinfect all your houses, and give to all your fowls blue stone in the water for a month, or you can alternate the bluestone with sulphate of iron, put a piece the size of a bean in a quart of water. Kill those that are the worst and you may save half the rest

I know this must sound very discouraging to you, but it is what we all go through the first year, until we learn to notice the little things. At the first little sign of a cold pick up that pullet, doctor her, put her in the hospital then go down on hands and knees and crawl around your hennery till you find the crack and stop it up. I did it, found a tiny hole drilled by chicken thieves, who were driven away by my dogs, but I lost my beautiful "White Prince" from cold he took sitting in front of that little forgotten hole. The chicken business is made up of little things and easily ruined by little things. Little lice, little mites, little cracks. Your chickens have lice, the lice go to the eyes to drink and carry the germs. If you water your fowls by a stream flowing from one pen to another that is a patent way of carrying infection. I know a man who lost three thousand fowls in this way. Yours may have been infected by the neighbors fowls or you may have brought in new

fowls that developed it and infected yours. Plough up your poultry yards and sow grain to renew the soil, and use disinfectants, and the roup cure, and keep up your courage.

A reader asks "Will you kindly answer the following through the columns of the Cultivator? I want to know if you can tell me of any one who is making a commercial success of raising White Plymouth Rocks in this part of the country? I know that your ranch is successful, but I want to handle commercial poultry myself and want to know what the White Rocks will do for me in that way, as I am a great admirer of their beauty.—A Constant Reader, Long Beach.

Two and a half years ago Mrs. Rhoda E. Durfee of 112 West Fourth street, Santa Ana, bought a pen of me. In five months she had received money enough for eggs sold to pay for the fowls besides having all the eggs she required for the family and twenty-eight chickens besides.

She asked me to mate up her pens last January. I went to see her last week, saw her egg record book. Her sixteen hens laid from the first of January to the first of September two thousand four hundred eggs—or an average of a hundred and fifty eggs per hen for eight months. She is making a commercial success of it, and any one keeping White Rocks as clean and healthy as Mrs. Durfee does will be sure to succeed commercially.

There are others I could mention, if you wish for more names please let me have your name and address.

A well bred hen must be well fed to do her best.

It costs no more to feed pure breds than scrubs.

A hen that has its growth is very easily fattened.

Keep a dusting box where the fowls can get at it handily.

With poultry as with all other stock the best is the cheapest.

PASADENA FARMERS' CLUB.

This valuable organization met on the 24th of September at the home of Mr. and Mrs. F. A. Gould, for the purpose of arranging a programme and electing officers for the coming year. The following officers were elected: Mr. S. O. Bowen, president; Mr. J. C. Knight, vice-president; Mr. Joseph Thorndike, secretary-treasurer. Mr. Bowen has had many years' experience as a State horticultural officer in Connecticut; Mr. Knight is one of the most widely known ranchers of La Canada, and Mr. Thorndike has served the club as secretary-treasurer since its organization five years ago.

Owing to the limit of time but one paper was presented. This was by W. S. Way, whose valuable paper discussed the new bird law.

Mr. Way is an enthusiast on the subject of birds and their value to the farmers and orchardists of California. In this paper he showed the necessity of cultivating birds as well as crops.

He brought out the fact that the meadow-lark and dove are most useful birds to the farmer, that the lark's food consists of 90 per cent. of insects and 10 per cent. of weed seeds, and the dove's food consists of 70 per cent. of weed seeds and 30 per cent. of sbarrated grain.

He advised the club to obtain the following publications, which would be sent free by T. S. Palmer, head of the Biological Department at Washington, D. C.

"Common Birds to Agriculture."

"How Birds Affect the Orchard."

"Foods of Nestling Birds."

"Audubon Societies in Relation to the Farmer."

The Messrs. Stone treated all to some very fine music.

A few minutes were spent in open discussion of how farming papers can be made more useful to the farmers.

REST.

The farmer sits beneath the trees—
His work is over for the day.
Across the long, low meadow leas
The fragrance of the new-mown hay
Comes sweetly to him on the breeze.

Across the upland pastures dim
He hears the bluebirds softly call,
While underneath the osiers trim
The brook speaks louder at its fall.

His muscles rest from healthful toil.
No need to have a scheming brain
To take from others, and the spoil
Add to a false and fleeting gain.

Earth's luxury is before him spread,
Thanks to his might of heart and brain.
No one is loser, but instead,
His toil is his, and others gain.

The farmer nods beneath the trees—
His work is over for the day.
Across the long, low meadow leas
The fragrance of the new-mown hay
Comes sweetly to him on the breeze.
—Henry E. Haydock.

MRS. SALTER'S SPELLS.

Mary Ellen Salter and Henry Beebe had been engaged for three years. The parents of the young people, on both sides, were well pleased with the contemplated alliance, the bride was willing and Henry Beebe's cottage on the adjoining farm was furnished and ready. Only one thing stood in the way of consummating matrimonial intentions, and that was the state of Mrs. Salter's health.

Mrs. Salter's malady was known to the neighbors as "spells", and was, presumedly, from some heart difficulty, though just what form of disorder the doctor, if he knew, kept with professional wisdom to himself. There were vulgarly healthful people who gave the "spells" a sharper, less sympathetic name, and openly declared it a shame the way Mrs. Salter imposed on her husband, who lost so much time running to his wife's bedside that his farm was running down from neglect. As for Mary Ellen, these coldly critical people averred, it was a shame to keep her from getting married, and she with her housekeeping outfit ready these two years. Not every young fellow would be as patient as Henry Bebee. There were plenty of girls ready to step into that new house without waiting.

But Mary Ellen was a dutiful daughter, and dearly as she loved Henry, gently but firmly refused to leave home until her mother's health showed signs of permanent improvement. "Mother just looks like she couldn't stand it to have me leave her while she is so poorly. If she was to die in one of her spells, Henry, and me not there, I could never forgive myself," she said.

Henry Beebe had heard the rumors concerning the exaggerated importance of Mrs. Salter's attacks, but he was too loyal even to mention this to his fiancee. "But we will be so close to your mother, Mary Ellen; I bulit the house on the nearest corner on purpose, though it was twice as hard to get water there. You know I would never hinder you from waiting on your mother. A half-mile is no distance."

Mary Ellen shook her head. "Let us wait until fall. Father's crop will be harvested by that time, and Dr. Harvey thinks mother is apt to grow better in cool weather. Maybe you had bet ter give me up anyway," she added with a pathetic little smile.

Henry Beebe took his sweetheart in his arms. They were standing at the edge of the orchard where they could see the waiting cottage. "There isn't any other girl in the world for me, nor ever could be. I'll wait for you till I'm gray headed, if I have to. No other woman but you is ever going to sit on that front porch, and kep plants in that bay window, and don't you think it for a minute."

Martha Beebe was Henry's maiden aunt, and one of the few who did not wholly believe in the seriousness of Mrs. Salter's illness. Martha had "means" of her own, and was forehanded and thrifty as any farmer in the neighborhood. It was weell known that she was unmarried from choice, for she was a woman of good sense and feeling. One day at a quilting there were the usual covert allusions to Mrs. Salter's peculiar malady. "I'm no doctor," said Martha Beebe, "and don't believe in doctors much, but I'll warrant I could cure Mrs. Salter in one treatment."

"Why, Martha Beebe!" rebuked little Mrs. Burkett, "after she's been doctoring for yeam, and the bottles and bottles of stuff she has taken!"

"That's just the trouble; ;if she'd let that patent stuff alone. The Lord only knows what is in it. I believe Mrs. Salter's ailment is in her head more than her heart, and if I ever get a chance, I'm going to try my remedy, anyway. No, I'm not going to tell what it is," she added with a slight flush, "a doctor don't give his secrets away."

The opportunity came sooner than was expected. While the company were quilting, the hired boy from Salter's rushed in hatless and breathless. "Say, Mr. Salter says can't some of you women come over right away? Mrs. Salter has been took bad, and nobody there but him. Mary Ellen has gone into town," he cried.

Martha and Mrs. Burkett got into the spring wagon and hurried immediately to the afflicted one. They found the patient laid out on the bed, enveloped in quilts from head to foot. Her mouth was limply open, and her eyes seemed fixed on a far away corner of the room. Mr. Salter, the very picture of masculine helplessness, was fanning his wife with a wheezy Japanese fan that was split in two pieces. Martha Beebe took instant charge of affairs.

"We'll look after her now, Mr. Salter," she said, "you had better go out and see about them young heifers; they have broke into the alfalfa, we noticed when we were coming in, and they'll make themselves sick."

She felt under the heavy quilts for Mrs. Salter's heart. To her unpracticed touch there seemed to be nothing abnormal about the beating of that organ. But the sick woman's clothing was wet with perspiration, and Martha laid two of the quilts back. "She's got enough cover on to kill a well woman! But men ain't got any feeling," she added.

Mrs. Burkett looked at her uneasily.

"Oh, she can't hear a thing now," Martha went on confidently, "we could go right on talking about what everybody is saying about her, and she couldn't hear a word. Hand me that fan off the mantelshelf, Mrs. Burkett. Of all fool things! To fan a sick, mebbe a dying woman, with this thing! But it's just like him!"

Mrs. Burkett gasped.

"I think if a man has got a weakly wife, he needn't show he's tired of her so plain that the neighbors talk about it," continued Martha.

There was an almost imperceptible movement of the inert body, and twitching of the wide open, staring eyes.

"Of course," Martha went on, "it would better for everybody if she was to pass away in one of these spells, instead of lingering on, a hindrance and a burden, even to herself. The Widow Bettner would make him a good match, and she is dreadful healthy. My folks have accused me of making up to the widower that is soon to be. You know he used to come to see me before he did her," pointing to the figure on the bed. 'But I tell them its downright unfeeling to talk that way beforehand, though there is no denying that a healthy woman would make a sight of difference in this place."

At that instant there was a miniature earthquake. The quilt enveloped woman sprang up gasping and staggering, flinging the heavy quilts to the floor.

"Oh, you think so, do you? Well, I can tell you now, Martha Beebe, it won't be the Widow Bettner, nor any meachin' old maid either. And I don't believe a word of what you've been saying. My husband isn't tired of me!

Information 248 S. Spring St., Los Angeles
Both Phones 352

He—he—" and Mrs. Salter burst into tumultuous sobs.

Martha was a little frightened at the success of her experiment but she met the attack boldly. "I've done just what I set out to do, Mrs. Salter. I've brought you out of a fit when everybody thought you was insensible, and proved that you wasn't as near dead as you thought you was. Oh, I don't mean to say that you are really pretending to be sick, but you have been deceiving yourself. I ain't denying that you feel bad, and weakly. But you are just giving up to your feelings and sacrificing your family shameful. I'm going to speak my mind about it while I'm at it, and say that the neighbors are saying that it's too bad about Mary Ellen and our Henry. But nobody ain't ever said a word about Mr. Salter, except that he is the patientest and tenderest man that ever lived, with no thought of anybody but his wife.

"But I believe, and there are others that believe, that you could control your feelings, and overcome, to some extent your ailment. A woman that can get up and eat a good meal of victuals right after she has been close to death's door, as you always appear to be, can't be dangerously sick. You ain't the first woman that has given way to hysterics, and thought she had heart disease. Now I have spoke my mind, and I ain't sorry for it. But I'll turn to, and help you straighten up the house if you say so, and Mrs. Burkett and me will never mention what I've said."

Mrs. Salter had, during this tirade, passed from violent weeping to calm, repentant tears. What further passed between the women need not be repeated: It is sufficient to say that Martha succeeded in making her peace, and establishing a tie of friendship which was never broken. When Mary Ellen came home from town, she was startled to find her mother in the kitchen making biscuit for supper.

"Why, mother," she began.

"Yes, Mary Ellen, I reckon you heard that I had another of my spells; but I don't low to have any more. Mirs Beebe, she had some mighty good medicine, and I think I'm going to improve right along now."

Henry Beebe came over that evening as usual, and Mary Ellen met him with a tenderness that more than repaid him for his probation. "We'll go over tomorrow and air the cottage," she said, "and—and we can be married next week if you say so."—Sallie F. Toler.

FRUITS, VEGETABLES VS. MEDICINES.

Diet instead of drugs is becoming a more and more popular method of medication as we become more aware of the beneficial effects of the various plants and fruits on the system, and it is certainly a great deal more agreeable to eat a fine ripe orange or a delicious peach than to take a dose of blue mass or fill our systems with calomel. A late issue of "What to Eat" says that if people understood the medicinal values of foods they would use them more for physical ills and the doctors would have to go to something else for a living. For instance, spinach and dandelion are good for kidney troubles; celery is good for rheumatism, nervous diseases and dyspepsia; lettuce and cucumbers cool the system, and the former is good for insomnia.

If you want to perspire freely to relieve the system from impurities, try asparagus.

There is nothing, medicinally speaking, so useful as the poor and humble onion. They are almost the best nervine known and may be used in coughs, colds and grippe, in consumptions, scurvey and kindred diseases. White onions overcome sleeplessness, while red ones are an excellent diuretic. Eaten every day they soon have a whitening effect on the complexion.

For malaria and erysipelas nothing is better than cranberries.

Fresh carrots and yellow turnips are good for scurvy. Carrots for asthma, watermelon for epilepsy and yellow fever, lemons for feverish thirst in biliousness, low fevers, rheumatism, coughs, colds and liver complaints.

Eggs beaten up raw with sugar are used to clear and strengthen the voice, while with lemon and sugar the beaten white of an egg may be used to relieve hoarseness.—Medical Record.

Don't store eggs in a dark place, as it will often make them musty.

SCOLLOPED POTATOES.

Three cupfuls of finely mashed potatoes, two tablespoons of butter, three of cream, one egg beaten until light, four boiled eggs. While the potatoes are hot beat up with the cream, butter and raw egg, salt and pepper. Put a layer into the bottom of a buttered dish, cover with the slices of cold egg; salt and pepper lightly, then a layer of potatoes and so on until the potatoes are all used having a layer of potatoes on top, wihch sprinkle with cracker crumbs and bits of butter. Bake until heated through and slightly brown.

OYSTER SALAD.

To one large can of cove oysters take one-half a teacup of lipuor from the oysters, one-half a teacup each of vinegar, butter and powdered crackers; yolk of four eggs, and one teaspoon of mustard with salt and pepper to taste. Beat the yolks, add the butter, oyster liquor and crackers, place over the fire and stir constantly until cooked; add the vinegar and mustard and oysters, garnish with hard boiled eggs run through a potato ricer. Make this salad several hours before it is wanted for use.

CARMEL CAKE.

Two eggs, one cup of sugar, one-half cup of butter, one-half cup of milk, one-half teaspoon of soda, one teaspoon of cream of tartar and two cups of flour. You can use baking powder if you prefer it or soda and sour milk. Bake in two layers. Caramel for cake, two cups of sugar, two-thirds cup of milk and butter size of an egg. Boil ten minutes and beat until nearly cold and flavor with vanilla; if you want chocolate caramel grate in two or three spoonfuls of chocolate.

MUCH VIRTUE IN AN ONION.

The idea of an onion cure may not strike the fancy of the aesthetic; however, the experience of those who have tried it is that it works wonders in restoring an cold-racked system to its normal state again. There are three kinds of doses in the onion cure, or three onion cures, as you may choose to put it. One is a diet of onions; the other is onion plasters and the third is onion syrup.

It is claimed by those who believe in the onion cure that a bad cold can be broken up if the patient will stay indoors and feed on a liberal diet of onions. It need not be an exclusive diet, but a liberal one. For instance, an onion-cure breakfast includes a poached egg on toast, three tablespoonfuls of fried onion and a cup of coffee. Luncheon of sandwiches, made of Boston brown bread, buttered and filled with finely chopped raw onions, seasoned with salt and pepper, makes the second meal on the schedule. For supper the onions may be fried as for breakfast and eaten with a chop and a baked potato.

The strange efficiency of onions is well known to the singers of Italy and Spain, who eat them every day to improve the quality of their voices and keep them smooth. Onion plasters are prescribed to break up hard coughs. They are made of fried onions placed between two pieces of old muslin. The plaster is kept quite hot until the patient is snugly in bed, when it is placed on the chest to stay over night. Onion syrup is a dose that can be bought of any druggist and is claimed by some to be unequaled as a cure for a cold in the chest.—Table Talk.

ROOM FOR ANXIETY.

They were newly married, and were spending their honeymoon at a seaside resort.

At the expiration of a week they sent a letter to the old home in which it was written that "the weather was lovely, and that they often indulged in a row in the mornings."

Next day, on returning to lunch after an hour's boating, they found a telegram waiting, which said:

"You say you have had a row. How do you pronounce the last word? Your anious father."—Epworth Herald.

I adore thee, sad September,
With they sere and somber glow,
As they fading, fleeting shadows
Chase each other as they go.
While the Marguerites bedeck thee
And the black-eyed Susans smile,
May I cherish a sweet secret,
As my soul thou dost beguile.

Geese and ducks should not be killed for the market until they are full feathered.

BY ERNEST BRAUNTON, GLENDALE CAL.

OCTOBER VEGETABLE CALENDAR.

During the month you will find all vegetable growers very busy sowing seeds. Near the writer's home our friend John Chinaman, to the number of six, are gardening, and all their work of late has been that of putting seeds in the ground. It is in order to plant the following during October: Beans, cabbage, cauliflower, carrot, lettuce, onions, parsnips, peas, radish and spinach (every month), and turnips.

You will find that it pays to work the ground over very thoroughly several times and get the soil in the best possible condition. Such treatment will save much labor through all the season and goes far toward ensuring a good crop. Some attention should be paid to rotation of crops—do not plant root crops in the same place for two successive seasons or head crops either. Aim to grow a crop above the ground one year and follow it with one beneath the surface.

* * * *

GARDENING FOR OCTOBER.

October is the best month for planting lilies and all those bulbs that are known to gardeners as "Dutch bulbs." These are such as anemones, hyacinths, narcissus, ranunculus and tulips. In planting any of these it will be found best to drop a little sharp sand in the hole before filling in with soil. This method will often prevent rot in case the soil is kept too wet.

It is also just the time to sow hardy annuals and perennials for bedding plants. The list of these is too long to enumerate, but contains all of the old fashioned flowers of your childhood and many more recent introductions. All the common sorts have been much improved during the last few years and you may be surprised to find that the flowers are much "finer than mother used to grow." When once you get a start with this class of plants you may, with little trouble, have a continuous supply for all time.

PROTECTING TREES FROM INJURY BY RABBITS.

Buy some pig or beef livers and rub the bark as high as rabbits bark the trees, and my word for it no rabbit will touch the trees. Of course the remedy must be applied more than once—as after a rain storm. I have tried it in California and know that the rabbits will not infest an orchard that has been treated with "blood" as above. It is a cheap plan and a practical one, as the use of livers does not injure the bark.—Chas. E. Frasher, in Epitomist.

REMEDY FOR PEAR BLIGHT.

Slake eight pounds of fresh lime with hot water, and thin with water so that it can be stirred easily; add two pounds of sulphur and stir it in well. Take five pounds of sulphuric acid and dilute it with two-thirds water with the whole so as to make a heavy, thick white wash. Apply to the body and larger limbs of the trees with a brush. —Jacob Faith in Practical Fruit Grower.

"ITS PENNY WISE"

Policy to set out a good tree, costing good money, and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe avenue, Los Angeles.

Smith (seeing beggar bearing sign reading "Deaf and Dumb"): "I'd like to help this poor fellow, but I don't know how to tell whether he is really deaf and dumb." (Beggar, softly): "Read the sign, mister; read the sign." —Indianapolis Journal.

Highest Efficiency——Most Water

READ TESTIMONIAL

Santee, Cal., Sept. 17, 1903.

The Samson Iron Works, Stockton, Cal.

Gentlemen—I bot. two 4 in. centrifugal pumps off you last spring. I am pumping over the capacity with both of them. One of them I am exceeding the capacity over 33⅓ per cent, pumping about 106 inches, also which we speeded up to 125 inches, causing the manager of a large Los Angeles engine house to say it gave the best results that he had ever seen. Being now a Californian I am certainly glad to be able to commend home manufactures. Very truly, H. D. WILLIAMSON.

San Francisco Markets.

Dairy.

San Francisco, Sept. 30.

The market for fresh lines of butter has been unsettled most of this week owing to light trading in these goods. The prices quoted were:

BUTTER—Per lb:		
Creamery extras	31	@31½
Creamery, good to fancy	28	@30
Dairy extras	25	@26
Dairy choice	21	@24
Store	18	@20
California storage	24	@26
Eastern Creamery	23	@25
CHEESE—Per lb:		
Cal. Creamery, mild new, extra	14	@15
Cal. Creamery, mild new, choice	13½	@14
Young America	14	@15½
Eastern, New York Cream, Cheddars and flats, new	14½	@16

Eggs and Poultry.

No very material change took place in the market for eggs and poultry this week. The demand was normal and the supply was equal to the call on every day except Wednesday, when a slight falling off in receipts raised the price a trifle.

EGGS—Per doz:		
Ranch, selected large	39	
Ranch, good to choice	32½	@38
Store	Nominal	
California storage	25	@28
Eastern	22	@27½

Poultry was in good demand and the offerings of large and fine quality fowls were quickly cleaned up at the maximum quotations, all the week. Fine hens of good size were particularly favored and easily brought the outside figure.

POULTRY—Old Roosters, per doz, $4.50@5.50;; young Roosters, $5@6; Fryers, $4@4.50; Broilers, large, $3.25@4; small, $2.50@3; Hens, 4.50@6; Ducks, per doz., old, $5@6; young, $5@6.

Fruits and Vegetables.

A fairly liberal trade was noticed in the leading varieties of fruits during the week and prices have maintained a steady rate.

Table Grapes met with a good call, but there was no market hardening of values, as supplies generally were up to all requirements. Fancy Blacks and Tokays in crates were held firmly at the top quotations and close clearances were effected. Muscats were in liberal supply and 60c was an extreme for the best offerings. Seedless Grapes commanded a slight premium, as but limited quantity of fancy was available and the demand was brisk. There was an easy undertone apparent in the market for Wine Grapes and the top quotation was an extreme for the highest quality of offerings. The bulk of the day's sales were recorded with $23 as an extreme, and the market closed with liberal quantities offered at this figure. The season for Peaches is now well at an end and market prices are largely nominal. There was a slight improvement noted in values owing to lighter offerings, the market having been relieved of a large quantity of inferior stock that has been carried over for some days past. Trading, however, was slow at the hardened rates. In Pears, winter varieties met with a fair outward movement at sustained prices and the call for the light offerings of Bartlett still on hand was comparatively good, considering the high prices prevailing. Top quality four-tier Apples were picked up freely at the maximum rates, while a depressed tone was apparent in the market for the cheaper quality Fruit, owing to heavy offerings and a sluggish sale. Quinces are held at previous prices and Pomegranates were easier under heavy supplies. Figs were slightly firmer for the better grades, but ordinary Fruit was plentiful and cheap. There was but a slow movement noted in Berries. Raspberries were abundant, and packers secured the bulk of the receipts at the minimum quotation. Strawberries and Huckleberries were freely offered at the old rates, but found few liberal takers. Cranberries were in liberal supply and an active market was reported at the established rates. The market for Limes was closely cleaned up, but as liberal supplies are due on today's steamer the market was easier and dealers anticipated a lower range of prices with the marketing of the fresh consignments. Other Citrus Fruits were without quotable variance and the market for Tropical Fruits was void of any unusual features.

Peaches—Per box, 25@60c; carriers, 40@60c; large open boxes, 50@75c; bulk, per ton, nominal.

Pears—Per box, Bartlett, $1@1.50; other varieties, per box, 40c@$1.

Prunes—Per box or crate, 50@70c.

Figs—Per box, 50c@$1.

Cantaloupes—Per crate, $1@1.75.

Nutmeg Melons—Per box, 40@75c.

Watermelons—Each, 10@20c.

GRAPES—Isabella, 60@70c; large box, 50@85c, as to variety; Wine Grapes, per ton, Zinfandel, $20@25.

Pomegranates—Per box, 40c@$2, as to size of box.

Quinces—Per box, 40@60c.

BERRIES—Per chest: Strawberries, Longworth, $5@8; large varieties, $2@5; Raspberries, $3.50@5; Huckleberries, per lb, 6@8c; Cranberries, per bbl., Cape Cod, $9.

TROPICAL FRUITS—Bananas, per bunch, Hawaiian, $1@1.75.

Limas are now the firmest offering, strong advices from the growing sections holding them in their present position. Liberal offerings of Whites were obtainable yesterday at quotations and orders for colored varieties could have been easily filled at the appearing prcies.

The Chronicle says: "Trading in Potatoes continues purely of a local character and the general market rules weak at easy prices. A heavy accumulation of both Oregon and River Burbanks was received, and although holders were somewhat inclined to force sales by accepting shaded rates Wednesday closed with an easy market and no material reduc-

tion in supplies. Salinas offerings were naturally easy in sympathy, but light supplies prevent any serious depreciations in prices. Sweet Potatoes were in good request at the quoted rate. Onions were as previously quoted and operators reported a slow but steady call. Heavier suplies of most descriptions of Vegetables had a depressing effect upon the market generally, but as there was a fair demand reported prices were not materially lower. Tomatoes were in liberal supply, but between the local trade and the packers the offerings were well cared for at the former range of prices. Summer Squash and Cucumbers were easier and only extra stock brought up to the top rate. Beans met with a good sale and fancy lots were cared for at the top figures.

VEGETABLES—Tomatoes, per box, 25@50c; Green Peppers, per box, Bell, 35@50c; Chile, 30c@40c; String Beans, per lb., 2@3c; Wax, 2½@3½c; Egg Plant, per box, 30@50c; Summer Squash, per box, 35@50c; Cucumbers, per box, 35@50c; Garlic, per lb., 3c; Green Corn, per sack, $1@1.50; crate, $1.25@1.75; Okra, per box, 35@50c; Marrowfat Squash, per ton, $10@12.50.

POTATOES—Per ctl: River Burbanks, 60 @85c; Early Rose, nominal; Salinas Burbanks $1.25@$1.50; Oregon Burbanks, 80@90c; Sweet Potatoes, $1.60.

Dried Fruits, Nuts, Etc.

The market for dried fruits remains firm. interest is still strongly centered in Prunes and available offerings found an active market at the hardened prices. Local brokers were refusing orders for October delivery on a 3c basis, they being busily engaged in filling earlier contracts. A market indifference has developed on the part of growers as to the selling of their product and they are now firm in their demands for full figures. Close clearances of Apricots are effected at the recently improved rates and the market maintained an excellent position for sellers. Peaches ruled firm at the top quotations and offerings of the other leading descriptinos were held wel up to full figures.

Honey is steady at former prices.

RAISINS—Prices by the California Raisin Growers' Asociation on standard brands, 1903 crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.55; Two-Crown London Layers, $1.45; Four-Crown Standard, loose, Muscatels, 7c per lb; do, Three-crown, 6½c; do, Two-Crown, 6¼c; Seedless Muscatels, 5c; Seedles Muscatels, floated, 5¼c; Seedless Standard Sultanas, 5c; Thompson Seedless, standard, 6c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz. per lb., 7¾c; choice, 7½c; fancy, 12 oz. per pkg., 6⅝c; choice, 6¼c; bulk, per lb., fancy, 7½c; choice, 7¼c.

Apples—Evaporated, 5⅝6c; Sun Dried, ——

Apricots—Royal, fancy, 9@9½c; choice, 7½ @8½c; Moorparks, choice, 9@11c.

Peaches—Choice, 5½@6½c; fancy, 7@7½c; peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 2⅞@3c for Santa Clara; other sections, ½c less.

Nectarines—White, 4@5c.

Figs—White, 4½@5c; Black ——

NUTS—Per lb: California almonds, hard shells, 5@6c; soft shells, 8@10c; paper shells, 11@12c; standard 7@8c; Pecans, 11@12c; Peanuts, nominal; Peanuts, Eastern, 5½@6c; do, California, 5@6c; Brazil, 12@13c; Filberts, 11@12c; California Walnuts, soft shells, 12@13c; Hickory, nominal; Chestnuts, Italian, nominal; Cocoanut, $4.50@5 per hundred.

HONEY—New Comb, per lb., White, 12@13c; Light Amber, 11¼@12c; Extracted Water White, 6½c.

Live Stock.

Prices for Hogs were quoted at a fractional decline owing to increased supplies. The market for other kinds of Live Stock was substantially the same as for some time past and familiar prices prevailed.

General trading in Fresh Meats continues of a routine character and as each day's offerings are well absorbed by the current demand the market presents a steady tone at former prics.

BEEF—Ped lb.: No. 1 Steers, 7¼c; do, second quality, 6½@7c; No. 1 heavy, 7@7¼c; thin, 6@6½c; No. 1 Cows and Heifers, 6½c; second quality, 6c; thin, 4@5c.

VEAL—Per lb: Heavy, 7½@8c; light, 9@10c; poor calves, 7@7½c.

MUTTON—Per lb: Light Wethers, 8@8½c; do, Ewes, 7½@8c; heavy Wethers, 8c; Ewes, 7½c.

SPRING LAMB—Per lb, 9@10c.

DRESSED HOGS—Per lb., 8½@9c.

Retail quotations for Meats, as furnished by the San Francisco Retail Butchers'' Protective Association, are as follows:

BEEF—Prime Roast, 15@18c; Porterhouse Steak, 18@22½c; Tenderloin Steak, 15@18c; Sirloin Steak, 12½@15c; Top Round Steak, 12½c; Beef Stew, 10c; Corned Beef, 8@10c; Soup Meat, 4@10c.

MUTTON—Leg, 15c; shoulder, 10@11c; Stew, 8@10c; Prime chops, 12½@20c; Stew, 8@10c.

SPRING LAMB—Chops, 25c; Hindquarter, $1.25@1.50; Forequarter, $1@1.25.

PORK—Loin Roast, 15@18c; Leg Roast, 12½ @14c; Shoulder Roast, 10@12½c; Chops, 15 @18c.

VEAL—Loin Roast, 15@20c; Shoulder Roast, 12½@15c; Chops or Cutlets, 15@20c; Stew, 12½ @15c.

These prices do not cover the cheapest grades, as it is imposible to quote regular prices on them.

Hay and Feed Stuffs.

STRAW—Good to choice, per bale, 45@60c.

FEED CORNMEAL—Choice grades, per ton, $32@33.

HAY—Prices on new Hay, per ton: Wheat, $11@15; Wheat and Oat, $10@13; Oat, $9@12.50; Barley, $8.50@11; Clover, $9@10.50; Alfalfa, $9@11.50; Stock, $8@9.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26@28.

BRAN—Per ton, $22@23.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

CRACKED CORN—Choice quality, per ton, $33@34.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—No. 1 Shipping, per ctl, $1.37½; choice, $1.40; White Milling, good to choice, $1.42@1.51¼.

BARLEY—Choice, No. 1 Feed, $1.11¼@1.12½; off grades, $1.06¼@1.10; Brewing, No. 1, $1.15 @1.20; Chevalier, $$1,25@1.50.

CORN—Good to choice, per ctl: California, new, large Yelow, $1.47@1.50; small do, $1.70 @1.75; White, $1.45@1.50.

RYE—Good to choice, per ctl., $1.25@1.30.

OATS—Good to choice White, $1.20@1.32½; Red, $1.20@1.32½; Black nominal at $1.40@1.50.

BEANS AND SEEDS.

BEANS—Prices per ctl: Large Whites, $2.85 @$3; small do, $3.15@3.25; Pea, $3.25@3.50; Lima, $3.50@3.75; Red, $2.90@3; Pink, $2.00@3; Bayo, $2.70@2.85; Blackeyes, $2.65@2.85; Red Kidneys, $4@4.25.

DRIED PEAS—Green, $1.75@2.

SEEDS—Prices per ctl: Yellow Mustard, $2.50@3; Trieste, $2.75@3.25; Canary, imported, $5.50; Hemp, $3.25@3.50; Flax, $1.75@1.90; Rape, $1.75@2.50; Timothy, $5.75@6.50; Alfalfa nominal.

Hops.

The price for new crop is 22½@25c per lb, according to quality.

Wool.

The Wool market is reported quiet and in an unsatisfactory condition. The strike of the Wool handlers is but partly settled and this with dull Eastern markets is having a depressing effect upon the local trade. The recent sales at Reed Bluff wer surprising, as but few operators believed the offerings would bring the 11@11⅝c figures.

Eastern Markets.

Grain and Produce.

CHICAGO, September 30.—The Wheat market experienced a severe decline during the early part of the week at both Chicago and Nw York, but turned a point on Wednesday and closed as follows: September, 77; old, 77⅛; December, 77⅜@77⅜; old, 77⅜; May, 78⅛ @78¼. Corn—September, 44½; December, 45¼ @45⅜; May, 45⅛. Oats—September, 35¾; October, 35¾; December, 36¼. Rye, September, 54. Flax, cash, Northwestern, 1.01. Timothy, September, 3.05. Clover, cash, 11.25. Barley, cash, 45@60.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	99,700	14,800
Wheat, bushels	118,900	72,200
Corn, "	721,600	660,200
Oats, "	341,700	195,000
Rye, "	30,400	3,400
Barley, "	231,600	29,000

On the Produce Exchange today the butter market was easy; creamery, 13@21; dairy, 14 @19; eggs, steady, 18@19; cheese, firm, 11@12.

Chicago Live Stock.

CHICAGO, Sept. 30.—Cattle—Receipts, 17,000, including 3000 Texans; steady; good to prime steers, 5.25@5.95; poor to medium, 3.75 @4.90; stockers and feeders, 2.25@4.30; cows, 1.40@4.25; heifers, 2.00@4.50; canners, 1.40@2.50; bulls, 2.00@4.50; calves, 3.50@7.50; Texas-fed steers, 2.75@3.75; western steers, 2.85@4.65. Hogs—Receipts today, 20,000; tomorrow, 20,000; steady, easier; mixed and butchers', 5.50@6.30; god to choice heavy, 5.80@6.20; rough heavy, 5.30@5.70; light, 5.75@6.40; bulk of sales, 5.85@6.25. Sheep—Receipts, 30,000; sheep and lambs steady to lower; good to choice wethers, 3.40@4.25; fair to choice mixed, 2.25@4.00; native lambs, 3.50@5.75; western lambs, 4.40@5.35.

California Dried Fruits.

NEW YORK, Sept. 30.—The market for evaporated apples is quiet. The new fruit arriving was of unsatisfactory quality and receives little attention.. There is a moderate jobbing trade in old fruit. Comon are quoted at 4@5; prime at 5¼@5¾; choice at 6@6½; fancy at 6¾@7½. Spot prunes are firmly held and a fair trade is reported at quotations which range from 3¼ to 7c for all grades. Apricots continue firm at 9¼@9½ for choice; 9¾@10¼ for extra choice, and 10½@12 for fancy. Peaches are steady. Choice are quoted at 7¼@7¾ and extra choice at 7¾@8½.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

The auction markets continue to show considerable strength and the past week has seen some additional advance in prices.. A very few extra fancy Valencias in New York reached high figures and the sale of all classes of stock in fair condition brought very satisfactory prices. The Western markets are showing a good demand for the number of cars enroute and some points are calling for more fruit than can be supplied especially in the better grades. The conditions all around are very satisfactory.

The same may be said of the lemon market for 300 sizes; 360s and 420s are much lower in price in New York on foreigns and the demand in the Northern and Western markets are for mostly 300s. The southern markets have taken but a light supply and there is ample stock in 360s and 420s going from California, but the demand cannot be met for the larger size. Shipments have been very light and there are but few lemons in the country to go out in the next couple of weeks. Yesterday's sales in New York showed a strong and somewhat excited market. The total shipment of citrus fruits by cars for the season ending Tuesday were 22,097.

Mr. E. D. Ruffner of Lompoc, Cal., asks if it be true as reported by creamery men here that the creamery men of Los Angeles Co. and other counties in the southern part of the state refuse to receive cream from hand separators and if so, why?

It appears that creamerymen do not care to handle cream from hand separators on account of injuring best quality butter. It is only used in second grades. Experiments have not been satisfactory and therefore not used.

The grape crop in western New York is reported to be less than 40 per cent of a full crop. This is the nearest to a failure that region has ever experienced.

MY CHICKENS

BY

MRS. A. BASLEY

Does poultry raising in California pay? Often I am asked that question and without hesitation I can say, yes.

Some one with a head for statistics has figured that the egg product in the United States amounts to more when measured by dollars and cents than the combined gold and silver production; and that eggs and poultry together are nearly double the value of the gold and silver output. My experiences with the two as sources of income make me believe that his figures are correct, especially if the chicken ranch is in California.

About eight years ago I came to California, the land of sunshine and gold, the land of oil and wine, of milk and honey. A beautiful land with its snow capped mountains, misty velvet hills, dreamy valleys fragrant with orange blossoms and spices.

Intending to live a quiet restful life with roses and palms I built a cottage on an acre and a half of land just outside the limits of Los Angeles, at Prospect Park, near enough to have the advantage of electric car service, far enough away to enjoy the rest and freedom of country life.

A country place is not a country place without chickens. Besides I had always been fond of feathered beauties. I looked about for Standard bred fowls. White Prince, a beautiful White Plymouth Rock had just won the first prize at the Los Angeles poultry show, so I bought him and his harem. All were thoroughbred White Plymouth Rocks—for I believe in heredity.

Observation and experience have both taught me that at least where chickens are concerned blood will tell. Thoroughbred chickens eat no more than common poultry; they grow to be larger, are healthier and handsomer, and they can be counted upon for a greater annual yield of market product.

Gold mining and other investments at this time proving very unprofitable, my income was suddenly reduced and I decided to turn my poultry to account.

My chickens were beauties for I had kept the strain absolutely pure. They were great fluffy white birds with yellow legs and beaks and bright red combs. No wonder people who saw them wished to buy, if not the high price birds, then eggs for a sitting. I was fairly launched in the poultry business.

Poultry business! What a busy life those words represent! The two dozen White Rocks, with which I commenced rapidly increased and I was under the necessity of building more poultry houses and having separate breeding pens. I now have two hundred hundred feet of consecutive houses besides fifteen colony houss, forty feet of brooder houses and out door brooders.

Realizing that in fancy poultry of any kind, shade is necessary for success, the first thing after laying out the pens was to select and plant shade trees. Here I decided that fruit trees would produce the best results, so I fairly crowded the yards with peaches, plums, figs, loquats, quince, pears and walnuts. In each yard I have a water hydrant, and under the trees I keep the iron drinking trough, which is washed out three times a day, the warm water being emptied around the trees, thus keeping the soil moist and loose, benfitting both trees and chickens, for fowls love to wallow in the damp earth under the trees.

The shade of trees in this climate is an essential for the comfort and well being of fowls and the fowls benefit the trees not only by the enrichment of soil from the droppings, but by destroying the insect pests which would otherwise injure both fruit and trees. Also by their continual scratching and digging the ground is kept mellow. No trees in this neighborhood show the marvellous growth and great productiveness of my trees, all due to the care the fowls, and I give them. Trees, fowls and children like to be petted, and the more they are cared for and nourished, trained up in the way they should go, or grow, the richer and finer the fruits, the results.

But to return to my chickens, I had never owned an incubator until I came to California. Grandmother's way of setting hens had been all that I needed "back East." Now that I was fairly launched in the poultry business for profit grandmother's methods were too slow ond out of date, so an incubator was bought, that proving successful the following year another was added. Poultry journals and books were perused and studied by day and night, for the "White Plume Ranch" must and should be a success from the first, and it was.

Brooders and brooder houses were built till there was room enough to accommodate twelve hundred chick-

Chicks and Brooder

Standard prize winning White Rocks

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

In our study of insects thus far, it has been noted that in all except the suborder Neuroptera of the lace wings, we have noticed that the transformations were incomplete. The insects in every stage look much the same so their relationship one to the other could not be mistaken even by the least observant. The bugs or hemiptera, the locust order and the lace wings of the suborder, pseudoneuroptera, all pass through incomplete transformations. All of the other insects, four orders in all—will illustrate complete metamorphoses.

In our last article we gave a general description of the bug. It will be remembered that the metamorphoses were incomplete, the mouth parts modified, that is, they do not bite but suck, and the wings differ from those of all other insects. In the suborder, heteroptera, the front wings are thickened at their base which fact led Linnaeus to give this name to the order. In many of them, however, the wings are all alike and the front wings have no thickened base.

We also took a brief survey of the suborder, Parasitica, which includes the lice, and all of these are wingless. The fact that they prey upon the human form divine makes them peculiarly repulsive.

The suborder, heteroptera or the true bugs are very common and are represented in all parts of our country by several families. These, of course all agree in having the thickened base to the front wing. As suggested in the last article, several families live for the most part in the water. There are some nine or ten families of these water bugs. As we should expect all of them are boat shaped in their form and have their legs more or less broadened, fitting them for oars. One family, the water boatman are very common in our pools, swim in the normal position and have a silvery appearance because they are always covered with a thin layer of air. The insects breathe this air which encases the body and they are thus permitted to rest on the bottom of the pools which they often do. They are, however, usually seen swimming near the surface. They often float upon the surface and by leaping up take wing.

We next have the Backswimmers, which in a general way closely resembles the water boatman, but they differ from these and from all other aquatic insects in that they swim on their backs. They are very quick and when disturbed will dart away like a flash of light. They feed upon other aquatic insects.

Another interesting family is known as the Water Scorpions. In form and general appearance they remind us of the walking sticks of the Orthoptera, but these differ in having wings and of course, they have a beak and suck rather than jaws for biting. These are also insectivorous and like the praying mantis use their front legs to grasp their prey.

I am often asked the name of the great electric light bugs. These have well been called the giant waterbugs. They are among our largest insects, often reaching two inches in length. They are flat and often an inch or more broad. They fly forth when mature, and are attracted by electric lights. An interesting peculiarity of some of these is the fact that the female fastens her eggs on top of her own back. They are glued so that they remain until they are hatched. Some of these are called "toe-biters" by the children. They are very rapacious and not only feed upon insects but other aquatic animals also.

Three families, the creeping water bugs, the toad-shaped bugs and the shore bugs also take to the water kindly, and are nearly as broad as long. So far as I know these are all also predacious. The four remaining families of aquatic bugs are all elongate and most of them are more given to treading upon the water or gliding over its surface. Two of these families are known as water striders and all of us have noticed them walking over the water as freely as though they had solid footing. The first of these have a very broad prothorax and so are some times referred to as the broad-shouldered water striders. The others are much more common and are to be seen almost any summer day, gliding over the surface of any fresh water pool. Their protnorax is narrower than the rest of the thorax and thus they are easy to distinguish from the others. Who has not seen these clustered upon the water and moving around in merry dance as though they were well acquainted with the cotillion. It is said that many of these live in the ocean and are often seen far from shore Both families live upon other insects.

The last family of these water bugs —the marsh treaders—are very slim, and again remind us of the walking sticks. It can also move on the surface of the water and from its small size is not likely to attract attention. Another family, not, however, aquatic, closely resembles the last. They are exceedingly slender and their legs hardly more than threads. Their front legs are fitted for grasping and they resemble the preying mantis even more closely than do the water scorpions, already referred to.

The remaining fifteen or sixteen families of the true bugs are all terrestrial and much alike in a general way, though in form they differ not a little. Some, like the pill bugs, are almost as broad as long; while others are long and slender, and some carry a very narow head with a very long sharp sucking tube, or mouth parts. These bite or, we might better say, pierce cruelly and have often been referred to during the past few years by the name of the kissing bugs. There are several species of these latter bugs, which are likely to cause quite a painful thrust with their sharp mouth parts. Since coming to California, ten years ago, I have personally known of four or five persons being bitten or stung by what we might call bed bugs, had not that name been previously appropriated. That is, they seem to have found their way into beds and there lie in wait for their victims. It is rather strange that they find their way to our couches as they usually live on trees and shrubbery, outside our houses. All of these narrow headed bugs are very predacious, feed wholly upon other insects and thus do us a great deal of good.

There is another curious family of bugs colored much to resemble flowers in which they hide. They have been well called ambush bugs. One of their favorite haunts is the golden rod bloom.. They have very strong front legs, beautifully fashioned for grasping. Although quite small, they are quick and bold enough to grasp an insect as large as the honey bee, from which they are ever ready to suck the blood and life. These are so interesting in this bee-catching habit that I have fully illustrated them in my Beekeepers' Guide.

Another family of bugs might well be called the lace bugs. As their head, prothorax and front wings are beautifully lace-like. They are very small, hardly a fifth of an inch long, but when viewed with a lens, are strikingly beautiful. I have often found them very abundant on our common Yerba santa.

A few years ago we might say that everybody was familiar with the bed bugs. Today because of greater refinement and higher civilization, these most repulsive human parasites are rarely seen. It is not difficult to rid a house and its furniture of these nauseating pests. Bichloride of mercury, or corrosive sublimate is exceedingly repellant to very many insects. Dissolved in alcohol and freely used in and about all cracks where these bed bugs are likely to hide, and we shall soon cease to be troubled with these obnoxious bugs. Lice and ants can be kept at bay by use of this same material. It is always well to remember that corrosive sublimate is a very virulent poison and should always be kept in some safe place in bottles plainly labeled "POISON."

I will mention four families of true bugs, each of which contain species which are terribly destructive. In the family, Capsidae, we have the four lined leaf bug, so called because it is lined on the back with yellow and black. I have known this to do fearful damage on garden shrubs in Michigan. The red-bug family contains the cotton stainer of the south, which is one of the serious pests of the cotton planter. The Coreidae family is represented by the squash bug, well-known because of its destruction to these vegetables in the eastern gardens. But the family most notorious is Lygaeidae. This family contains the celebrated chinch bug, often so alarmingly destructive in the states of the middle west. Though it is very small it often comes in devastating hosts and often lays tribute upon the farmers of Illinois and contiguous states, to the tune of millions of dollars. I have seen the statement that this insect has destroyed fifty million dollars worth of property in the state of Illinois in a single year. It is only about a quarter of an inch long, yet it comes by the millions and the farmer finds it almost impossible to cope with it. It passes the winter as a mature insect and hides under corn stalks and other vegetation. Thus the clearing up of rubbish in winter is found to be helpful. The insect also falls before numerous fungi and Prof. Snow of Kansas has even cultivated fungi in his laboratory with intent to sow them in the field and thus destroy the pests. The false chinch bug, closely resembles true chinch bug, and often does much harm in our own state. I will close this part of our subject with a simple mention of the stink bug family. These insects are usually broad and all who have come in contact with them will recognize the appropriateness of their name. Here belongs the Harleguin cabbage bug, so named from its brilliant markings of black, red, yellow and orange.

The true bugs furnish many very valuable predacious insects aside from the kissing bug family, already referred to. In our next we will discuss the suborder Homoptera, which will be a peculiar interest in our state, as here we find the aphids, the white flies and the notorious scale insects.

SPOTTED FRUIT.

Many inquiries are coming to me regarding spotted fruit. A good many have brought samples. The spots are large and at present very disfiguring. They are found on trees that have been neither sprayed nor fumigated. The cause is obscure. I believe it is caused by some insect, though what the insect may be I cannot tell. It may be that it was the army worm of last spring. We need to be very cautious in this matter, as many biased individuals, prejudiced advocates of either spraying or fumigation, will say it is fumigation or spraying, as the case may be, when in truth it is neither. I am investigating this matter and will give further information as the truth of the matter is developed. It remains to be said that neither fumigation nor spraying if properly done, will spot the fruit to any considerable injury.

I wish to remark again the importance of thorough work in spraying. The orchardist who does not look sharply after his work, if he is having it done in his orchard, is surely not acting wisely. I know of more than one case of spraying done in the last two weeks where examination just after the work was completed showed that the leaves on the inside of the tree were almost entirely dry. Of course such spraying will give little or no satisfaction. Mr. Frank L. Palmer, of North Pomona, who, as it will be remembered, has tents for fumigation, has just purchased a spraying machine. This after an extensive experience the past year in spraying. As I have often recommended, I believe this an exceedingly wise course. If a man owns his own machine and does his own work, the work will be certain to be well done.

* * *

BULBS AND FULLER'S ROSE BEETLE.

Miss Elizabeth A. Ward, Carpinteria has totally lost her strawberries by the attack of the grub of Fuller's Rose Bettle. She asks if it would be safe to plant bulbs on the site of the old strawberry bed. I believe it would. The beetles are all now in the mature state, that is, the grubs have all developed. So far as we know, they lay their eggs only on rosaceous plants. Therefore we have no reason to expect that the eggs would be laid on bulbous plants. The grubs have been found working on chrysanthemums and so we cannot positively affirm that they will refuse to attack any plant, yet we have no reason to expect that bulbous plants would suffer.

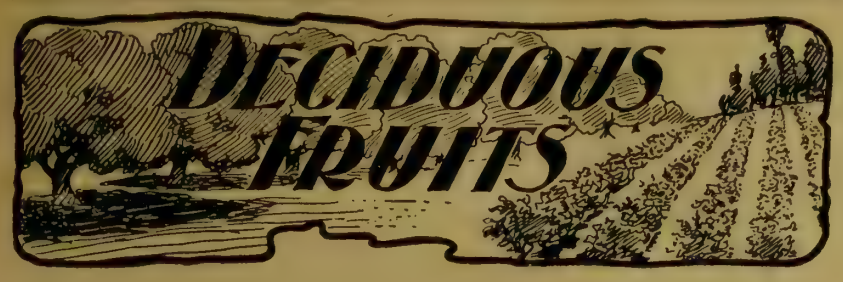
* * *

OAK TREE BORERS.

Mrs. Beatrice Rodgers of Santa Barbara has magnificent live oaks upon her place. These trees are suffering not a little from borers, which are working seriously in both limbs and trunk. The boring grubs penetrate deeply into the wood and from these tunnels, the sap flows so as to discolor the bark, which soon becomes more or less decomposed. Mrs. Rodgers wishes to know what this insect is, what the probable effect will be upon the trees, and if there is any remedy.

It is always dangerous to diagnose such a case without having seen the work and the insect. I have little doubt however, but that it is one of the long horned borers, a species of Elaphidion. These borers are very hard to combat. Washing trees with soft soap will prevent egg laying, but this is obviously impracticable in such cases, as that mentioned by Mrs. Rodgers. So far as I know, there is no way to successfully combat this evil. From the size of the trees however, I should hardly expect any very serious damage, though such disturbance is certainly not to be desired. I should be very grateful to hear from anyone who has had experience with these insects and especially to know of any experiments that have been tried to overcome the evil.

There are being built in Indiana and France airships, which mechanics of reputation say will be ready for use by the time the great St. Louis fair is opened next spring; that these ships will be so complete and so safe that they will be in common use by tourists visiting the Exposition. We are surely coming to it. After electricity, air, then we can skim the sky as now beneath the trolley the car glides over the earth.



J. W. MILLS, ONTARIO, CAL.

ANAHEIM DISEASE.

Editor Cultivator:—Will you please tell me what to do with my grape vines, diseased like this? This has been in the vineyard for twelve or fifteen years. It spreads very slowly and takes several years to kill a vine. —E. A. Hartstock, Healdsburg.

The specimen of grape vine that you send is very much dried up, but the stem and parts of the leaves have unmistakable signs of the Anaheim disease that has always remained a mystery. We cannot give you any remedy for it, nor can we refer you to anybody who can.

* * * *

PICKING PEARMAIN APPLES.

Editor Cultivator:—Would you kindly inform me what would be the best time to pick white winter pearmain apples for winter use and oblige a subscriber.—Subscriber, San Luis Obispo.

It is time to pick those apples now. There will be a part of the crop that will not be ripe at this time, and they can be left on the tree until they develop a little more. In a few weeks they will make better apples than those which ripen earlier in the season. An excellent way to keep a few boxes for home use is to pack them in cool dry sand so that they do not touch each other, and put them in the barn or some cool outbuilding in a cool place. We have seen apples taken out of the sand after having been kept that way until spring when they were as plump and juicy as when taken off the trees.

* * * *

INOCULATING PEA SEED.

Editor Cultivator:—I am thinking of planting peas for fertilizer and would like to know how much earth from land that has grown peas would be necessary to put on land that has never had peas on. Peas have been grown immediately across the road from my place. I intend planting about October 7th after irrigating and cultivating. Will that be soon enough?—J. C. Smith, Ontario.

It will not be necessary for you to use the soil by spreading it over the land. Take about a peck of soil one foot below the surface from the field in which the peas have grown and put enough water with it so that when it is drained off, it will wet the peas. If we were going to plant peas, we would soak them over night and sow them the next day. If you plant the dry seed, you will get a very uneven stand unless a good rain follows the seeding. We know of a case where dry seed did not come up on the sunny sides of the rows until those on the shady side had a good start. Our experience with planting seeds for green manuring crops has been a better crop and a more even stand when the seed was soaked over night. If the seed is to be sown early in the morning, the surplus moisture may be removed by sifting a little dry sand through it with a screen. Be sure to sift the sand first so that stones and coarse sand will not remain with the seed. This part of the job may be omitted if the seed is to be hand sowed or broadcasted. The drying process need only be employed to keep the seed from sticking to the seeder. If the seed is removed from the water early in the morning and sowed in the afternoon, it will be dry enough without sanding. To have obtained the best results, your peas should have been sown a month or more ago.

* * * *

CANAIGRE AGAIN.

Editor Cultivator:—I am seeking some crop that may have profit in it on a small ranch. Fruit here is a failure and grain on a five-acre ranch does not pay much. I have read for years about canaigre, the tannin plant and am creditably informed that you have experimented with it. I would like to know firstly, what is its profitableness; secondly, about the method of culture. Where the seed can be procured; how much seed is required to sow an acre and what is the price. I have read that it belongs to the dock family and if this is true it should be hardy. If you have the seed, please quote prices for several acres. If the stuff is feasible I will go into it on quite a scale. Please give treatment and preparation for market and where a market can be found.—J. H. Close, Escondido.

Canaigre culture has been out of date in Southern California for some years, and if you want to see the blasted hopes of a moneyed corporation, get off the Santa Fe train at Etawanda and drive out to Rosena on the same road. There you will see a deserted village that grew out of the once famous canaigre plantation at that place. Not a living thing is to be found there now and the expensive equipment for the business is rusting away.

The first specimens of canaigre that we ever saw were grown there, but the whole business died out. We do not know why it died unless it did not pay. We once planted two acres of it on our own account some six or seven years ago and we have never gotten our money back on it yet, and never will unless we can sell the roots to some one who is not posted in the business.

The trouble with raising this plant is, it takes from two to four years to make a crop that will yield a good weight of roots. There does not seem to be a demand for it, and we are sure that you would have trouble in finding a market. Promoters of the industry have argued vehemently that leather tanned with it was of extra fine quality. A wealthy, retired shoe merchant of Los Angeles has told us that leather tanned with canaigre tannin was "dead" and never would compare with leather tanned with some of the old tanning materials. This seems to explain why the canaigre enterprises that we have known have sunken into oblivion.

It takes about 14,000 roots to plant an acre. We can sell you roots to plant 10 acres at $2.50 per thousand but as an advisor would advise you to leave it alone. For a small grower to embark in the business would be worse than folly. You would get better returns in four years if you plant eucalyptus trees. The University of California has published some literature on canaigre. The Arizona station has also published bulletins on the same.

* * * *

EASTERN GRAPES FOR SOUTHERN CALIFORNIA.

We frequently have inquiries as to which are the best varieties of Eastern grapes for Southern California. There are certain sections which seem to be well suited to almost any of them and a large number are particularly fine. Mr. Cadwell of Carpenteria Valley has a small vineyard of Eastern grapes and we can say that we never saw finer ones than those growing on his place. His elevation is something like 400 feet.

At the Pomona Station, we consider Agawam and Lindly the best in a collection of about twenty varieties. The vines bear full crops every year and the color of the fruit is unsurpassed, being a bright red wine color, berries evenly colored all over in the shade and out of it. Agawam has bunches about four inches long and rather compact, though not crowding. Lindley has rather loose bunches about six inches long. Both varieties were loaded from the trunk outward for about two feet. There seems to be a growing demand for this class of grape in this end of the state. The two varieties ripen about the last of August and are gone about the time Concords come in. We frequently have inquiries about Concord, but it does not compare with the two varieties named above. Moore's Diamond is our best white grape of the class and Niagria does well also. Iona is a sweet, tender, dull colored red grape but will not sell with Agawam and Lindly. These two have beauty and quality combined.

* * * *

ALMONDS AND GRAPES FOR CUCAMONGA

Editor Culivator:- I have a place in Cucamonga that I wish to plant to grapes and almonds. Can you give me any advice as to varieties and proportions of varieties to plant? I want late table grapes. Any advice you can give will be gratefully received.—Thos. Gray, Acton.

We would advise you to plant the greater part of your land to grapes. The almond is a late bloomer and is often caught by the late frost. We sometimes have to go without a crop for three years from this cause, but on the average, we find that they pay well. We have also learned that they must have water in abundance if we expect to secure much returns. They not only make a better quality of nut from the crop that is on the trees at the time of irrigation, but they are better able to withstand cold weather while in bloom if they have been well irrigated during the previous summer. Well irrigated during the previous summer means that they must have water enough to keep the trees growing while they are maturing a crop of nuts. During the last two years, our trees have been irrigated about four times during the summer and they have made a growth of from six inches to two feet all over the outer and upper surface of the trees and at the same time matured large crops of fine nuts. Last spring they caried their bloom through severe frosts, 27 and 28 degress, and came out with big loads of nuts. In planting, we suggest the following varieties: Golden State, Languedock, Nonpariel, Ne Plus Ultra should not be planted in large blocks of one variety as cross pollination is an important factor. Languedock is a poor bearer if planted alone but with other varieties it gives regular crops provided late frosts do not kill the fruit or bloom and the trees receive water enough to mature vigorous buds. We should suggest planting in blocks of four rows of a kind, making them run north and south.

The best late table grape for the sandy soil or Cucamonga is perhaps Black Morocco. A variety that we have here under the name of Black Corinth bears enormously in the same kind of soil. Golden Queen is a very prolific white variety that ripens late in October The bunches look very like handsome clusters of Muscats. Cornichon and Flaming Tokay are good late varieties, but they do their best on heavy soil. Perferably one with a red subsoil. Cinsaut is our choicest black table grape but it ripens early in the second period.

It is proposed to acquire Mt. Tamalpais and the surrounding forest of 25,000 acres, and turn them into a national park. A district twelve miles long by two and a half miles wide, is embraced in the proposed reserve. Considerable private property will have to be purchased at a cost of about $300,000

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

Wc call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

CALIMYRNA FIGS

(Genuine Smyrna Fig of Commerce)

The only Fig that is fit for commercial purposes. It has proven a grand success in California, and orchardists should not hesitate to plant liberal acreage. **"The Smyrna Fig at Home and Abroad,"** by Geo. C. Roeding, 87 pages illustrated, sent postpaid, 25c (stamps).

Contracts made now for delivery 1904.

Deciduous, Citrus and Ornamental Trees and Rose Bushes.

Finest and most complete Nursery Catalog published mailed for five cents postage.

RESISTANT GRAPE VINES

Sole agents in the United States for largest Nursery in France growing Resistant Grape Vines. In addition to this we are also large growers of Resistant Grape Vines ourselves. Quotations given on rooted Resistant Grape Vines, grafted to the leading varieties of table and wine Grapes. As we handle in car lots we can make very low prices.

Land and Water

BY A. J. McCLATCHIE, PHOENIX, ARIZ.

EUCALYPTS FOR HOT, DRY REGIONS.

(Continued.)

About their names again.

Before proceeding with the discussion of the above subject, the writer wishes to disclaim all responsibility for the spelling and the capitalization of the Eucalypt names that appeared in the preceding article. The responsibility is with the printer, who took liberties with the plain typewritten copy furnished. The name used in the heading conflicted with what followed in the text, and should have been Eucalypts, not "Eucalyptus". The latter word, as explained in the part that preceded, is the Latin name of the genus, just as Citrus is the Latin name of a genus of fruit trees. Its proper use is principally in giving the botanical names of the various Eucalypts, or, if used in the place of the latter word, is to be given the proper plural form Eucalypti and begun with a capital. We cannot properly say "the eucalyptus," as so frequently appear in American papers, any more than we can properly say "the citrus,' in speaking of orange or lemon trees. In Australia, the home of these trees, as well as in most parts of the world into which they have been introduced, the terms Eucalypt and Eucalypts are used almost exclusively, and there is every reason why these brief convenient names should be the ones used exclusively in America.

However, "Eucalyptus" may be properly used as a descriptive word, and we can therefore say "eucalyptus trees" or "eucalyptus wood" just as we say "citrus trees" or "citrus fruits." The names of the species should invariably begin with a small letter, they being only adjectives describing the name of the genus. For example, Eucalyptus rudis means "rough Eucalypt" E. ficifolia means "fig-leaved Eucalypt," E. polyanthema, "many-flowered Eucalypt," E. longifolia, "long-leafed Eucalypt", and so on, just as Citrus trifolia means "three-leaved orange."

One object in writing this series of articles upon Eucalypts is to aid the readers of the Cultivator in getting the nomenclature of these important trees straightened out, and the writer trusts that his undertaking is not going to be defeated by the failure of the printer to follow copy.

* * *

Eucalyptus polyanthema (Red box):—This species endures the trying conditions of hot interior regions even better than does E. rudis recommended in the preceding article. The principal failing that makes it less suited for general and extensive planting is its slower growth. It is uninjured either by the frosts of winter or the heat of summer at Phoenix, where the mercury falls to 18 during the winter and rises to 118 during the summer. It does well in the interior valleys of Southern California, at Fresno, and at Tucson, and therefore may be safely planted anywhere in the Southwest.

As it has denser foliage and makes a more bushy growth than most Eucalypts it makes an excellent shade tree and windbreak. The leaves are permanently broad, being roundish or broadly ovate and of an ashy or dull green hue. As the name indicates, the bloom is profuse, the flowers being small and thickly clustered. The bark is much like that of an ash, being slightly furrowed and grayish in color.

This tree produces a very hard wood that is strong and durable. Besides making an excellent fuel, it is valuable for ties, for posts, and for carriage and implement making. The growth, while somewhat slow, is substantial and the product more valuable than that of many more rapidly growing species. It deserves to be planted much more generally than it has been.

* * *

Eucalyptus rostrata and E. tereticornis (Red Gums):—These two species are among the most valuable ones of all the Eucalypts. They are the true Red Gums, and no others should be called by this name. They resemble one another in some respects, while in other respects they are quite different, there being, however, intermediate forms that are quite difficult to identify. The flower buds of typical specimens of E. rostrata have caps with short abruptly-pinched-off points, while the flower bud caps of typical specimens of E. tereticornis are long and slender. The specific names indicate this difference, rostrata meaning "beaked" and tereticornis meaning "round" or "slender-horned." E. tereticornis usually makes a considerably straighter growth than E. rostrata, the trunks of the former being erect and even in size. Also the bark of E. tereticornis is more inclined to flake off in patches than the bark of E. rostrata, which usually remains smooth and of a brownish color. The seedling and sucker leaves of E. tereticornis are quite broad and large, while those of the other species are slender and rather small in size. The bloom of both is profuse, the flowers of E. tereticornis being the larger.

E. tereticornis grows more rapidly than E. rostrata, under most conditions, and seems to endure most frost and more heat. In Australia it grows in dryer soil than does E. rostrata. Testimony differs as to which furnishes the better timber, the quality evidently varying considerably with the soil in which they grow. But as both are so valuable, planters need not give themselves much trouble to make careful distinction between them. The important point is to be able to distinguish them from other so-called Red Gums. They do not endure quite as much frost as E. rudis and E. polyanthema, but they will grow in most of the interior valleys of the Southwest. E. rostrata does quite well at Needles and at Phoenix, and E. tereticornis does quite well at Phoenix and at Tucson.

The timber of the Red Gums is very hard and durable, making the best of hardwood lumber. Besides being valuable for fuel, for posts, for railway ties and for telephone, trolley, and telegraph poles, when cut into lumber it is adapted to a great variety of the purposes for which hard wood is used. The wood of E. rostrata is a rich red when freshly cut, changing to a darker red or a brown as it seasons. It is consequently well adapted to use for the manufacture of house furnishings and for the inside finishings of dwellings. So numerous are the uses of these trees that they deserve to be and will be planted extensively in the future.

* * *

CURING DATES.

W. M. Scott, Yuma, states that he has this year a small crop of seedling dates for the first time, and wishes "instructions as to the best mode of preparing them for use." All dates are ready for use just as they come from the tree, and most of them, at least many of them, are ready for packing. There seems to be a very general supposition that all dates need curing, just as do figs and grapes; but the fact is that they are sold on the market practically just as they come from the trees. Some varieties contain so much sugar and other solid matter when they are picked that their tendency is to become too hard, unless they are consumed soon or are shipped to a moister climate. Other varieties are of such a consistency that they keep a long time without becoming too dry, or deteriorating in any way. Others that are slightly juicy when they ripen require a brief exposure to the sun before being packed, especially if they ripen during moist weather. A few varieties contain so low a percentage of sugar that they will sour if they are not dried some.

At the Experiment Station we have found the best procedure with dates to be to cover each bunch with a sack of cheese cloth, and then gather the ripened fruit about once in ten days. The sack prevents depredations by birds, and catches any fruit that falls from the bunches. As each tree bears only a few bunches, each weighing ten to thirty pounds, the expense of covering them is very slight. Most varieties will be just about in the right condition to pack just as they come from the sacks. Drier varieties need to be gathered more frequently than the more pulpy ones, to prevent them from becoming too firm before they are packed.

* * *

PROSPECTIVE AGRICULTURE ON THE COLORADO.

From Hydrographer Arthur P. Davis and Professor R. H. Forbes the writer learns that the amount of land proposed to be irrigated through government works, along the Colorado between Needles and Yuma, is approximated at 1,000,000 acres. The water is to be raised to the level of the adjacent land by a series of dams. Professor Forbes, who recently returned from a river trip from Needles to Yuma, finds the climate and soil similar to those of Phoenix. The agricultural and horticultural products will therefore be similar to those of this region. A warmer climate in some parts of the region may, Professor Forbes thinks, make possible the culture of one variety of dates that does not ripen here properly.

This project is one of the many that the Geological Survey is exploiting, and if carried out, will add a large area of productive land to California and Arizona. Somewhat over one-half of the acreage proposed to be irrigated lies on the Arizona side of the river. This would more than double the cultivated land of the territory.

Fuller's Rose Beetle...

Geo. Compere on his return from Honolulu in May, 1899, published in the Cultivator an article calling attention to the destructive work of the Japanese beetle, Adoretus umbrosus, upon the foliage of different trees growing in the Hawaiian islands. To add weight to this note of warning, an illustration of the work of this insect upon the leaves of Eucalyptus robusta and the leaves of the orange, was printed in the Cultivator of the same issue.

We had at that time in Los Angeles county a beetle, the habits of which were but little known excepting to a few of the closer observers. We still have the same beetle but its habits are now known to the great sorrow and financial loss of a vast number of horticulturists. The enormous spread of this insect in the past few years, its feeding habits while in the larval form, and it omnivorous appetite in the full grown stage, warrant the belief that if vigorous and concerted efforts are not promptly made to check the spread of this pest its ravages in the near future will rival, if not eclipse that of the Japanese beetle, against the danger of importing which Compere so earnestly warned us.

This insect is Armigus fulleri. "Fuller's Rose Beetle."

It was so called in honor of the late A. S. Fuller of Montana, who found it feeding upon rose bushes. That it affected other plants has been known for some time. But its widespread attack upon the roots of cultivated plants principally the raspberry and strawberry has been brought to light during the present year by the writer, in an investigation made under the direction of the Horticultural Commission of Los Angeles County.

The insect is described by the Department of Agriculture as follows: "Adult insect from a quarter to three-eights of an inch in length. The color a dark dirty brown, the entire body including the legs, lightly covered with gray or pale-brown scales. On each side of the elytra there is a whitish diagonal line.

The eggs are smooth, soft and of a pale translucent yellow. These in batches of from ten to sixty are secreted by thrusting them between the loose bark and the stem, at the base of the plant just above the ground"

The larvae measures about 8 mm. in length, is milky white in color; destitute of organs of locomotion, and when resting assumes an arched position.

The pupae is about 7 mm. in length and of the same milky white color as the larvae.

The form of this insect generally recognized in this country is the beetle, and its work is manifested by the ragged edges of the leaves where it has been feeding. Within the past ten days the beetles in numbers have been found feeding upon the following plants: Roses, camphor, dahlias, chrysanthemums, orange, lemon, camelias, hibiscus, apple, sterculias, eucalyptus, draccuas, carnations and possibly acacias. In some of the above cases the work of the insect was complete and highly suggestive of its capability under favorable conditions.

These beetles are so long-lived and hardy that it is difficult, if not impossible, to destroy them by the use of ordinary insecticides, at such strength as would be safe to plant life. In such cases as above, perhaps the best remedy will be found in hand picking the smaller shrubs and in jarring the trees over an out-spread sheet to catch the falling beetles In the case of potted draccuas and other plants in the nurseries relief will be found by keeping the plants upon a low trestle the legs of which have been placed in cans filled with water. The insects being wingless and unable to fly over the obstruction will thus be prevented from reaching the plants. In the field nurseries where citrus trees are grown and where this insect often does an immense amount of damage to the young growing buds, a method of prevention that has been found of great practical value, consists of placing a narrow strip of cotton batting around the trunk of the young tree, securing this with a piece of wire and then turning the upper part of the cotton down over the wire. The beetles appear to be unable to pass this barrier on their attempt to ascend the tree.

While the presence of these beetles has been known, and their destructive work a source of annoyance and loss to growers and nurserymen in this region for some time past, their breeding grounds and the extent of the damage done by them during the larval period has not been known and probably never suspected until during the past summer. An extended investigation of the berry fields developed the fact that in almost every location where berries had been grown for over two years in succession, this insect was found feeding upon the roots in more or less large numbers. Blackberries, raspberries and their miscellaneous hybrids belong in common with the roses to the great botanical family Rosacea, and it is possible that the original food plant of this insect may have been the wild berries.

In the fields of raspberries, loganberries and blackberries infested with this pest the effects of its work are not apparent until at least the second year. Unable to bore into the root (as in the case of strawberries) it works upon the tender growing tissue commencing at the tips of the smallest roots and eventually denuding the entire root system, up to the surface of the ground, of every particle of bark and cambium layer. The effect upon the plant is slow but positive. Fruit generally sets in profusion, but development stops about the last of May. The leaves at the tips of the canes are the first to show signs of distress, no wilting, but a gradual drying up, commencing at the edges and soon involving the entire leaf. The tips of the canes quickly follow, the fruit shrivels up, and the entire plant succumbs.

Remedial measures were not attempted in this investigation in the infested raspberry and loganberry fields, but the general methods employed in the strawberry fields should prove applicable in such instances. The larvae and pupae were found most abundant during the month of June, and the general issuance of the beetles took place about the middle of July. Treatment with Carbon-bisulfid would probably be most effective applied in May.

Raspberry vines, especially those of the variety cuthbert often show signs of distress identical (to a superficial view) with those produced by the work of this insect, an investigation below ground will often reveal a more or less aggravated case of root-knot, but no insect, and again an investigation, suggested by the appearance of the leaves and canes, no matter how thorough, will fail to reveal any cause for the disturbance beyond a suspicion of possible cane blight. In case of diseased raspberry, blackberry or loganberry vines the grower should thoroughly investigate the case or else apply for assistance before applying remedies.

In the strawberry fields the work of this insect is very disastrous and from testimony gathered from general sources has been at work in this direction, though unrecorded, for many years. The destruction of the strawberry plants is continuous all summer but the principal attack is apparently confined to the month of May. The method of attack appears to be about as follows: The larvae or grub enters the plant by boring into the stem at a point one and a half or two inches below the surface of the ground, tunneling upward to the crown where it eats out the entire heart of the plant. The effect upon the plant is prompt and positive, the wilting or collapse being sudden and complete in a very short time and can readily be recognized from the effects upon the plant caused by other insects.

In carefully studying the findings of the investigation for the purpose of devising some measures of relief, the fact that the insect in its adult state was wingless or so nearly so as to preclude any attempts at flight, and that the grub was unable to travel but a few feet at most, immediately suggested that the first practical step would be to change the location and take in new land not infested by the insect. However, this is not as practical as it would appear at first thought. Strawberry growers have in a great many instances expended large sums in grading and fertilizing the soil and in perfecting irrigating facilities, and for these other measures of relief must be found.

Prof. T. H. Chittenden of the Department of Agriculture, suggested the burning over of strawberry fields after the harvest of berries for the summer was completed. To attain this end he advised the mowing of the vines allowing the cut foliage to dry, covering the ground lightly with straw and burning with the wind. This appeals to me as an eminently cheap and practical remedy of reaching the beetles that have issued and are at present hiding under the foliage of the plants and debris upon the ground. In this region where irrigation is practical and the roots can be kept moist it should be absolutely safe, and a valuable auxiliary to the treatment in May, with carbon-bisulfid, against the larval-form of the insect. In addition to completing the destruction of the insect in question, it will destroy millions of fungus spores and many other forms of insect life.

In attempting to rid the soil of grubs and pupae in the badly infested fields and thus prepare them for the comparatively safe planting of strawberries next season, recourse was had to the use of carbon-bisulfid. A series of experiments was made with this material using it in different amounts and at different distances, these experiments and the results obtained are incorporated in a report which is now on file in the Horticultural office of this county. Suffice it to say that one-third of an ounce, used at a distance of every lineal eighteen inches in the row was found to be complete and destroyed all insect life down to a depth of eight inches. The cost of material for this treatment was ten cents for seventy-five running feet of row. Used in the early part of June, this will probably be found the most practical method of ridding the infested ground of the larvae, and pupa, of this insect but will not save the infested plants.

In the fields of young strawberry plants a careful watch should be kept during the latter part of the month of April and also May. Whenever a plant is found to wilt suddenly it should be carefully lifted and destroyed. In almost every instance at this season the grub will be found in the plant, In the thousands of plants lifted during the investigation very rarely was more than on grub found in a plant, where the plant was young and lately set. A few drops of carbon-bisulfid may be placed in the hole made by removing the plant and thus insure the death of any grubs that may be left in the soil. Experience has shown that there is no danger to adjoining plants in the row from the use of carbon-bisulfid providing the liquid does not touch the roots.

There is no remedy known to the writer that will save a strawberry plant when once it has been attacked by this grub, but the prompt removal and destruction of the infested plants will save the majority of the new plantings from destruction.

Many and various causes conduce to the death of strawberry plants in the fields, especially of the young plants. Some of these are apparently inexplicable and the grower should carefully investigate the causes as advised in the case of raspberries before applying remedies.

In the gardens, chrysanthemums and carnations are severely attacked by this pest and the sudden wilting and death of any of these plants should be immediately followed by a thorough examination of the roots and surrounding soil. If any grubs pupae or beetles are found, the soil around where each plant was removed should be given a dose of one-half ounce of carbon-bisulfid and left for some time before replanting.

While the most general attack upon the roots of strawberries and raspberries apparently took place in May the insect has been found working in a desultory manner all summer. Wilted plants containing grubs were found from April to September, inclusive, and to keep the new fields clear of this pest will require constant vigilance on the part of the growers.

To sum up, this insect is spreading rapidly and threatens to become one of the most serious pests in this country, and in hopes of arousing an interest in the matter its different habits and the methods employed against them are here recapitulated.

The beetle form—On shrubs and trees.

Hand picking and jarring into outspread sheets.

On potted plants in nurseries.

Keeping plants on low trestle with legs placed in cans filled with water.

On young budded citrus stock in field.

Placing bands of cotton batting around trunk securing it with wire.

The larvae or grub form—On raspberry, loganberry and strawberry roots.

Removal of young plants when first infested. Use of carbon-bisulfid on old badly infested patches, mowing and burning over old fields immediately after the harvesting of the summer crop of berries.

On roses and other flowering plants in the garden, prompt removal and destruction of all dead or infested plants and disinfection of the surrounding soil with carbon-bisulfid.

CUBAN RECIPROCITY PROSPECT.

Much discussion has recently been indulged in among leading politicians and tradesmen as to the outlook for Cuban reciprocity in the next congress. It was thought last month that possibly an extra session of congress would be called to determine the question of ratifying the proposed treaty, and it is assumed that after few days spent in organizing, in maneuvering, and perhaps in filibustering, the legislators will go home for Thanksgiving week without having made any progress with the Cuban business. This will bring them close to the first Monday in December, the date for the first regular session of the Fifty-Eighth Congress—so close, in fact, that it is extremely doubtful whether definite action will be had on the treaty prior to the regular session.

A correspondent of the New York Sun writing on this topic from Washington, under date of September 26, gives it as his opinion that in the very brief space between the end of the Thanksgiving recess and the beginning of the regular session "congress will again tackle the Cuban reciprocity question, which has for many months been a sore disturber of our political peace." It would not, however, be at all strange or unreasonable if the Thanksgiving recess should be prolonged until the first Monday in December. In that event the time spent in the extra session would be time wasted. Should this view of the probabilities commend itself to the mind of the President no extra session is likely to be called, and the Cuban question will be permitted to take its turn in the regular session. Many Senators and Representatives favor this course, and not without good reason.

A bonus of $150,000 paid by trunk-line roads to Chicago packers was the cause of the recent advance in the rates on dressed beef.

FOREIGN PRODUCTS REJECTED.

Information comes from Washington to the effect that twenty cargoes of foods and wines have been rejected by the Department of Agriculture as unfit to be consumed by the people of the United States under the Foreign Food Law which became operative July 1 last. The list of rejected imports includes two cargoes of Sauterne wines, five cargoes of Rhine wines, four cargoes of olive oil, three cargoes of Frankfurter sausages, one cargo of vinegar, one cargo of coloring matter of foods and four cargoes of canned vegetables.

Since the law became operative 205 samples have been taken. Eighteen of these samples are yet to be analyzed; 167 cargoes have been pronounced pure and twenty were rejected as impure. This shows that 10 1-2 per cent. of the foods imported into the United States since July 1 has been found impure and unfit for consumption. They will all be destroyed or returned to the countries from which they were shipped. This will give some of the foreign countries that have been over zealous about investigation of American pork an opportunity to know that the law of reciprocity works all 'round. In this connection is the fact that Secretary Wilson has just appointed Prof. George E. Colby of the University of California as special agent to make analysis of food shipments to California ports.

A PURE FOOD LAW.

The next Congress of the United States will take up the law passed by the last Congress and amend certain parts thereof, with a view, it is said, to establishing a uniform system of labeling products which are not now labeled, or which are only labeled to conform to local laws in certain States.

During the recess, the Department of Agriculture has been engaged in preparing standards for food products in accordance with the law passed by the last Congress. While the government has not the authority to prohibit the sale of adluterated foods, a long forward step is embodied in the law giving to the Secretary of Agriculture the right to fix the standard of purity for foods, drinks, and condiments.

Dr. Wiley, chief chemist of the Department, has been assigned to the duty of fixing standards. He is an advocate of a pure food law, and believes the next congress will enact one. "So far as mere health is concerned," said Dr. Wiley, "the country could get along pretty well without a pure food law, because if a man gets sick from eating something, he finds out what it was that made him ill, and avoids it in the future. Of course, I do not minimize the importance to health or pure food, but the real benefit from such a law would be in the promotion of honesty in trade.

"Some of the States have laws that require a particular kind of label. Hundreds of manufacturers are required to manufacture and carry certain products in many different ways to suit the local laws. A national law would do away with all this annoyance, which is now beneficial to nobody."

California has a law which in some particulars goes a long way toward remedying faults that existed among producers of certain commodities, but it is local in its character, not so effective nor so far reaching as a national law would be. It would be to the interest of the country at large if a national law were passed governing the production of all classes of foods; for by such a measure not only would the manufacturer of adulterated foods be stopped but many poisonous articles now used as preservatives eradicated from use. The country stands much in need of a pure food law with restraining clauses and penalties sufficient to insure its strict observance.

Dr Aladar Navay, Royal Hungarian Agricultural Commissioner in Paris, France, reports to his government that the spring frosts nearly ruined this year's fruit crop in France, that there are few apricots, peaches and plums left over from 1902, hence prices are high. The same is true, to almost the same extent, of pears and apples.

RURAL FREE DELIVERY

The suggestion made by the Post Master General to reduce the appropriation for the Rural Free Delivery does not meet with public favor, no branch of the public service having proven more universally useful and therefore popular. It has revolutionized daily newspaper business, bringing the city paper in touch with the farmer at whose home it comes at a reasonable early hour in the day. It gives him not only the news of the world, but the markets each day, and enables him to judge intelligently what his product is worth before he reaches his local market. So to him the free delivery system is of incalculable benefit. Of course it is an expensive matter to provide the entire country with free mail service but it is now a necessity and the service has come to stay. The Postmaster General's recommendation to reduce the appropriation for this department probably came from the exposures recently made of dihonest officials whose peculations from the goverment were so enormously large as to freighten the post office officials. The estimate for the ensuing year provides for a larger appropriations from congress than has ever before been allowed it. It is expected that the amount will be in the neighborhood of $20,000,000. Last session $12,500,000 was allowed, of which $9,000,000 was for maintenances and the remainder for new service.

Under authorization of congress, there have been established since last July 1390 new routes, and there are 2100 that have been agreed on, and are yet to be put in operation this year. It is expected that by the end of the present fiscal year there will be in all 21,000 routes in operation. The estimate is made that it will take $12,500,000 to operate the routes that will be in existence at the end of the year, and $9,000,000 more will be asked to establish additional routes.

It is not unlikely that congress will appropriate a deficiency allowance amounting to $700,000 or $800,000 to provide for new routes that are put on this year, says the Washington Post. This was the way the rapid establishment of new routes last year was provided for at the last session. Congress appropriating for that purpose $500,000. Notwithstanding the embarrassments of the pending post-office investigation to the rural service, there is no disposition on the part of the president or among the members of congress to allow the system to suffer from what has occurred in the administration of the large appropriations that have been so willingly furnished.

In bulletins Nos. 151, 152 and 153 the California Experiment Station discusses the arsenical insectisides, the correlation of the dose of cyanide to the size of the tree in fumigation, and the use of distillates for spraying. As all of these bulletins can be obtained for the asking we attempt no analysis of their contents. There is evidently a good deal of money wasted by excessive or insufficient use of cyanide in fumigation, as is made evident by the wide variation in practige in the amount used. If those who use least use enough, others waste material. If they do not the work is imperfectly done. The whole subject is discussed in bulletin No. 152. The matter is of interest only to citrus-growers, as deciduous fruit will not bear the cost of fumigation. In regard to the use of distillate sprays the conclusion is reached that two sprayings per annum must be counted on as required to keep citrus trees as free from scale as they will be after one fumigation. If more than two are required the cost will exceed that of fumigation. The question is as to the possibility of always killing the scale without serious injury to the tree or fruit. That is not fully worked out, and further study is required. Distillates do not seem to injure lemons. They do in many cases injure oranges. What has been learned to date is fully discussed in bulletin No. 153.—San Francisco Chronicle.

John Alexander Dowie, of Chicago, is coming to San Francisco to found Zion City.

PRESERVE DEEP WATER FRONT.

The proposition to turn over 2500 feet of water front at San Pedro, to a private party to be used for a private enterprise is monstrously wrong. That harbor belongs to Southern California and is vitally essential to its development. That there should be found in San Pedro, a single man who favors the proposition is beyond belief. If Southern California is ever to attain commercial importance it must have free harbors. Los Angeles is naturally interested in San Pedro and must see to it that its grand harbor is not frittered away in some useless franchise. The Los Angeles Chamber of Commerce has already taken action in the matter, a special committee, after making an investigation of the situation, having adopted the following resolution:

"Resolved, That we would respectfully petition the Board of Trustees of San Pedro that they refuse to grant this lease or any other form of lease or franchise that will alienate any portion of the deep-water frontage now remaining with the City of San Pedro, and we take this occasion to assure the authorities and the people of that city that the commercial interests of Los Angeles and of Southern California are so directly involved in this question of the freedom of the harbor frontage, that the alienation of that frontage must be treated as a matter of more than local importance and one in which the Chamber of Commerce of Los Angeles and other interested bodies should be given the right to be heard."

The Los Angeles Times truly says this resolution truly states, the matter is one of more than local importance—far more. The members of the Old Guard that did such brave work for a free harbor must hold themselves in readiness for further action, and to their ranks should be added all public-spirited newcomers who are interested in the progress and prosperity of Los Angeles and Southern California."

Bulletin No. 154 of the State Experimental Station is devoted to a discussion of sulphur sprays for red spider. The discussion is interesting and of value to orchardists. The use of sulphur as a removal agent for red spider has long been known. It is the common specific for the past years before the present remedies were adopted. Sulphur spray did effective work in cleaning orchards of mites. The sulphur will kill the mites and will not injure the trees. The trouble is to get the sulphur to stay on the trees and do its work. It has been nearly always used dry and been applied when the trees are wet. The sulphur, of course, remains until the trees dry off, when much of it blows away. Efforts have been made to find some satisfactory mixture of sulphur and some agent which would cause it to adhere while not interfering with the effectiveness of the sulphur.

The irrigation problem is the great problem of this age—especially to California. Where water can be procured land is worth gold, where it cannot be produced it is worth simply what it will bring. It is no wonder then that men prominent in the irrigation thought should be pronounced in their views as to the benefit irrigation is, and will be, to this state. The delegation to the Irrigation Congress from this state was made up of the ablest men in that body. It is to the credit of those men that their efforts were exerted in work, not in talk.

Governor Pardee's address at the Irrigation congress was one of the strongest arguments presented to that body. It has attracted general commendation and is being widely quoted in the press of the country.

Farmers' Clubs throughout Southern California are being enthusiastically attended. When interest flagged in any of them it has been quickened and renewed effort is being created all along the line.

The trunk lines of the East are reaching out for Southern California trade. The next great railroad to invade this territory is to be the Gould system. A three days' schedule is promised to St. Louis.

The quail season opens October 15.

The seed crop of Santa Clara county is excellent, except sweet peas.

A Farmers' Institute will be held in Fair Oaks on the 16th and 17th inst.

The open season for ducks begins October 15th. They are plentiful on California inland waters.

There comes a call from the Philippine government for 150 male teachers. The salaries range from $900 to $1200.

One thousand bales of Oregon hops were sold at Portland October 1, at 25 cents. The goods were of prime quality.

Luther Burbank will receive a beautiful gold medal for his exhiblt at the State Fair of new hybrid fruits and flowers.

Watsonville apple growers say they will send apples to be exhibited at the St. Louis World's Fair that will beat the world.

Forty Boer families from South Africa are on their way to America. They will settle in Mexico. Others are to follow.

The fresh fruit shipping season of Solano county, now drawing to a close, was decidedly successful—more so than ever before.

Wheat in Minnesota is now selling at $1.00 per bushel—the hard, red type grain. The Macaroni does not bring so high a price.

Robert, Harry and George Mitchel, who own large copper mines in Mexico, are seeking a location on San Francisco bay for a large smelter.

It is now conceded that the State Fair just closed at Salem, Oregon, was equal to the California fair. Premiums to the amount of $12,800 were paid and the fair closed with $6000 in the treasury.

The green fruit shipping season in Solano county has about closed. The total number of car loads shipped from Vacaville for the season ending September 25, was 1052, as against 779 cars last year.

Prof. Geo. P. Colby, of the State University, the well known chemist, has been appointed by the Secretary of Agriculture to make an examination of food products imported from foreign countries, received on the Pacific Coast.

The city of San Francisco, at a special election held last week, voted to issue twenty millions of bonds to be expended in public improvements. The streets are to be improved, new hospitals and school houses erected, parks established and other improvements made.

A nine-months-old corn-husking dog is the latest thing along the Wabash. It watched its master husk corn one day and then began tearing the husks from the ears as fast as an average farm hand could do it. The next day the dog did several hours' work in the field.—Exchange.

It is expected that 3000 delegates to the National Bankers' Annual Convention will be held here on the 20th inst. The convention will be in session three days. The San Francisco bankers here raised a fund of $35,000 for the entertainment.

For several miles along the coast near Santa Cruz, the beach is strewn with millions of Spanish mackerel from eight to ten inches in length. The cause of the phenomenon is not known. Spanish mackerel are one of the best of the food fishes.

Geo. C. Hussman, U. S. Viticulturist, will at a distant date establish an experimental station for grapes on the Mojave desert. He believes grapes can be made to grow there. He has a theory of his own, but is not yet ready to give it to the public.

W. S. Melick, Secretary of the State Board of Examiners, reports that California has forty-two orphan homes in which are 974 orphans, 4251 half-orphans, 450 abandoned children and 260 foundlings. For the six months ending June 30th these cost the State $189,765.25.

The transport Sherman left San Francisco October 1, carrying $2,000,000 from the mint to the Philippine Islands. The September coinage of the mint of that city was 180,000 double eagles, 465,000 eagles, 108,000 standard dollars, 440,000 half dollars, 41,330 dimes, 2,004,000 pesos.

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

A co-operative winery is to be built at Lodi.

Drouth has injured the North Carolina tobacco crop.

Fresno is to have two hundred miles of electric railway.

The California wine crop is 20 per cent greater this than last year.

The Chico friut company have shipped about 100 carloads of prunes to France and England this season.

Two children of Mr. and Mrs. Joseph Gould, near Woodland, died a few days ago from poison due to eating green almonds.

Baker & Hamilton recently sold a bean thresher to Scatena Brothers, below Sacramento, which threshes and cleans 100 sacks of beans per hour.

The latest reports as to the wheat crop in Minnesota and the Dakotas is that owing to a soaking from heavy rains, the damage is placed at $15,000,000.

The grape growers of the state are dissatisfied with the prices fixed for grapes this year and a movement is on foot to organize a state grape growers' association.

The consumption of coffee in the United States has increased till it is now estimated that we consume a little over twelve pounds of coffee per capita annually.

The prune growers of the Santa Clara valley are still holding out for a three-cent basis. Buyers at this writing are offering two and three-fourths to two and seven-eights cents.

Sixty box mills have been consolidated into one combine under the name of the California Pine Box and Lumber Company. It is capitalized at $5,000,000 and its headquarters will be in San Francisco.

The Woodland cannery has been in operation two years. Its work this year is summarized as follows by its managers. Peaches, 10,000 cases; apricots, 8,000 cases; tomatoes, 20,000 cases; beans, 1000 cases.

Ventura county this year took first rank as a honey producing county. There are in that county 10,000 bee colonies; they produce 1,200,000 pounds or 40 car loads of honey annually. The industry brings into the county $50,000 per year.

The grape shipments from California this year are phenomenal as compared to former years. The grape season will last two or three weeks yet. At this writing the total car loads shipped are 700. Last year only 316 car loads went out.

The Merrit Fruit Company of Santa Rosa is now packing and shipping to foreign markets two carloads of prunes daily. The McDonald Warehouse Company is doing about the same amount of business. The fruit is going to France and Germany.

Major J. P. Harney, general manager of the Sacramento Transportation Company, says the wheat of the valley is now well under cover, and farmers will suffer little or no loss from rain. The steamers will soon begin loading and moving the grain.

Elwood Cooper announces that he expects to have a report read at the Fruit Growers' Convention at Fresno, December 8, from George Compere who is now in Africa looking for a parasite for the fruit fly; also his report on the parasite for the codling moth he found in the south of Europe.

The fruit crop of Great Britain was very poor this year, hence the fine market there for American fruits. California is sending John Bull more fruits than ever before—pears and plums especially. The following are the quotations from London at this writing, per box: California pears, $1.94 to $2.30; California plums, $2.43 to $2.91; Bartlett pears, $1.82 to $2.30; peaches, $2.43 to $2.67.

California is to have six Government stations for testing the possibilities of the grape. So far Viticulturist Hussman has decided on four places, viz: Oakville, in Napa county; Mountain View, Livermore and Fresno. He will collect grape vines from every county in the state with which to make his experiments.

Both Monterey and Santa Cruz counties are attracting wide attention by means of placing upon the markets apples which are unexcelled in quality.

R. M. Teague, of San Dimas, has just issued the third edition of "Citrus Trees," a beautifully illustrated pamphlet of fifty-five pages. Mr. Teague is probably one of the most successful fruit tree growers on this coast, and is fast acquiring a reputation which brings him orders wherever citrus trees are grown.

Dr. Archibald H. Ward, of the California poultry experiment station, has, after considerable investigation, found that the fowls of various portions of the state are more or less afflicted with tuberculosis. He says he knows of no cure whatever for the disease. It can only be controlled by keeping the sick fowls away from the healthy ones.

A new horticultural society has been organized at Boston. Its purpose is to make a scientific study of botany and chemistry, and to promote the scientific aspects of horticultural investigations—in short to systematize horticultural knowledge now in such chaotic condition into a more scientific form. It hopes to interest horticulturists in all parts of the country.

The Southern Pacific Company has made a careful calculation of the bean crop in Southern California and their figures differ materially from the estimates given out a week or two ago. Here are their figures: In Ventura and Santa Barbara counties 600,000 sacks; Los Angeles county 100,000 sacks; Orange county, 50,000 sacks. This estimate is about 100,000 more sacks than a late estimate made by other parties.

The superintendent of the Santa Fe fruit line has made the statement that he has calculated that the haul this season of fruit over that line will amount to 17,000 cars. That is an increase of 3500 over last year. The company has just given an order for 500 new refrigerator cars. They now have in use 3500, independent of the Armour line and other companies operating private cars.

At a regular meeting of the Santa Rosa Poultry Association, recently held, the name of the Co-operative was changed. It is hereafter to be known as the Sonoma County Poultry Association. The newly elected officers are: Charles Gillett, president; James Cahill, secretary; W. J. Dillard, treasurer. Following this action a new poultry company was organized, they taking the name of the Santa Rosa Poultry Aassociation. J. J. Fitzgerald will be secretary and manager. The other officers will be chosen later.

The California fruit distributors estimate that this year they will ship from this state about 7500 car loads of deciduous fruits, sent to 125 Eastern cities. The net returns of this fruit to Californians will be about $500 a car. Thus the growers will receive through their organizaztion the large sum of $3,600,000. They say they are handicapped seriously in one respect. Fruit is shipped in refrigerator cars, icing stations are forty hours apart. Too frequently the ice gets low and fruit is damaged. They demand better service hereafter of the railroads.

The stocks of wheat on hand in Central California on September 30 in the warehouses were as follows:

Tons at—	1902.	1903.
San Francisco	2,038	2,964
Stockton	43,512	37,098
Port Costa	41,438	11,250
Totals	86,988	51,312
Decrease		35,676

The stocks of barley at Port Costa and Stockton were as follows on September 30th:

	Port Costa.	Stockton.
1903, tons	51,977	16,537
1902, tons	45,952	9,318
Increase	6,025	7,219

The total stock of barley in Call Board warehouses, September 30, 1903, was 41,467 tons, against 64,000 tons September 30, 1902.

The price of silver bullion is now 59 cents an ounce, the highest price since July 1, 1901.

Edward A. Beals, of the Weather Bureau, estimates that there are now 7,000,000 acres of irrigated lands in the United States.

It is feared by prune raisers in some sections of the state that this seasons' output will fall below the yield of former years to considerable extent.

The Earl Fruit Company having recently shipped quite a quantity of fruit from San Jose to Australia are now making up four car loads of silver prunes and pears for London.

The cotton crop of Texas has been damaged fifteen per cent. by insects. The estimate of the probable yield is now placed at 2,500,000 bales, a reduction of 500,000 from former estimates.

Edward W. Parker, of the United States Geological Survey, reports that for the first time in the history of this country the production of coal has reached a total of 300,930,659 tons, valued at $373,133,843.

W. C. Stone, state statistican, has completed all copy for the "State Blue Book." It is about ready for distribution. It contains a vast amount of useful information for the farmer as well as those of other callings.

The subject of good roads is engaging the attention of the people of several states. The legislature of Pennsylvania recently in session appropriated $6,500,000 for road improvement, to be expended within the next six years.

Newspapers in Southern California appear to be sharing the general prosperity which attends other business. The Riverside Enterprise has just put in a duplex press and a linotype, thus giving the paper one of the most complete plants in this part of the State.

Cosmo Morgan, agent for the American beet sugar company received on the 1st instant, at Los Angeles, a telegram stating that a difference of 20 cents had been made between cane and beet sugars, a drop of ten cents 1or the beet product. The unexplained feature of the case is that a difference of only 15 cents has been made in the San Francisco territory as against 20 cents in Los Angeles, and the price of beet sugar is no longer uniform over the coast.

Quite recently the fact has developed that California is to have another trans-continental railway. It is known as the Western Pacific. It has just applied to the harbor commissioners for terminal privileges at San Francisco. It has purchased terminal facilities at Oakland. To the southward surveys have been made and rights-of-way secured. The line will run from San Francisco to Los Angeles through Bakersfield, San Jose and Santa Paula.

The Sacramento Valley Development Association, at a late meeting, planned a great deal of work to be done in the way of advertising their attractions. They will scatter broadcast a great quantity of literature. This literature will be well illustrated by pictures of orchards, farms, scenery, etc. Large signs containing suitable lettering will be strung through the valley, to be read by passengers on the cars.

Prof. Stubenrauch has publicly stated that he is authorized to say that the agricultural department, at Washington, asks that donations of fifty acres be made to the government on which the department may establish gardens for the purpose of testing trees, plants and seeds. If not donated a low rental only must be demanded. The land must be choice as to soil and have some hill and some level lands.

Dr. N. K. Foster, secretary of the State Board of Health, claims that the rapid dying of the ground squirrels in Contra Costa county is not due to any inoculation by professors of the State University but from some unknown special disease. The doctor says he will make a thorough investigation of the matter and if he decides that there is no danger to human beings, he will use the virus from the dead squirrels in killing rats in other localities.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

MY CHICKENS.

(Continued from first page)

ens. The hatching from the first was successful. Of course there were accidents and disappointments. One incubator full was lost by a little boy amusing himself with the regulator when I was out, he cooked over two hundred chicks in the shell, another incubator with a disc went wrong, the ether had evaporated and another hatch was cooked. The cat slept on top of an incubator and the regulator and cat failed to regulate, and the chickens failed to materialize. Provoked sometimes, but not discouraged I kept on and as the days flew by the accidents grew fewer. Accidents with

Indian Runner Ducks.

the brooders also occurred, lamps smoked and instead of White Rocks I had smutty gray chicks, and at other times two whole brooderfuls were suffocated by the fumes. Heart aches these were. The profit side of the ledger, notwithstanding these accidents, showed a very healthy increase.

Then I began to advertise and to exhibit my fowls. The advertisements hatched out buyers as effectively as the incubators hatched out chickens. I had good fowls and told people in simple words what I had and whenever I had an inquiry by mail I answered promptly. I was patient with people who only came to see the ranch and ask questions. I tried to treat everybody liberally and especially to help women, who were struggling with the same difficulties I had experiensced.

Pleased customers and judicious advertising gave a greaat impetus to the business. Every cent of outlay was carefully considered and, though the best grain was purchased for the fowls, it was bought direct from the mills, and as far as possible purchase and sales were made at first hand.

To make a success of the poultry business close peresonal supervision of every detail is necessary, not only in the hatching and brooding, but in the buying and selling. It is the close attention to the little things that in the end makes the business pay.

In the fancy poultry breeding close attention must be given to fancy points. The American Standard of perfection must be carefully studied, those fowls that do not come up to standard requirements have to be discarded from the breding pens and must be prepared for market purposes. The cockrels are caponized. This is done to render the flesh more juicy and tender when it commands a higher price, just as steer beef brings a higher price than bull beef. Caponizing also quiets the cockrels, they do not fight and scrap, can be kept more closely crowded or allowed to run with the hens. They are no longer restless and turbulent. They spend their time in growing and putting on flesh instead of quarreling amongst themselves and annoying the hens.

Twice a Day They Claim Their Ratio s.

All chickens for market are stall fed from two to three weeks in the French fashion. They are placed in fattening coops in a darkened place. Three times a day they are given a feed of oatmeal, corn meal, barley meal and wheat middlings mixed with milk. They are given all they can eat in twenty minutes, then the food is removed and water is left for them. Before killing them they are kept twenty-four hours without food, then dressed for private customers who gladly pay from ten to fifteen cents a pound above market price for the sake of getting so toothsome a dish. The feathers being white and from perfectly clean fowls are well worth saving, white feathers commanding the best prices. The income from the sales of fatted fowls, those that are not worthy a place in the show room, is quite a large item.

Laying for Business.

Eggs from pullets or immature hens are sold for family use and, being guaranteed perfectly fresh, bring five to ten cents above the market price. The broilers and fryers, capons and roosters, as well as eggs for table use are merely side issues to the main business of breeding and raising prize winners, and of selling eggs from them for hatching. None but a fancier knows the pleasure of this, and the close attention necessary. A hearty laugh from a visitor was elicited by my asserting that I knew the father and mother, grandfather and grandmother and even the great-grandfather of a promising young cockrel. He came from prizewinners. Time would fail me to tell of the fascination of this mating and breeding for prize winners. They say some women are born matchmakers, and to make correct matings in the poultry yard is almost as serious a study as in the human family, but to the successful matchmaker it is intensely interesting. Twenty-seven prizes won by my White Rocks at the last show are a proof of my success as a matchmaker.

A friend arriving from Australia, brought with him two pair of Indian Runner Ducks, so-called from their activity and from their originally being natives of India. These he asked me to keep for him for a year. I soon saw their great value as prolific layers of most delicious, delicate white eggs, quite different to the coarse, strong tasted pekin eggs. And I found that coming from a tropical country they were wonderfully adapted to dry weather. I bought them. They had averaged 223 eggs per duck in one year. Realizing the necessity of fresh blood, I bought two strains of the best blood in the land, and again found myself launched in a new and very profitable side issue. These ducks are as fine flavored as canvass-backs and bring a good price on the market.

Two other side issues white Holland Turkeys, and Mammoth English Runt have also proved profitable and interesting investment.

* * *

ANSWERS TO CORRESPONDENTS.

Editor Cultivator: Will you please have the lady who gave us such a fine talk on how to raise eggs for profit, and who runs the poultry and egg factory in your valuable paper, give us the cause, prevention, and remedy for weak legs in Indian Runner ducks. Also the most profitable number to keep in a flock.—W. S. M., Upland.

There is something wrong in the management of ducks if they are weak in the legs—the food has not enough bone making, (or protein) in it, or they are in some way weakened—have been fed a very fattening ration or chased and freightened until they are lamed—feed them according to the directions in the Cultivator of March 20, giving plenty of shell and grit. Ten ducks of the Indian Runners to one drake is the best number, be sure not to in-breed.—Mrs. A. Basley.

A Pen of Beauties.

A Plymouth Rock Prize Winner.

A WISE OLD GANDER.

A writer in Our Fourfooted Friends relates the following story of an intelligent gander: One morning he came up alone. He evidently had something on his mind; he was troubled. He bowed three times (he was ever polite) and said something I could not understand, and then walked back along the path to the corral. Finding I did not follow, he returned and bowed again and said something. Then he walked down the path again, and it occured to me that he wanted me to follow, which I proceeded to do, evidently to his great satisfaction.

He led me down to the irrigation ditch, where I beheld the whole flock seated in a circle around his favorite goose, whose leg was caught in a steel trap sat to catch foxes. They appeared to be encouraging her with consoliatory remarks, and my appearance was greeted with wild shrieks of delight. I released her and received the thanks of all, with an especial speech from him. The goose was not hurt, and her mate noted his satisfaction with many caresses.

CAPTAIN MITCHELL
SANTA BARBARA, CAL.

POULTRY MAKES MONEY

To keep poultry successfully requires as much knowledge as any other live stock industry, yet for the money invested it yields the largest profits. From my experience, which is that of the average farmer, I conclude that plenty of grain fed in litter, with fresh water before them all the time, will make hens pay. As most farmers are situated it is not possible to feed much meat, yet what there is should not be wasted.

As to feed, corn is the most important, the cheapest and yields the largest returns. But as corn is too high to feed in California oats comes next. Wheat is too costly, except for chicks. Alfalfa hay should form an important part of the winter's feed, as its bulk tends to neutralize the solidity of grain. Potatoes, beets and cabbage are easily grown and form cheap winter feed. Pure-bred fowls should be raised, as they pay better than mongrels. The poultry business will never be overdone as long as beef remains at its extortionate price.

POTATO BEETLES AND HENS

I do not think my hens have a depraved appetite, rather a very natural one, though I suspect some will not agree with me when I say that they have an appetite for potato beetles says a writer in the Poultry Advertiser. For the past two years my neighbor and myself have raised potatoes on lots adjoining our poultry houses. About one-half or three-fourths of an acre for 150 hens. True, hens have been kept on the same ground, not in yards, for a dozen years or more. Quite likely there are fewer insects than in former years. Possibly the taste of potato beetles is partly cultivated, but the scheme at present is a success and is worth trying by others.

My neighbor is quite a successful poultry keeper in connection with his regular farm work. I called to see him feed his hens one day, for I heard he had an improvement on the "morning mash." He feeds in the morning ground oats and corn, or bran and corn, but puts it in the feed troughs dry, supplying plenty of warm water in the drink dishes. The fowls will run back and forth from feed to drink frequently and seem to enjoy mixing their own mash. Whether the hens pay just as well, I cannot say, but they seem to like the feed and they pay a handsome profit. Of course, they exercise a little, and for what I know the dry feed may be better for them. There is no doubt that horses do better when fed dry grain. I haven't dared to try my hens the new way except as occasionally I give a little the second time around, when I go through to see if any have too much or too little feed. I think I shall experiment a little but not much until I am more certain it is right.

Dampness and draughts are the main cause of roup in poultry. Keep the fowls in a dry warm place, and there will be little if any danger from this disease.

Five hundred hens properly managed on a farm will support a good sized family, leaving the proceeds of the farm to pay off the mortage or to invest in more land.

It is a mistake to think that ducks cannot be raised without a swimming pool, as they need only enough water for drinking purposes.

The guinea fowl is the best insect destroyer among fowls, as it eats many insects that other fowls will not touch.

Ground mixed feed is all right for poultry, but it should not be sloppy, nor so soft that it will all fly to pieces and scatter when it is thrown on the ground.

If there is any better feed for hens than the table scraps, it has not yet been found. It will pay better to feed them to the poultry than it will to the pigs.

Chickens are like cattle in this, that it costs no more to feed purebreds than it does scrubs, and they pay much better.

ROUP AND CHOLERA

Say! Mr. Poultry Raiser? How about your chickens? Are you bothered with Roup and Cholera in your flock? Have you tried everything from "Pink Powder for Pale Poultry" to the magnetic treatment, without success?

PALMER'S POULTRY POWDERS

Trade Mark

We have what you've been looking for — a guaranteed cure for Roup and Cholera—something that cures in every case if used according to direction. Palmer's Poultry Powders—the only infallable remedy ever offered the public for Roup and Cholera. Manufactured in your own State by the

PALMER POULTRY POWDER CO.,

102 South Spring St. Los Angeles, Cal.

Palmer Poultry Powder Co.,
Los Angeles, Calif.

Gentlemen: One of my neighbors recommended your roup remedy and I used it on my chickens. They are now entirely well, and I can't speak too favorably of it. I tried seven remedies in three months without satisfactory results, but from now on your roup remedy will always find an admirer in me.

Respectfully,
MRS. LIDA STANLEY,
143 East 18th Avenue, Los Angeles Calif.

Los Angeles, Calif., Oct. 5, 1903.

This is to certify that I have used Palmer's Poultry Powders for roup and cholera with gratifying results. My chickens had both roup and cholera. My husband brought home a sample of both remedies, which I used, and now have no disease among my chickens. I can't recommend it too highly. It is all it is advertised to be. I would not take ten times its price and be without it.

(Signed) MRS. T. F. MINOT,
942 W. 32nd St., Los Angeles.

Palmer's Poultry Powder Co.,
102 So. Spring St., Los Angeles.

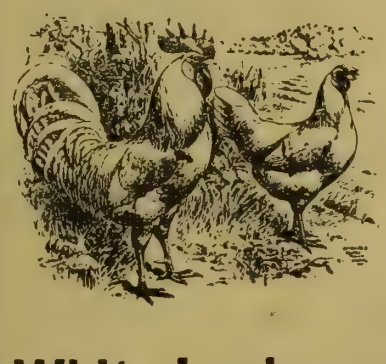
I started in the chicken busines in a small way almost six months ago, and found roup a barrier to my flock until last week, when a friend asked me to try your remedy as it was sold under a guarantee. I followed her advice and today my chickens are in a healthy condition and no trouble whatever. I'm glad to express my gratitude to the manufacturers of the wonderful roup cure and gladly recommend it to others.

J. T. MIKLEMAN,
Anaheim, Calif.

Oct. 4th, 1903.

To all whom this may concern: I hereby certify that I had both roup and cholera among my chickens. Two doses of Palmer's roup remedy cured my chickens of roup and the cholera remedy was equally effective. I don't think Palmer's Poultry Powders has an equal on the market today, and I would not be without it while I keep fowls for three times its price.

(Signed) E. T. RIDGEWAY,
1000 Maple ave.



White Leghorns AND Barred Rocks

The leading varieties and the best of each. My fowls are good size, standard color and have the best of qualifications throughout. They are standard bred and utility bred. They have proven their superiority in the show room and as breeders. They have taken first premiums wherever exhibited. Over fifty premiums in the last four years. Motto: First-class stock and eggs at reasonable prices. Send for illustrated circular giving show record and prices. **G. I. LYTLE, 2006 So. Grand Ave. Los Angeles, Cal.**

Don't believe all we say but just enough to try our Poultry foods.

Rivers of Water, Richest of Soils, with Climate That is a Genuine Warm Number

Fattening Cattle on Farm of D. G. Whiting.

AN IMPERIAL TRIP.

For the past two years the worth of a vast "worthless" section of California—a part of the Colorado desert—has been told to home-seekers. It is a section the proof of worthlessness of which has been established by a large number of deaths of hardy prospectors who have ventured into this dreary vastness and succumbed to terrible thirst and heat. But today the pioneer is erecting the first homes and cultivating crops which are making good the promise of the promoters who have investigated, planned and developed a wonderful system of irrigation.

A HALF MILLION ACRES.

We refer to Imperial, the oasis in the desert. Imperial, with its half a million acres of wonderfully fertile land and a half a million of inches of water and a climate which makes Jack's bean stalk almost a possibility.

This land lies on the extreme southern boundary of California, from which it extends north fifty or more miles to the line of the Southern Pacific in a body twenty to forty miles wide. All told about 3000 square miles of this land may be covered by water in both California and in Mexico. This body lies in a position a little east of the center of the state line from the Pacific to the Colorado, and is 188 miles from Los Angeles.

The slope of the land covered by the system is north and west from a depression of just one foot below sea level at Calexico to nearly a hundred feet below sea level in its lowest portion. Of course the lowest portion of the Salton sink reaches the remarkable depth of 280 feet.

IT BEGAN.

The bold idea of reclaiming this vast area occurred to a man by the name of Wozencraft 'way back in 1856. He took the matter to the national congress and in '58 a bill was introduced to grant a vast body of land to him on condition of the construction of a canal and irrigation system. But the days of the civil war arrived before the bill could be passed and the matter was dropped till taken up by the Arizona & Sonora Land & Irrigation Co. in 1891. The company was also known as the James Beatty Co. This concern spent some $175,000 in investigation and in maintaining offices. The engineer who had charge of the preliminary work of this company was C. R. ("Colorado River") Rockwood.

PARTIAL FAILURE.

This company went to pieces without results, but Mr. Rockwood had secured information which gave him such faith in the enterprise that he proceeded to interest capitalists. A. H. Heber and other capitalists took up the work and organized a company known as the California Development Co., also another company, practically the same, under the Mexican laws, to control the canal which, through most of its length, passes through Mexican territory.

BEGINS TO DO THINGS.

This company was on the verge of going to pieces in '99. L. M. Holt finally secured the financial support of George Chaffey, and though he later retired from the company was the means of giving the company an impetus which ultimately led to success.

A. H. Heber is president, C. R. Rockwood first vice president and general manager, F. C. Paulin second vice president, R. T. Perry secretary and W. T. Heffernan treasurer. This company has to do only with the construction of canals, the disposition of water, etc.

LAND AS WELL AS WATER.

Another company, the Imperial Land Company, for acquiring and disposing of land, has been formed. This company is under the general management of F. C. Paulin and that pioneer promoter and journalist, L. M. Holt is advertising manager.

A LOW DOWN EXCURSION.

By invitation of these gentlemen and under the guidance of a party of newspaper men, some with their wives, and all told over thirty people, made the trip to this section of the Colorado Desert last week. The start was made via the Southern Pacific, a standard Pullman being at the disposal of the party for the four days of the trip.

The start was bright and early on the morning of October 3d, with a jolly party aboard. The first thought was to get information of the Imperial valley—some who had been before, to compare notes—and secondarily to allow no moment to pass without some fun aboard.

Mr. Holt had characterized the event as a "Low Down Editorial Excursion," because for "three days, one hour and forty-four three days, one hour and forty-four minutes—from Indio to Calexico and return—the excursionists will be below sea level."

DOWN AMONGST THE MERMAIDS

At Salton our lowest point was reached—263 feet below sea level. The salt plows and scrapers, with great piles of salt, were seen from the train. A wonderful mirage with a beautiful sea dotted with islands was approached, but kept receding. We thought of the many cases in which the prospector, dying from thirst, has seen just such scenes.

BRAWLEY.

At Brawley, still below sea level 65 feet, our first stop is made. A number of carriages were in waiting, and the party were driven several miles to the banks of the New River, where a great trestle carries the canal across the chasm. A view of this trestle appears on first page of the cover of this issue.

The banks of the river which are cut down to a depth of forty feet show no change from top to bottom. Fine loam soil at top, fine loam soil at middle and not a particle of difference at the bottom.

The condition about Brawley is such that a person with an eye to agricultural development may readily see a wonderful future for that section. As yet the original desert condition prevails in most of the surrounding country. The only thing which indicates its coming wealth is the lines of the canals carrying the life-giving water. These are uncrossed by bridges, so that the drive took us down into some of the deeper ditches nearly to the wagon bed. Occasionally a cultivated field was passed where there was either alfalfa, Kaffir corn, sorghum, Egyptian corn, Milo maize, millet or other fodder or forage plants, showing how prolific may be this entire section. In the entire ride over this valley not a single animal was seen that was not sleek and in the best of condition. The land is as a rule, as even of surface as a table, excepting for an occasional hummock where the drifted surface soil has been caught by the wind and lodged against growing vegetation. The cost of leveling and clearing this land varies from fifty cents to three or four dollars per acre. The slope being so exceedingly gradual, the erecting of low banks which follow the contour of the land, makes irrigation of large areas possible at very light expense. A forty acre field will have but very few of these checks or contours and after the first irrigation when the banks become settled, the flooding is so simple as to be done with scarcely any labor.

On the return to Brawley a dusting up was followed by a good supper and at our car later we were met by a delegation from Imperial headed by Editor Howe of the Press.

IMPERIAL.

Mr. Howe and his committee endeavored to convince the visitors that there were things doing in Imperial which would make the eyes bulge. He was informed that if there was not, there would be when the visitors arrived and found something to eat. The run from Brawley to Imperial required but a few minutes.

The city of Imperial, the "center of the universe," is located 65 feet below sea level and has as yet a look which partakes somewhat of rawness, but from the way the agricultural implements and other evidences of things doing, it is apparent there is an endeavor to wear off any such appearance. The first and most prominent feature noticed as we emerged from the car in the morning, was the stock yards on one side of the track and warehouse full of grain and newcomers' families who are forced to bunk in any old place, pending the building of a home. The greatest development observed in the entire settlement is about Imperial. After a hearty breakfast the entire party em-

There Are Seventy-Seve

Grain Stacked Up for Shipment at Imperial.

Field of Milo Maize.

barked for a two days' trip, the first stop being at Silsbee on the shores of Blue Lake. This is a beautiful sheet of water a mile and a half wide by two miles long. The town as yet made up of only two partially completed buildings with a small store in a tent which dispenses the various necessaries of life to the settlers of this vicinity. Luncheon was taken in a canopy by the mesquite immediately on the shores of the lake. Some of the party went out for a short row but the boat not often being used for this purpose, had shrunk to that extent the leaks were such that it took the most of the party to do the bailing to keep it afloat. The ladies did not engage in this pleasure. From Silsbee, which is fourteen miles from Imperial, the caravan took up its way to Calexico, twelve miles further and immediately on the boundary between the United States and Mexico. Here we saw the first blue-grass lawn.

DOWN ON THE LINE.

The principal building of the place is the company's headquarters and hotel, which is all in one building, or rather two buildings some distance apart, but all covered with one great roof and with wide veranda all about the building. The building faces the international boundary line which is but a few feet away. Just beyond is Mexicali, the only Mexican city on lands controlled by the company.

The lands over the line for many miles are fully as rich as on the American side and the company will supply them with water as needed. In fact the contract with the Mexican government calls for supplying some 300,000 acres of that country with water.

COTTON AND CANE.

One of the interesting experiments in the company's garden here is the growing of cotton. A long fiber cotton which has been pronounced by government experts as the best grown. This may lead to the extended production of this high grade cotton, especially over the line where cheap labor may be had. Hawaiian sugar cane, artichokes and other interesting products of the garden were inspected.

The stay at Calexico was all too short. Chief Engineer Rockwood and First Assistant Perry proved admirable hosts, and the home like appearance in contrast with many of the desert scenes was refreshing.

Leaving Calexico about eight o'clock in the morning, the caravan started directly east along the north side of the border, but soon passed over the bridge of the canal which follows the north side of the line, and entered the Mexican territory. The road soon veered to the south and we headed for the Alamo river, from which point the first main canal takes its start for the United States.

A TRIP ABROAD.

The Alamo river serves as a natural canal for this water for a distance of fifty seven miles from the dam at the Colorado river to the headings of the canal near the American line. This was an exceedingly picturesque location and had the appearance of having abundance of duck and other game. The attendant who had charge of the house and watches over the head gates here was congratulated over having a soft snap, with no work to do and with guns and boats handy for pleasure; but he glanced at the different members of the party and remarked,—that it was mighty lonesome work, and did seem awfully good to see civilized faces once more. The stop was but a few minutes, long enough to eat a couple of dozens of water melons upon the banks of the river. From here the road swung back to the American line, within a few miles. We again entered our native land, and congratulated ourselves upon our safe arrival from our trip abroad. The road followed the main canal which runs to District No. 5. On this road we passed some lands absolutely unreclaimed for several miles. In fact, some of the best lands of the entire trip we probably passed on this ride in the section where there are now no farms whatever. Some of this land is rougher than that about Imperial and will require more expensive work in grading. In fact, some of it will be so expensive as to prevent reclamation for many years, when land values become much greater.

SOME ELECTRICITY.

Luncheon was taken on the banks of the Alamo a couple of miles south of Holton. Here a force of men were at work grading and preparing for a large bulkhead across the chasm which is to raise the water on to the plain which will be carried to the city of Holton and there used to develop electric power for use over the entire valley. A drop of some forty feet may there be secured and the contract is already let for the erection of a $75,000 electric plant. After luncheon we embarked for Holton and there the photograph of the party was made by the official photographer of the excursion, on what was said to be the public square of the city. The square seemed to be a circle, for there was no obstruction except the distant mountains in the entire circle. The castles are still in the air, for as yet the corner stake is the only evidence of the city of Holton. The wondering jackrabbit sat under the mesquite, while Mayor W. F. Holton made a welcoming speech and gave a hearty invitation to make our abode in his city.

In driving from Holton to Imperial some magnificent country was passed and some fields of Kaffir corn and Egyptian corn that were truly amazing for the amount of fodder which they are producing.

One of the prettiest places is that of J. H. McKim of Pomona, who has done some of the most effective work in grading, fencing and planting of shade trees. South of this is another large stock ranch belonging to D. G. Whiting of San Bernardino.

A FEAST OF REASON AND OTHER THINGS.

The citizens of Imperial tendered a banquet the last evening of our stay in the valley, which gave the visitors an opportunity to get acquainted with many of the citizens and learn of their work and their belief in their community. One thing was noticeable, there are absolutely no kickers, every one having perfect faith in his community.

With many parting expressions of good will and wishes for a great future for the Imperial valley, our train pulled out at 10:30, with three rousing cheers for Imperial, which were answered by Imperialists.

* * *

IMPERIAL NOTES.

Fifty-seven miles of the Alamo river is used to conduct water to the headings. Two dredgers are constantly at work clearing the channels and strengtening the banks.

There are seventy-sevn miles of main branch canals which carry water to the different companies.

There are eight mutual companies which handle the distribution of the water to the various farms.

The water is delivered to these companies by the California Development Company, but the local management is entirely mutual.

There are eight of these companies, known as "Imperial Water Co. No. 1," "No. 2," "No. 3," etc.

To distribute this water there are 445 miles of latterals which now convey the water to over 200,000 acres.

Of that 200,000 acres, 50,000 acres were cultivated this year, and it is estimated that next year's work will more than double this or possibly reach 125,000 acres.

The possibilities of this section, especially in stock growing and dairying are wonderful. Raisins seem equally so. Other fruits may later prove profit winners, but so far stock is by long long odds the favorite.

At the banquet at Imperial Editor Howe, in his welcome to the guests, referred to the many cities of the valley as the "Invisible Cities." Cities of the future which must be brought into existence to supply the trade which will be created by the settlement of the country.

The total cost of the irrigating system as completed will aggregate approximately $7,000,000.

Some of the farmers and stock growers near Imperial gave us some interesting figures regarding cost of production of grain and other crops by irrigation and the profits which were secured from those crops. Space and time forbids them entrance to the paper this week, later they will make good reading.

One novel method of road making is occasionally followed about Imperial, also Coachella. The roads are kept perfectly level from side to side with a low dike in the center, also one on either side. This makes two trackways, one of which may be filled with water from the ditches. When this is shut off and the ground hardened, the teams occupy that roadway, and the other side is flooded. This alternating back and forth gives fine hard roads all the year if they are given constant attention.

Speaking of the Coachella reminds us that we have some interesting notes regarding that section which we will use in some later number of the Cultivator.

Alfalfa—the Mortgage Lifter.

Field of Alfalfa.

C. H. SESSIONS, ASSOCIATE EDITOR

PURE-MILK CRY.

The cry for pure milk has sounded from San Francisco to San Diego. It has been found that the milkmen have been using "preservaline" and formaldehyde and various other fixings in the vended fluid, in order to keep it relatively sweet during the warm season. The creameries in certain localities are said to have the same method for keeping butter from getting rancid. Milk inspectors have been vigorously prosecuting dairymen who use preservatives in their milk and it is to be hoped no cessation of interest will be manifested in inspecting both milk and butter, to the end that all death containing potions may be driven from the butter and milk industries.

NEW CATTLE FOOD.

Successful experiments have been made by ranchers at Bolsa with varieties of pennisetum as a fodder plant for cattle. One rancher has succeeded in getting crops of the grass that will make a total yield of ninety tons per acre per year with cuttings each month. The quality of the food compares very favorably with millet and is especially valuable for cutting and siloing. Specimens ten feet high are now on exhibition at the Chamber of Commerce in Santa Ana, although the crop is usually cut for feeding to stock when it atains a height of four or five feet. After each cutting it sprouts up from the old roots without replanting. A similar variety of grasses are a common stock food in India and other eastern countries.—Anaheim Gazette.

A new venture in the vicinity of Grand Rapids Mich, is the feeding of range sheep to be sold on the Chicago market. The first 3,200 arrived on August 7th. and were driven to a pasture south of the city.

* * *

A demand for sheep in California being greater than the supply, it is natural that Texas, New Mexico and Arizona will be called upon to supply the deficiency. Twenty years ago it was different. Then the ranges of Texas and New Mexico were being stocked up from California.—National Live Stock Grower.

* * *

The Australian wool authorities are looking for higher prices of wool on account of the shortage in production the loss of sheep due to the drouth being very large. The drouth is over but the losses remain.

* * *

The Gentleman's Magazine contains notice of the accidental death of a cart gelding, owned by Richard Fendall, of the Grange, Southwark, London, England. The horse died from the effects of a cut on the knee, he having somehow got into a difficulty with a large garden bell glass used for forcing melons. This horse had been forty-four years in Mr. Fendall's possession, and had been the property of his former owner for fifteen years, whence it would seem he was fifty-nine years old when he met with the accident which caused his death.

* * *

Thousands of cattle and sheep are reported to be suffering on the plains from recent heavy snowfall, rain and cold weather.

* * *

A great scarcity of hogs is reported in Oklahoma, owing to prevalence of cholera two years ago, which swept away nearly all large herds. Now, with prospect of a large corn crop, there is a general desire among farmers to get hold of hogs. The climate, soil and general conditions of Oklahamo are favorable for swine breeding Country Gentleman.

Milk is worth more when fed to hens than when fed to pigs. The hens like it, sweet or sour.

* * *

The hay market has weakened a little at Stockton. The best wheat hay commands about $11 per ton.

* * *

The dairyman's success is wholly due to the strength of his cow. If she has no individuality she has no merit.

* * *

The Pacific Coast Trotting Horse Breeders' Association held a most successful and enthusiastic meeting at Petaluma last week.

* * *

In Northern California the cattlemen are losing stock from the "loco weed." Sheep and horses eat the weed as well as cattle.

* * *

Henry T. Oxnard has just purchased 800 acres of land in Napa county and will move his famous stock farm from Lexington, Kentucky, to his new location. He has a herd of fine thoroughbreds.

* * *

Five thousand sheep near Boise, Idaho, died last week from eating a poisonous plant known as the wild pea. The ground was soft from recent rains and the sheep pulled up the plant and devoured the roots.

* * *

The owner of Lou Dillon, the Santa Rosa two-minute trotting mare, has had three offers to sell her. The prices offered were $50,000, $60,000, and $75,000. Mr. Billings, her owner, has not yet decided to sell. He paid $12,000 for the animal.

* * *

Dr. Samuel E. Bennett, of the United States Bureau of Animal Industry, has made extended experiments in studying the diseases of cattle in this State. He says that the vaccine virus used in some parts of the country produces a disease very like that of the foot and mouth disease.

* * *

Six years ago Canada exported in hams, bacon, and pork $4,500,000 worth; last year the figures were $12,500,000. Nearly treble is a good increase, but 12 times is still better, and that is the rate at which the poultry exports advanced from 1896 to 1902.

* * *

Anthrax is prevailing in Colorado, chiefly in the Arkansas Valley, where cattle and hogs are dying in large numbers, the owners not knowing what disease affected them, and not taking proper precautions, even feeding carcasses to hogs. State Veterinarian Lamb has the matter in charge.

* * *

Great Britain has removed its embargo on cattle and sheep from the United States. Secretary Wilson officially announces that the foot and mouth disease has been eradicated from all the eastern portion of the Union. To accomplish this 3900 cattle and 590 hogs and sheep were slaughtered and 200 premises were disinfected. All this was done at a cost of $300,000. Cattle and sheep may now be shipped to Europe from this country.

* * *

Dr. A. M. McCullom, county vetrinarian of Sacramento county, is having success in treating hogs afflicted with cholera. He uses a trough 18 feet long, 3 feet in depth and 2 feet in width. In this he puts a solution of sulphur, 12 pounds; lime, 12 pounds; formalin, 2 pounds; carbolic acid, 5 pounds. The lime and sulphur are boiled together and afterwards the other ingredients are added. The solution is put in the trough and the trough filled by water. The swine are dipped every third day for three weeks. The doctor in this way cured nearly all the animals so far treated.

THE DAIRY.

The following notes are selected from Dairy and Creamery:

In feeding dairy cows, consideration of their future must first be thought of. The supply of milk must be permanent and not temporary. Consequently any system of feeding that will reduce the normal or injure the animals should all be condemned. Concentrated foods are all right in their place, and every dairyman can avail himself of them to a certain extent to help increase the milk supply; but the animals must depend upon a variety of food, in which succulent food, such as grass and ensilage, is the great foundation, if their health is to be retained and their normal yield of milk kept up.

As to remedies and specifics to bring cows into a normal condition, there are many, but the sure thing is far from being found. A change of sires is recommended, and in some individual cases was effective. There are many advertised specifics that are often credited with efficiency, but as often fail. Starving the cow for a time previous to her periods, followed by generous feeding of oaten feeds, has caused, supposed, desired results, but the fact remains that barren cows are frequent, and all the more serious because of the fact of their well-directed breeding and superior milking qualities with strongly developed nervous organism. Scrub cows and semi-active temperaments are rarely other than sure breeders.

THE COW AND THE CALF.

The dairy calf, to be raised economically and with the greatest chance of developing into a valuable dairy cow, must be raised by hand, says J. H. Grisdale, in Farmers' Review. True, considerable skill and careful attention are necessary to success. First, regularity of feeding; second, uniformity in quantity of food; third, uniformity in quality of food; fourth, uniformity in temperature of food; fifth, cleanliness. The young calf should be fed at least three times a day for two or three weeks, and preferably four times. The ration for the first week or ten days should consist of whole milk fed at a temperature of about 100 degrees Fahr. This ration may be gradually changed to skim milk by introducing a small amount into the whole milk ration and gradually increasing the proportion, being careful to feed always at the same temperature. The place of the fat removed in the cream may be taken by oatmeal or flaxseed meal boiled, being careful to make but a very slight addition in the usual amount at any one time. Most ills that calves are heir to arise from a violation of some one of the principles I have mentioned or from a lack of cleanliness, almost every case of scours or indigestion may be traced to some sudden change in the time of feeding, the quantity or temperature of food fed. "The boy is father of the man," is a trite saying, but even more surely the calf is mother of the cow. The ill-fed, dyspeptic, unthrifty calf never can hope to develop anything but a common place cow, and two or three successive generations of calves so treated are surely enough to kill the aspirations of the most sanguine dairyman. The calf once past the age of three months is surely safe, the danger from that time on lying in the risk of getting too much and no less. I believe a creameryman should know, when he furnishes a set of tests, that he would be able to go before court and swear they are correct. It does not take the patrons of a creamery long to find out whether the testing is done carefully or not. I do not believe it pays for a man to attach an air of mystery to the method of testing, or to keep the time of testing a secret and allow no patrons to be present. Rather announce the time the testing is to be done and invite all to be present, and demonstrate how simply the system is carried out. Let a factory manager once gain the confidence of his patrons by accurate, careful work, and the trouble over this question at the factory is about over.

As showing the growing interest in the subject of forestry in the United States, it is stated that there are now three national forestry associations, with state organizations in eighteen states and one territory.

The Jersey Cow at Home.

My tiny little kingdom of Jersey lies altogether to the south of England, in latitude 51, which is pretty well north in the Americas, but pretty well south here where the warm waters of the Gulf Stream temper things. Jersey is a bit of France, really, though for many centuries it has been under English rule. It is a loyal part of the great empire, though strangely enough the common language is yet largely French as is the language of the courts. It is on the map a most tiny and insignificant island. Even when aboard of it you must be careful not to ride too fast or you may ride off it on one side or another. It is, roughly speaking, ten miles long and five miles wide and perhaps a tenth of a mile high. And it has about 52,000 people at home, and God alone knows how many elsewhere. So much for statistics. Now to see what she has done to achieve fame.

God made Jersey very rich and fruitful and that it might never be destroyed by the hungry sea, girded it about with iron cliffs and rocks against which the waves gnaw endlessly but in vain. There is a tradition that once land extended nearly to France, now only visible in the distance some ten miles away. It must have been low land and the sea has devoured it all. It can go no farther in this age. How such hard and unyielding rocks ever came to crumble into such a kindly soil God alone knows. Perhaps the fact that for so many ages men have loved this soil, have clung to it, cared for it, bequeathed it to their sons and with it the priceless qualities of fertility and beauty may account for its marvelous richness and beauty today. Look what a population it supports, more than 1000 to the square mile! And how well they are fed and housed and clothed, too! There is no dire poverty on the island, as there are no grand lords or millionaires. Down at the wharf as I write four steamers are being laden with potatoes for the hungry cities of England. Every day four or more steamers leave here. Besides potatoes they carry flowers, strawberries, tomatoes, grapes, apricots, nectarines, cream, butter, and now and then a little, angular, loose-skinned, mild-eyed deer-headed Jersey cow. Maybe that cow brought the islander as little as fifty pounds, but then she may have brought as many as 1000 guineas, and she has been and is worth the money? How comes this strange thing?

Jerseymen love their island. They have made it a bower of beauty. They love their cows, foster mothers to them; they have made them what they are, the mildest, gentlest, most unselfish creatures on four feet. It was necessity, necessity and loving care and thought, that made the Jersey cow. The island is small. It is much subdivided; farms are diminutive. A man who has four acres is well-to-do. He finds work there for all his family and hires some. He who has ten acres is a large proprietor and is full of business. One who has sixty acres, as one wealthy gentleman has, is plunged into a whirl of business that taxes his powers of management and commercial sense. The man who has so little land must manage it well. Really it is not a little. Consider, if you will, how much land an acre actually is. There are 160 square rods to an acre even in a flat county and much more in a hilly country. Each square rod is fed and weeded and planted and nourished, and if God is good, as He is here, and blighting frosts do not come (here it seldom passes 20 Fahr.), and if scorching heats do not come nor droughts, as they seldom do here, each square rod may yield amply to repay a man for a day's work, for more than that if planted in some things. There are no idle surfaces here. Every inch supports growth. The wall flowers make gay the walls and tops of houses and the ferns cling to the shady side of the old walls. The roadsides are lined with stone or earthen walls, crowned with tiny hedge sometimes. These earthen walls become a mass of gray, ivy, flowers. This is close cropped every spring, more than once, no doubt, and fed to cows or made into hay. Trees shade the roads, often making veritable leafy bowers, tunnels of beauty. You wonder at the trees; they must sap the land, but you see in the fuel sheds bound bundles of faggots cut from these trees, reserved for winter's fires. There is use even in the roadside tree. Orchards abound and they support at least two crops, the fruit on the tree, the garden or grass beneath. Weeds there are, no doubt, yet they are carefully destroyed; there is not room for them. Good growth fills at once the space they left vacant.

Cows are tethered in the orchards. Nowhere have I seen cows running at large, save on one steep and seagirt slope where a few heifers had their liberty. They are tethered because by this means of eating the grass there is no waste and they relish it better to eat it all at one time than to trample over it, eating the best today, the poorest tomorrow. After the cows have eaten over it if there is much left the man with the scythe makes that into hay for winter feeding. The cows are constantly in the care of man; they know him only as a kind companion, provider, the one who comes when the grass is out of reach to move them on a bit! They are incredibly gentle and winning, loving to reach out their soft noses to you and sample the taste of you with their tongues. At night they generally go to the barns out of reach of chill of rain or frost. There they are clean, comfortable, well fed, usually with cut grass, mangels, sometimes on the best managed farms with a bit of cake even when the grass is good. And they give the feed right back. Theirs is the unselfishness of the sublimest maternity. Nothing is stored up under the cow's own soft hide; instead it is turned into a limid nectar, sweet, delicious, tasting as though distilled from violets, roses and meadow grass, having in it no quality of the bestial, seeming of human origin and for human use alone intended, as, no doubt, it is, the cow having adopted the master and loving to give these copious milky streams to his use instead of the calf that she only remembers vaguely as coming into her life so very short a time ago. How came she to lose her selfishness, to store her food for her master's use in overflowing pails and gold crowned pans? It came about thus: the cow that stored her food beneath her skin for her private and personal use only was perforce sacrificed, eaten, her heifers discarded, this for centuries back, thus the good ones begat good ones. Where each is known, where but two or three or half a dozen are kept, each one is well known, and its mother and its grand mother. This is easy and you get to know after a time what to expect from a calf, from the mating of two families. You must know, too, that there are no other cattle in Jersey, nor have there ever been other cattle here, save many years ago a few perhaps from Gernsey, leaving little or no trace of their blood. Thus there has been no dividing of purpose, of effort; it has all been along the the line of how best to make the Jersey cow good. The greatness has cared for itself.

The Jerseymen are the most severe critics of their own cattle that I have ever seen. "That cow is no good," one of them remarks to you. "There is a bad cow; see her defective head; see that bad fore udder?" "That bull would be better off three feet under the ground, of a calf he saved. There is none of the self-destroying glorification of glossing over defects. You cannot gloss over defects where the test is performance; that is the test here. They calmly condemn as no good cows that our breeders would praise to the skies, and show pedigrees to back their assertions. These people keep the pedigree in the background, only producing it when performance needs explanation. And what an unselfish lot they are, to be sure. Mr. J. A. Perree pointed out one fine old cow rather thin in flesh but healthy as a wild deer. "You would have laughed, Mr. Wing, to have heard the comments of my feeder on this cow when we were trying to get her ready for the Island show. He said: 'What is the use of feeding a thing like that? Scarcely do you put it into one end of her when you just draw it out at t'other.'"

The Royal Jersey Agricultural Society pays a lot of prizes to bulls exhibited each year, very good sums of money indeed to encourage the breed and home breeders. The three-year-old and over bulls must come with their get to receive notice. All prize winning bulls must stand for public service at a comparatively low fee and to retain the prize money must show a book of a certain rather large number of cows at the end of the succeeding year. This tends to keep good blood in circulation. Not all of the cows on the island are good. Not all are registered. The unregistered ones must pass examination to be admitted to registry now.

Here in this tiny island, not half as big as an average small county, only as big as two of our townships in Ohio, supporting well 52,000 people, keeping about 12,000 cattle, not getting poorer but steadily richer, building new homes and restoring old ones, maintaining perfect roads, increasing fertility of soil, adding yet more perfection to the beauty of it. Is not that a lesson to use at home? What folly that we should call our land old, that we should move west in search of "more land!" We have too much now. We really need to learn to use what we have. We need to learn to take out the weeds, the scrubs, to make many blades of grass grow where are now but few, to learn to love our land as these Jerseymen do and then shall come the kingdom.

Breeders of Jersey cattle in our country must have noticed how much prettier incurving horns the island cattle have than theirs. That is because breeders here see to it that the horns shall curve right. A heifer's horns, if they do not start out right, are fastened together at the tips with a bit of wire. As they grow they are drawn inward so as to take on the graceful curve. The wire is left in place merely while it is needed.

The calves do not suck their mothers. They are grown on skimmed milk instead and tethered out when a year old. They are never fat, but the pictures of health, graceful, soft-eyed, like fawns. Should they develop fat and become round and plump they would be looked upon with grave suspicion and little would be expected of them.—Joseph E. Wing in Breeders' Gazette.

SHEEP RAISING

The successful sheep feeders of later years have prospered simply because they have resorted frequently to the dipping tank. The parasites that sap the vitality of the sheep and produce the desease known as "scab" can be eradicted by intelligent dipping and in no other way. Nearly all of the leading stock yards of the country have conveniences for dipping sheep. No sheep are allowed to be shipped from the Chicago Stock Yards without being first thoroughly dipped. All of these precautions are important, but they do not reach the case.

The sheep feeder who relies upon dipping to eradicate mites and the eggs that produce scab will surely fail. It is well enough, perhaps, to dip sheep before they leave the stock yards, but if they are put back into infected cars for shipment, what has been gained? The wise feeder will build a "quarantine yard" on his farm, where he can put his Western sheep upon arrival, and they should be left in this yard until they can be thoroughly dipped. Nothing but new arrivals should be put in this yard. The feeder should not be satisfied with one dipping, but should dip again after five or six days have elasped. If Western sheep are taken to a farm for feeding, they should be kept separate from the regular flock until the dipping operation has been Live Stock World.

FOR SALE—At Chapman Place, SAN GABRIEL, CAL., 2nd-hand Gass tents, nearly new; condition excellent; very cheap. Also grade and thoroughbred Holstein calf, De Kol strain, by registered sire. Cows and calfs unregistered. Apply to

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

CONTAGIOUS ABORTION.

Editor Cultivator: Could you please tell me what will cure our cows from losing their calves. Our cows lose their calves when they are from three to eight months along.—Subscriber. Downey, Cal.

Every cow that gives birth to a premature calf should be kept away from the rest of the herd until the genital passages have been thoroughly disinfected, all diseased discharges have stopped and the afterbirth securely buried. A bull serving one infected cow will give the disease to healthy cows. One of the latest treatments for those already infected, is to make hypodermic injections deep into the muscles of the shoulder, 10 c. c of an oily solution of turpentine every three days during the period of gestation. The solution is made of one part turpinol to nine parts pure olive oil.

* * *

GARGET.

Editor Cultivator: I have a Jersey heifer that calved on the 29th of September (5 days ago); her udder is very hard. I think a very severe case of garget. Have tried kneading and rubbing; also bathing in warm dishwater, but it is no better. I fed her alfalfa and beets; her bowels are all right. Please tell me what to do in the case. —T. H. Stafford.

Continue your fomentations. Make a bandage with four holes in it for the teats that can be tied over the back to support the udder. Place wadding cotton between udder and bandage and keep this saturated with water as hot as the hand can stand for an hour at a time three times a day. Hand rub gently and milk frequently. After each treatment cover the udder with mercurial ointment mixed with an equal amount of soap and add a little extract of belladonna. Keep udder supported with bandage when not treating.

CARE OF THE HORSE.

The Cultivato has often called attnetion to the value of taking care of the horse, especially the work horse. So often farmers and drivers of heavy city wagons slight their horses, giving them no attention ot noon time, withholding water when needed and fod which should be supplied at regular hours. A horse neglected as to stable care, or feeding, soon plays out. so to speak, and becomes old and worthless when it should really be in its prime. A starved colt will never make a good horse because it will never reach its full development in size and quality. Many persons who have colts and neglect their feeding, wonder why they do not mature into stronger horses, it is because they are starved when muscle building is going on. Always recollect this fact.

A subscriber asks us why it is that there are so many crippled horses in the country. One answer to that question is to be found in the fact that there are so many poor horseshoers in the land. Every man who fails to make a go of it in other kinds of business thinks he can be a horseshoer. But he can't shoe horses. Half the por crippled-up horses we see are made so by poor shoeing. It is a shame, and we ought to be ashamed of ourselves for patronizing such blacksmiths.

In connection with the matter of caring for the horse remember if a horse breaks loose and eats his fill of grain do not water him, but give him a dose of oil. If he is watered the grain will be washed into the intestines, there to ferment and give trouble. The oil will clear him.

Salt your horse regularly, and as regularly look in his mouth and see if it is sore and inflamed from eating barley hay. If so the pricks should be removed from around the teeth and a solution of warm salt water applied with a soft cloth or spray to allay the irritation.

CHOICE OF THE BROOD SOW.

In picking out brood sows I may say that people differ somewhat in their ideas. A few general points which should always be considered are as follows: Select a sow of good height, depth and uniform width. Get one that stands well on her feet and legs. Size of bone and conformation of feet and legs is an all-important feature in the breeding herd. Do not select a sow that is too drooping in the hind quarters, as such an animal is almost sure to be crooked in her hind legs, and thus is likely to break down on the same. The greatest difficulty with our hogs at the present time is that most of them are lacking in length and depth of body, and have not sufficient bone to carry their weight. A short-bodied sow will not make as good a mother as a sow of medium or good length.

The tendency of all our breeds at the present time is to deteriorate in size especially to deteriorate in length of body and in size of bone. In addition to this, if you are breeding Chester White swine it is all important that you adhere rather closely to the breed characteristics.

Of course, the ultimate end of all our swine is the block, thus the fat hog type must receive due consideration. Too many men are breeding hogs for fancy color markings, shape of ears, head, etc., rather than because they have indications of returning profit.

FEEDING HOGS.

Nothing has yet been found which fills the bill so well as a ration of which the basis is skim milk in conjunction with finely ground oats or barley and shorts. All these are flesh formers, says Up-to-Date Farming. Barley is a fat former. A very satisfactory mixture consists of finely ground oats 5 parts, finely ground barley 2 parts, shorts 2 parts, and oil meal 1 part.

Provide private runs for the pigs, in which place a shallow trough containing a gruel made of skim milk or buttermilk and the meal mixture. Start with shorts, adding the coarser meals as the pigs become older. No grain should be fed until the pigs are three months old. By this treatment, coupled with plenty of exercise, they develop good, healthy frames.

In weaning the common method is to shut the pigs up and let the sows go out in the pasture. Then the music begins. Better have a feeding floor adjoining the hog house. The feeding can be done here. Shut the sows in on this floor and allow the pigs every access to them. Feed the sows all the oats they can eat; give them all the water they can drink. The pigs are fed all they can eat. They go in and can get to the sows. By the end of a week the sows will be dry, and the pigs so disgusted going in and finding nothing that they'll just quit. You will find by the end of the week not a pig will go near its mother. You can turn the sows right out to pasture with the pigs and there is no more trouble. This is not a theory, for it is a very easy thing to dry a sow by feeding nothing but oats on a dry floor, and letting her have plenty of water.

WHICH ROAD?

If you could go back to the forks of the road;
Back the long miles you have carried the load;
Back to the place where you had to decide
By this way or that through your life to abide;
Back of the grieving and back of the care,
Back to the place where the future was fair—
If you were this day that decision to make,
O, brother in sorrow, which road would you take?

Then suppose that again to the forks you went back,
After you'd trodden the other long track;
After you'd found that its promises fair
Were all a delusion that lead to a snare—
That the road you first traveled with sighs and unrest,
Though dreary and rough, was most graciously blest,
With balm for each bruise and a charm for each ache—
O, brother in sorrow! Which road would you take?

—[Nixon Waterman.

BILLY AND THE EAGLE.

His head appeared very much too large for anything about him except his mouth and voice. The former feature was the first to engage one's attention and the latter was as hoarse as the croup.

His complexion was a dark Payne's gray and the blue-black skin hung in wrinkles around his withered neck, but was tightly stretched over his rounded abdomen. He was as naked as the brass Diana on the top of the Madison Square Garden and as blind as love.

His legs were too long and too weak to support his aldermanic body; but we must not blame little Billy for these peculiarities; he was born with them; he was only an orphan baby crow.

The crib in which he reposed was a work basket, his mattress was dry grass and his coverlet a rag of red flannel; however, the basket was more comfortable than the nest in which he was born and the flannel was as warm as an embroidered quilt.

Billy was no bottle baby, but he was very fond of raw eggs which his foster father, Dick, knew how to crack so that the contents could slip slowly into the great gaping mouth of the little crow.

After Dick had fed him, Billy would nestle down in his soft bed and sleep until next egg time. Sometimes Dick's baby sister Deborah would creep to the crow's basket.

Her first experiment was to try and put the bird in her own mouth. This proved a failure, but she was more successful in her next experiment, and she amused herself by picking up buttons and other small objects which came handy and dropping them into the red mouth of Billy.

Why these things did not cause the death of the crow is a mystery possibly explained by the habit that the young bird had of flirting distasteful objects from his mouth with a quick twist of his head.

The real result of these attentions was the gradual growth of a feeling of affection between Debby and Billy, hardly surpassed by the bond of devotion which bound Dick and the crow together, making them almost inseparable companions.

Long before it was the proper time for a young bird to leave its nest Billy would come sprawling and staggering from his basket to meet the baby girl, and, seizing the hem of her pinafore, would hang on and squawk while Debby, screaming with delight, would scramble over the veranda floor on all fours as rapidly as her hands and knees could carry her.

Debby still was a baby and had but just learned to walk when Billy was a handsome, full-grown, glossy black crow. By this time Billy appointed himself private detective in plain clothes and personal bodyguard to the little girl, and woe to the stray cat, dog or barnyard fowl that approached too near little Debby.

The innocent little garter snakes that timidly wriggled through the grass to the feet of Debby never failed to lose their heads and rest their bones inside of Billy Crow.

Dick would never harm the pretty little insect-eating snakes, or any other wild creature. He loved the trees, the sky and the air; the birds were his personal friends.

Dick knew where all the people of bird-town lived from the kingbird in the tall buttonwood tree to the sparrow in the clover. Billy Crow also knew the inhabitants of bird-town; but it would not have troubled the conscience of the crow to eat the robins eggs and the young catbirds at a meal and wantonly destroy their little nests.

If he refrained from so doing it was possibly because he always had enough to eat at home, or perhaps Billy thought that the inhabitants of Birdville belonged to his young master. Billy Crow might steal from any one else, but he never was guilty of robbing Dick, and even such tempting objects as Dick's bright glass marbles were deemed sacred by the crow.

The other birds always looked with suspicion at Dick's black companion; and although they learned to trust the boy, they never failed to scold and often to attack the crow.

The beautiful scarlet tanager would cry "Chip jarr, chip jarr!" whenever he saw Billy, and the gorgeously colored oriole, as he flashed in the sunlight, singing as he flew, would suddenly become silent at the sight of the crow; but when the kingbird erected his war plume Billy would have business to attend to which necessitated his presence directly around his master's feet.

A fierce war eagle, with great hooked bill and tremendous spread of wings known to Dick as Uncle Sam, lived in the mysterious country on the far side of the little lake in front of Birdville.

One day Dick and Billy saw the great bird at Rock Cabin Cove on the opposite side of the lake waiting for an opportunity to rob the industrious fisherman osprey. Billy ruffled up all his features, dropped his head and began to walk around his master's feet talking and laughing in low, guttural tones as if something greatly amused him.

A moment later the fishhawk fell with a splash into the water, disappearing from view, only to reappear again with a big stupid carp in its hooked talons. Uncle Sam launched himself, and, sailing over the back of the frightened hawk, demanded the fruits of the latter's labor.

The loud whistling protest of the hawk could be heard plainly appealing for help, and in a moment more Billy was flapping his black wings over the robber eagle's back. By his loud hoarse "caws" one could tell that he was having fun with Uncle Sam and teaching him how it feels to be the under one.

Soon the eagle was glad to leave the osprey and seek the shelter of the dense woods on the other side of the lake by the abandoned quarry. Perched upon the boy's shoulder Billy then told all about the affair.

"Caw," says Bill, "caw. Sam is nothing much. I saw Long Legs, the blue heron, at the leaning maple, whip him—Sam can't fight a litl bit 'nless he has everything his way—caw, caw!"

Nobody but crows and Dick understands crow talk, but Dick understands all the wood folks' languages.

All unknown to her parents and Dick, little Debby had toddled after her brother to Birdville. Wearied with the long walk the baby girl now slept peacefully among the blue flowers of the lupine, near the sparrow's nest.

The impertinent and noisy bluejay came chattering over to see why Debby was there, and incidentally to rob a nest or two by the way, but the kingbird raised the hue and cry and drove the gaudy bandit away and as the jay disappeared down the tote road his mocking, high-keyed voice was heard to cry:

"Got 'im, got 'im, I've got 'im!"

"Who? Who?" asked the barred owl, aroused from his day nap by the tumult.

"Phoebe," mournfully replied a faint voice; and Dick said to Billy:

"I hope not."

But the crow was not there to hear him. Just then the boy heard his friend using most unprintable language, betokening both rage and great excitement.

Seizing a club and hastening to his friend's assistance, Dick was horrified when he saw Uncle Sam vainly trying to lift a white object from the ground, while Billy was making a frantic attack upon the eagle, aided by the kingbird and humming bird.

With one bound the boy landed on the battle ground and with a mighty swing of his cudgel he laid the baldheaded robber prone among the flowers. The next moment he had gathered his little baby sister in his sturdy young arms. Her white pinafore was torn to shreds, but she was unhurt.

"Poo Billy, him fight naughty big bird, poo Billy," lisped the little girl.

Poor Billy, indeed! There he lay, his beautiful black wings outstretched, moving with the tremor preceding death. Billy the crow had been killed by the same blow which slew the eagle.

In vain did Dick use every means in his power to resuscitate his friend and comrade. The bird was past help.

A little mound among the lupines marks the spot where the quaint and lovable soul was freed from the black body which is buried there. A shingle serves for a headstone, and inscribed thereon is the legend:

Here Lies Billy the Heroe.
He Was My Best Friend an'
He Licked a Eagle.

—New York Sun.

RAILROAD ENTERPRISE

The California Northwestern Railway Co. have had a very successful season with their Fish Hatchery and Spawning Station work, at Ukiah and Willits in Mendocino County. The backward spring retarded the seasonal run of trout at their Spawning Station about one month later than usual, and fears were entertained that the catch would prove very light, but the copious rainfall during the early part of March changed conditions materially, and resulted in a very successful catch of eggs, amounting to over a million. The fish taken at this station are of the "Rainbow" variety, locally called "steel head" and are considered among sportsmen to be the finest variety of trout on the Pacific Coast. Being indigenous to these waters they are already acclimated to their environment and grow more rapidly and make more vigorous fish than any of the introduced varieties; under favorable conditions of food and water usually attaining a growth of eight inches in twelve months from the egg and make good sport for the angler the following season from their planting.

The work of the Spawning Station consists in the capture of the wild fish on their way to their spawning beds, relieving them of their eggs and putting the eggs through the eying process; they are then transferred to the Hatchery at Ukiah, where their incubation is finished and the fish is reared until they are large enough to transfer to the streams. This work of distribution and the large number of streams stocked this season assure the lovers of sport an abundant field in which to test their prowess when the season opens next spring.

BREAK, BREAK, BREAK.

Break breag, break,
On thy cold gray stones, O sea
And I would that my tongue could utter
The thoughts that arise in me.

O well for the fisherman's boy
That he shouts with his sister at play!
O well for the sailor lad
That he sings in his boat on the bay!

And the stately ships go on,
To the haven under the hill;
But O for the touch of a vanished hand,
And the sound of a voice that is still!

Break, break, break,
At the foot of thy crags, O sea!
But the tender grace of a day that is dead
Will never come back to me. —Tennyson

OUR HIRED GIRL.

We have parted with our hired girl, Leone.

Leone was tall and gaunt, and red-headed and eccentric. During those smoky hot days early in July, we missed her from the house a good deal, and when we watched her we saw her going to the stable carrying a palm-leaf fan. Upon questioning her she said that she belonged to the Society for the Prevention of Cruelty to Animals, and she considered it her duty during the hot spell to fan the horse. We subsequently discovered that she was giving bromide of potassium to the Chittagong rooster to cool his blood and that she had had a mustard plaster on Jones' cow (next door) for two days.

She was partial to medical practice, but a little uncertain. The first time Leone took a seidlitz powder in our house she drank one powder first and then drank the second one. She said, after she became calm, that she felt as if somebody was holding a Fourth of July celebration in her thoracic duct. And on the occasion when she drank Mrs. Adeler's liquid shoe blacking under the impression that it was paregoric for her cough, she expressed a fear that it would work through the pores of her skin and convey to strangers the impression that she was of African descent.

I found Leone upon the lawn one day, stooping down, hard at work at something. I went to observe her. She rose with a pair of button-hole scissors in her hand and she said she intended to mow the grass.

"Leone," I said, 'how many blades of grass can you cut in a minute with those scissors?"

"About two a minute.'"

"Well, Leone, there are four acres of grass with two or three thousand billions of blades to the acre, so you will probably not finish the job for nearly two thousand years, perhaps you'd better knock off and get supper ready first."

She said perhaps it would be better.

She had a way of trying to beat up eggs with a gridiron that was one of the most interesting sights I ever saw. The eggs would be in a small bowl, and she could reach them only with a small corner of the gridiron, but she threw a heartiness and enthusiasm, a whole-souled earnestness into her manner of brandishing the gridiron which was poetry merely to look at. There was an originality, too, about her method of making griddle cakes. When they were done enough on one side she always turned the griddle over, instead of the cakes, and when the cakes dropped into the fire she would seem as much surprised and hurt as if a personal friend had insulted her. I think she never understood exactly how it was. She appeared to have a dreamy kind of an idea that the laws of the universe were suspended, somehow, whenever she baked griddle-cakes.

That wet Monday we had early in June she was unable to dry her washed clothes in the open air, so she got my son Ivanhoe's magic lantern and turned the reflector on the wet sheets, under the impression that the light would dry them. She told Mrs. Adeler that if she had a locomotive headlight she would dry the whole wash in an hour.

Her greatest culinary sensation, however, was produced on the day she tried to make bean soup out of coffee berries, and to sweeten the cup custard with cream of tartar.

Leone had a good deal of mechanical ingenuity for a hired girl. She rigged up a series of wires and bell-crank levers, running from the garret to the kitchen, by which she could bolt her sleeping room door and unbolt it without going up stairs. (She always acted as if she had millions of dollars' worth of diamonds in her trunk, and was afraid of being robbed.) But the arrangement was defective in some particulars. She would pull the wire and unbolt the door before going up stairs. Then, as soon as she left go of the wire the door would bolt itself again, and when she got up stairs she couldn't get in. She made fifteen trips up and down stairs the first night trying to get the thing fixed, and finally she slept out in the entry.

Her "coal-scuttle hoister" was a bigger thing still. There used to be a dumb-waiter running from the kitchen down into the cellar, but I had it taken out. Leone bought a rope and put it over the pulley, which was still standing. Then she put a large box on each end of the rope. Her idea was to fill one box with loaded coal-scuttles and then to pull them up by standing in the other box. The first time she tried it she was pained to find that she would have to go up stairs to get in the empty box. But she did so, and the scuttles came up all right. However, then she descended, with the other box, she stepped out and scuttles came down again with a rush. Mrs. Adler's aunt thought there had been an earthquake. Leone went up stairs again and descended a second time in the empty box. When she got down she was afraid to get out or to let go; and she sat here unill morning trying to figure out why the machine wouldn't operate. She would have been there yet if I hadn't called her to get breakfast.

Leone left us next day. She said she was going to Italy to study to be an opera singer. I have doubted the story since we missed eight teaspoons and three pounds of sifted sugar. But I would give my last dollar to see Leone trying to play the part of Norma. A red-headed Norma fanning a horse and stirring eggs with a gridiron would create a sensation.—Mrs. Adler in the Hearthstone.

WEATHER AND CROPS.

The Weather bureau reports the following bulletin of crop conditions for the week ending October 5: Light rains fell in nearly all sections of the State last week. Heavy frosts occurred on the lowlands in some counties. As ample warnings were given, there was but slight injury to raisins and deciduous fruits on the trays, but late grapes were somewhat damaged. The first crop of raisins is nearly all secured and the second crop is being rapidly gathered. The grape crop is unusually heavy in many sections and the grapes have a high percentage of sugar. Wineries are running at full capacity, and the product is reported very satisfactory. Late reports from the Santa Clara valley indicate that the season's output of deciduous fruits is considerably below that of last year, but the quality of nearly all varieties is much better than usual. In other districts large crops have been gathered and the fruit is also of superior quality. Prunes are still on the trays in some sections; fruit is of excellent quality, but the yield in some places lighter than expected. A large crop of apples is being gathered, but the fruit has been somewhat damaged by codling moth. Oranges are in good condition and developing rapidly. Walnuts are of good quality but the yield is light.

Beans were slightly damaged by the recent rains and the cloudy weather has been unfavorable for curing; the crop will be about average. Sugar beets are yieldig a good crop. Corn picking and potato digging are progressing. Seeding summer-fallowed lands has commenced in some places.

SOUTHERN CALIFORNIA.

Generally cloudy and cool weather prevailed most of the week and light rain fell in some sections. Some damage has been done to beans and unprotected grain and hay by the recent rains. Fruit drying and raisin making are progressing slowly, and warm clear weather is needed. The raisin crop will be large and of superior quality. Oarnges are in excellent condition. Walnut picking is progressing; the nuts are very good quality, but the yield is light. Beans and sugar beets are being harvested. Late potatoes are doing well.

Gardena, Cal.

Recipes...

DELICATE PUDDING.

Tea-cup flour, large table-spoonful lard and pinch salt, mix thoroughly, then use water enough to stick it together. Roll to a thin layer, place in pie plate and perforate lightly with fork and bake until nicely browned.

Yolks of two eggs, two table-spoonsful sugar, large tea-cup sweet milk and flavoring desired.

Eggs and sugar beaten together, milk placed on stove until it boils, stir eggs and sugar into the milk then boil until thickens, and pour in the pie-plate. Spread thin layer of jelly on this, beat the whites of the eggs to a stiff froth, a table-spoonful sugar in eggs and flavoring same as before. Spread the latter upon the jelly and place in the oven, allowing to remain until frosting is slightly brown. This is one of the finest of desserts.

* * *

HUNGARIAN CABBAGE.

Butter a deep dish and line it with bread crumbs. Put into it a layer of chopped, partly stewed and drained cabbage; on this a thin layer of good sausage, then another of cabbage, seasoning each layer with pepper and salt to taste. The real Hungarian dish also has plenty of nutmeg added to each layer. The top should be bread crumbs, moistened with beaten egg. The whole is baked slowly two hours, covering half of the time, and sent to the table garnished with some leaves of herbs.

* * *

ROULADES OF BEEF.

Procure a tender piece of round, not cut in steaks, and divide into thin slices; pound them and spread each slice with chopped bacon, pepper, salt, and a little chopped parsley. Roll each piece up and tie with a string, then fry lightly in butter. When a good brown take them out, put into the fat a spoonful of flour, and stir until smooth. Add sufficient broth of some sort to make gravy, which season with pepper and salt. Put the meat, from which you have taken the strings, into the sauce to heat; add a few slices of lemon and serve hot.

* * *

STEAMED OYSTERS.

If shell oysters are used, save the liquid, and with it make a thickened sauce to pour over the oysters when cooked. Put the oysters in a shallow dish or plate and steam for five or six minutes. Place at once on small pieces of hot buttered toast, seasoning with salt, cayenne pepper and butter. Good enough without sauce.

* * *

SALLY LUNN.

One cup sugar, one table-spoonful butter, one cup sweet milk, two cups flour, tea-spoonful baking powder, two eggs. Sugar and butter creamed together, then add milk and stir thoroughly. Sift baking powder into the flour, and add eggs last, flavor with flavoring desired. Sauce to be served over the above. Heaping tea-spoonful butter, teaspoonful flour, pint boiling water, sweeten to taste, flavor same as above. Butter and flour must be thoroughly mixed, pour boiling water over the butter and flour and stir well, allowing to boil about five minutes. This sauce can be served over any cake or pudding.

* * *

EGG OMELETTES.

For a family of five use six eggs, table-spoonful flour, tea-cup sweet milk and pinch of salt. Eggs and flour must be beaten together. Fry on a hot griddle three table-spoonful of the above mixture at a time placed upon a griddle letting it cover surface in a thin layer. When brown, by means of a knife roll first from one side then the other until it is in a nice roll, proceeding in this way until all the mixture is used.

INDIANS OF THE SOUTHWEST.

Dr. George A. Dorsey's latest and best work. Complete and authentic; 225 pages; more than 200 illustrations, with maps showing Indian reservations and principal groups of ruins. Characteristic illuminated cover. Price 50 cents at book stores or of E. W. McGee, 200 Spring St., Los Angeles.

BEE SUPPLIES—G. G. Wickson & Co., 128 N. Main Street, Los Angeles, Cal.

BY ERNEST BRAUNTON, LOSANGELES, CAL.

FOR WINTER FLOWERS

It is none to early to begin the planting of bulbs for winter flowering, says Leonard Coates, and it is easily within the reach of all to have at least a moderate display of narcissus, tulip, or hyacinth, and they are very cheap, the San Francisco florists being forced to reduce their charges in order to compete with the large Chicago and Eastern houses who make a specialty of the mailing trade. Bulbs require a light, rich soil, well drained. They will not stand fresh manure, too much moisture, a stiff, compact soil, or one which bakes or is allowed to bake on the surface. The culture of flowering bulbs is very simple, but it is absolutely necessary to have soil and moisture conditions right. Most bulbs will do well enough in the ordinary soil of the Fresno gardens if it be handled right. And a great deal depends upon that little word "if." The ground being properly prepared by deep spading, the bulbs should be set firmly, and, according to their size, two to six inches deep. Some exception are noted, as with the tuberose, which should not be covered with more than an inch or two of soil, and which delights in a very rich and moist soil, which has been prepared previously by enriching with thoroughly decayed manure, and with the gladiolus, which, though preferring a lighter soil, should be covered with not less than four inches of soil, and even six. The gladiolus may be planted any time from September to April in order to get a succession of blooming, but the tuberose should not be set in the open ground before April or May, when the soil has become well warmed.

MULCHING

This is of vital importance in the culture of bulbs in this climate. It is acknowledged everywhere to be necessary in making the soil act as mulch by stirring deepling before the surface bakes after watering or rain. But, in a climate where hot, sunny days are the rule for many months, it is advisable if not essential that a mulch of well-rotted manure or other litter be used in addition to stirring the soil. This should be scattered over the beds three or four inches deep after bulbs are planted.

WATERING

All this is of little avail, however, unless watering is done more carefully. Whenever possible, plants and shrubs in the garden should be watered by a thorough soaking occasionally by means of little furrows made with the hoe, in which the water is allowed to run. When sufficiently soaked, and before a hard crust has time to form, with a forked hoe, hand cultivator, or even rake, go over the surface and thoroughly loosen the soil. This need not be done more than once a week, or less, so that the quanity of water used would not be one fifth of what is thrown on the ground through the nozzle, as this is done daily, most of the water running off the surface, doing little good, and rendering the soil less productive every year. Go to a successful vineyardist and ask him why he "cultivates" ground after a rain or after irrigation; what would happen if he did not cultivate; and would he not be better off if he cultivated still more or deeper? Where it is not practicable to water plants in this way, let it be done by means of a nozzle throwing a fine spray, and which is fixed to some standard in the ground.

IN POTS.

Small pots should be used, preferably a 4-inch; the soil should be a compost of well rotted manure, leafmould, and sand. The bulbs are planted so that the top is just visible, they are well watered, put away in the cellar, or some dark, cool place for a month or six weeks, when they will be rooted; then brought to the light, but not direct sunlight for several days, and kept moist, but not wet. Hyacinths are better planted singly, but fuchsias, tulips, etc, may be planted in groups of three to five. Early Roman hyacinths should be planted in clumps. This last and some of the narcissus, such as Paper white and Trumpet Major, and Single Tulips are among the best for early flowering, and may easily be in bloom before Christmas.

Beds of hyacinths in assorted colors are always popular. To have the best effect, named varieties should be selected, and arranged acording to color. Those should be planted in the open ground during October and November, about four inches of soil covering the top of the bulb. With hyacinths as with tulips, care must be taken that they do not get too much water, especially before they have started to grow. When the stalks turn yellow, the bulbs may be taken up, cleaned of old skin and dirt, and put away in paper bags for next planting time. Narcissus, Roman hyacinth, many Liliums, etc., may be left in the ground, if the surface be kept loose and and well mulched.

* * *

But of all the common garden bulbs the Narcissus is in many ways the most satisfactory. The varieties are almost unlimited; such as Paper White, Albus plenus odoratus, Trumpet Major, Incomparable, Bulbocodium, etc., being a continual source of pleasure. Planted in clumps in good soil in shaded locations in the shrubbery or under trees, they are even a surprise at the return of spring.

BUSINESS NOTES.

The Imperial Investment Co. has some most atractive propositions regarding Imperial lands. Their specialty is government lands and water for them. Their office in Los Angeles is on Third street, No. 218, also at Brawley.

* * *

Those who have not yet sown the peas or other green manuring material should get a move in. The warmer weather gives a good start to the young plants and fits them for strong growth in the cooler shorter days. The Germain Seed Co. has the seed of a quality the best in bulk to suit the largest planter.

THINK IT OVER.

When you get sick you don't send for a piano tuner, do you?

When your horse has the colic or your cow has been snake bitten you don't summons a plumber, do you?

You're right you don't, but do you take the proper care of your poultry by keeping them in clean comfortable quarters and getting at the seat of their trouble when they droop around, mouth and throat ulcerated, mucous discharging from the mouth, eyes sore and swollen? What is the trouble? Roup! What do you do for them?—Let them die or kill them? A great many do, but how silly it sounds to hear men and women with intelligence report such practice.

Now, listen. We have something "that does the business." What kind of "business" you may wonder. The kind that eradicates roup and cholera in poultry and puts in proper condition that the raiser may realize a profit therefrom.

Sick chickens are a nuisance. Get right on the subject and stay right.

Palmer's Poultry Powders cures roup and cholera, and are sold under a guarantee. $1.00 per box—less than the price of two good chickens, if you let them de or kill them.

The Chino sugar factory paid out $9,000 last week to the farmers for beets delivered during the month of August.

THE "BOSS"
TREE PROTECTOR
Made of Yucca Palm

Is cheap, durable and quickly put on the tree. It prevents Rabbits from destroying your trees. A sure protection against frost, sun-burn, grasshoppers or dry winds. can be easily removed; will last for years.

Send for samples.

IS BEAUTY NECESSARY TO WOMAN.

It is amusing to hear a Frenchman seriously contended, as the Marquis de Castellane recently did in the Times, that beauty is the all-important attribute of woman. This gentleman not only believes that beauty has been a great factor in woman's life, but that it always will and always should be the most important thing for her to consider or for others to consider in regard to her.

That beauty has been, to a great degree, the controlling force in woman's life and in the life of animals, both male and female, throughout the ages, is unquestionable but is the human race never to lift itself above the animal level?

As a matter of fact, it has already made great headway in this regard. The sense of beauty has not been lost. No good thing is lost which the past has found useful to its advance. But while not ignoring or becoming indifferent to appearance in either man or woman, other attributes have taken prior place among a large and growing part of society.

Why is it that mere regularity of feature and attractive coloring is not considered by the majority as necessarily beautiful? Why is it that the face with no expression is not regarded as beautiful by any but the ignorant and careless? Merely because other things than beauty have come to be considered as of first importance, and unless beauty is of a kind that reveals these other qualities, it is not regarded as beauty.

What is it that goes to make up expression? Intelligence, enthusiasm, vivacity, kindliness, force, high purpose—all of these things are seen through transparent surface features and make even a plain face beautiful, and without these or some of them no features can have true beauty.

Why is it that American women are universaly regarded as chief among women in attractiveness? Is it beauty alone? Surely their features are not more perfect, if as perfect, as those of women of other countries. It is the qualities of mind and character back of face and form that have given them the prestige recognized everywhere. More and more the world will grow into the standard that has moral and intellectual traits far above mere external attributes of form.—Denver News.

Good nature depends upon good health, good health depends upon good nature. Therefore, cultivate both equally. Being good-natured when one's liver is out of order is a tough pull, but a mental clubbing is quite as effective as is the eating of oranges and apples, and the slowing up on meat and butter and sugar, getting plenty of fresh air and exercise, and applying plenty of water, both externally and internally. Jerome K. Jerome says (in "Three Men in a Boat"): "The most efficacious cure for liver complaint is a clump on the side of the head," and he is dead right. Sail into the oranges and lemons, but instead of coddling your liver, and bewailing your fate, just get to work and "do something," both mentally and physically. Mental exercise, of the right kind, is just as necessary as physical exercise and fresh air, and bathing and food. And it is by "wrestling with destiny" that one learns to live—learns to judge of the things of this world that are really "worth while" and worth working for. When the sun shines, get out and soak yourself in it (both literally and figuratively) and store up enough warmth and good cheer to last you through the stormy times that may come again. And do not be stingy with your store of good cheer—once absorbed, it grows with use, and the more you give out to all the world, the more you will have, both for yourself and other people.—Ex.

THE GIRL TO MARRY.

Some marry just for beauty
Some coldly wed for wealth
Some make a requisition
For a girl in perfect health.
Some men prefer a woman
Wise enough to write a book.

After several weeks of controvesy the local prices of wine grapes at Woodland have been established, they are: Zinfandels, $13.50; Sultanas, $12; Muscat, $9; Tokays, $8.

THE HOME BEAUTIFUL.

There is much said nowadays about the elevating, purifying and far reaching influence of woman in the world as regards commerce and the professions; but woman needs the sheltering sanction of home for the highest, noblest and most sacred possibilities of her nature. A quiet home is the arena in which a woman may radiate sweet, gentle and helpful influence, ennobling generations that "rise up and called her blessed." There is no woman, however poor she may be, but can leave behind her the greatest things on earth—a noble character and transmit that character to each of her children. Misfortune and poverty may have been her lot, but if she succeeds in making a true home for her family she will have exerted the fullness of her power.

Woman, will always be the home maker—a man cannot make a home—corporations cannot make homes—a house of itself cannot be a home, be it ever so grand or comfortable. With the wisdom of her early training a woman will make a home for her husband and children, as her mother did before her. She will enlarge her horizon; train her faculties; develop her character and infuse into the midst of her family that heaven-born gift—a true mother's love.

It is a good. it is a blessed, it is a great thing to be the maker of a happy, peaceful home. The home is not endangered by the cry "Equal suffrage" and the rights of women to serve her day and generation in the busy mart and the professions. New elements of grace and beauty she will bring with her in trade, the halls of government, religion or wherever her ambitions and powers carry her, but the home is her God-given realm in which she fills the highest and best offices possible to mortal. Woman as home-maker is of greater importance than any service she can render as a wage-earner, as a teacher, as an artist, or any avocation she may pursue, in which her sister woman is making her mark.

The remembrance of our childhood's beloved home comes to us in after-life as a benediction; its teachings are the best safeguard against the world, the flesh and the devil. The prayers learned at the mother's knee are never forgotten and their memory remains green after the scorching fire of temptation and worldliness.

The woman on the farm can create a perfect home far easier than her urban sister; farmers and their families must of necessity spend more time in their home on account of its insular situation, and therefore, a mother's influence has more sway as is has fewer counter-currents.—Maxwell's Talisman.

CAPABLE.

A very jaunty-looking applicant for the position of stenographer and typewriter in the office of a gentleman in public life was told that it would be necessary for her to be a good speller and to have a thorough knowledge of grammar. She gave proof of her entire proficiency by saying, "Well, I have always knowed how to spell, and when it comes to grammar I don't take no back seat for nobody, I don't.—September Woman's Home Companion.

Seventy per cent of the failures in life are caused by delays, for some reason or other—the habit of putting things off, instead of acting on the principle, "Never put off until tomorrow what you can do today," and when the tomorrow comes the opportunity is gone or the enthusiasm has grown cold. Act on the injunction, "Whatsoever your hands find to do, that do with all your might." It is true that Procrastination is the thief of time, and that tomorrow never comes.—Ex.

The wine grape is being gathered in Southern California, and the crop promises to be fully fifty per cent over that of 1902. The season has been a most favorable one. The prices being paid by winery men run from $14 to $22 per ton.

MARGERY'S GUESS.

"Please dive me ten cents' wurf of stamps,"
Said she, with trepidation.
"All right, my child"—the stamp-clerk smiled,
"Of what denomination?"
That great word the little miss
For just a moment daunted—
"My mamma is a Mefodis.
I des' 'at's what she wanted."
—September Youth's Companion.

WHAT WE READ.

Mr. Howells said in "Silas Lapham" that our civilization came mainly through books. Nothing could be truer. It is but a modicum of culture that we get by open precept or by word of mouth. This being the case, nothing is more important than the sort of books we read. We should see to it, above all, that they be healthy; above all, sane. Books which tend to pull down one's faith in life or in mankind are not for us. Sweetness and light is a thing to have in front of us. We want our civilization to tend toward these things, and we will do well to test our reading by them.—September Woman's Home Companion.

A teacher was explaining to a little girl how the trees developed their foliage in the spring-time. "O, yes," said the little miss. "I understand; they keep their summer clothes in their trunks."—Credit Lost.

Here's to the ships of the ocean;
Here's to the women of the land:
May the former be well rigged,
And the latter be well-manned.

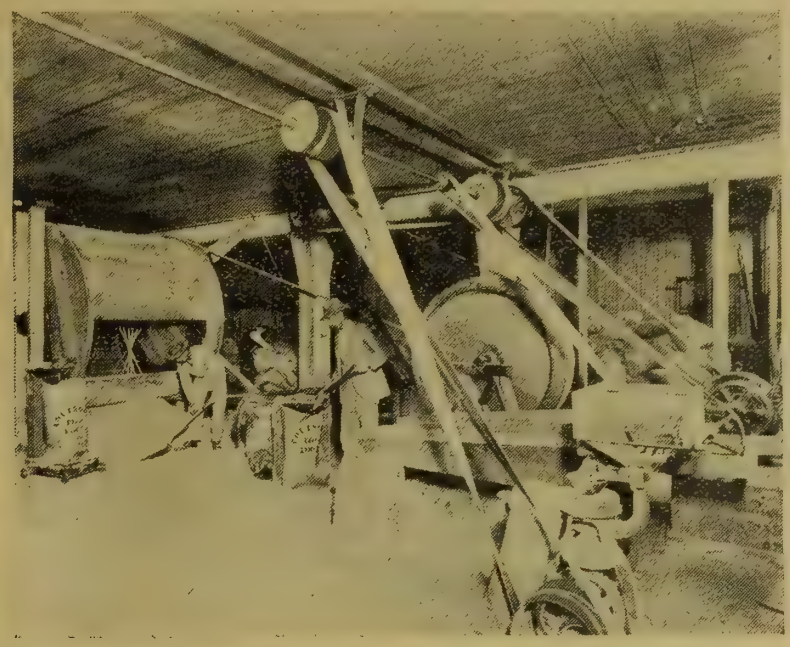
Coulson's Egg and Feather Food

Makes Hens Lay, Keeps Hens Strong and Healthy, Makes Feathers Grow. It costs a little more to begin with, but it is a richer and more nutritious food and is the cheapest in the end. Do not neglect to feed this food during the moulting season.



COULSON'S EGG AND FEATHER PRODUCING FOOD

Is especially prepared to feed to moulting fowls, and it contains all the elements necessary to make the feathers grow, Coulson's Egg and Feather Food is not a fattening food, but a food that makes muscle, bone and feathers. A hen may be extremely fat and yet not have the vitality to stand the strain of growing new feathers, and many hens die during the moulting process. If you want your hens to complete the moulting process quickly, and to have a beautiful, glossy plumage, just feed them all they want—a full meal at least once a day (and sometimes twice a day)—of Coulson's Balanced Ration Egg and Feather Producing Food.

One man says that this year he has been feeding his hens Coulson's Egg Food and the hens have laid more eggs than ever before. Another man who has been feeding Coulson's Egg Food for a year says that it makes the hens lay over the fence and lay everywhere, and you can gather the eggs by the basketful wherever you go. It's good for laying hens, it's good for the molting hens, it's good for the growing pullets.

READ TESTIMONIAL

Santee, Cal., Sept. 17, 1903.

The Samson Iron Works, Stockton, Cal.

Gentlemen—I bot. two 4 in. centrifugal pumps off you last spring. I am pumping over the capacity with both of them. One of them I am exceeding the capacity over 33⅓ per cent, pumping about 106 inches, also which we speeded up to 125 inches, causing the manager of a large Los Angeles engine house to say it gave the best results that he had ever seen. Being now a Californian I am certainly glad to be able to commend home manufactures. Very truly, H. D. WILLIAMSON.

SAMSON IRON WORKS STOCKTON CALIFORNIA

Los Angeles Markets.

LOS ANGELES, October 8.

The conditions surrounding the local markets are varied. Vegetables are considerable higher owing to the scarcity with which they come on. Sweet potatoes are in good demand, prices ranging from 2 to 2¼, according to quality.

Other vegetables coming slow tend to higher prices.

Spring chickens are quite plentiful, but hens are scarce.

The grain market is quiet.

San Francisco Markets.

Dairy.

San Francisco, October 8.

Butter buyers operated cautiously in the resh lines of goods yesterday, continuing to hold their orders down to a minimum, and, as there was some accumulation on the market, an easier tone developed and fractional declines were noted.

BUTTER—Per lb:

Creamery, evtras	.30
Creamery, good to fancy	.27 @29
Dairy extras	.25 @26
Dairy choice	.21 @24
Store	.18 @20
California storage	.24 @26
Eastern Creamery	.23 @25

CHEESE—Per lb:

Cal. Creamery, mild new, choice	.13½@14
Young America	.14 15½
Eastern, New York Cream, Cheddars and flats, new	.14½@16

Eggs and Poultry.

There was a slight rise in the price of eggs but not so much as had been anticipated, owing to the liberal shipments from the East during the week.

The following were the quotations yesterday:

EGGS—Per doz:

Ranch, selected large	.40
Ranch, good to choice	.36 @39
California Storage	.26 @29

POULTRY—Old Roosters, per doz, $4.50@5.00; young Roosters, $5@6; Fryers, $4@4.50; Broilers, large, $3.25@4; small, $2.50@3; Hens, $4.50@5.50; Ducks, per doz., old, $5@6; young, $5.50@6.50; Turkeys, young, per lb., 20@23c; old, per lb., 14@17c.

Fruits and Vegetables.

The vegetable market showed little change this week. The greatest change was noticed on potatoes. Heavy shipments of Oregon Burbanks had a tendency to lower prices somewhat. On the whole the market showed little change on staple articles.

APPLES—Per box, common to choice, 30@85c; fancy, $1@$1.25.

PEACHES—Per box, 35@65; large open boxes, 50@75; bulk, per ton, nominal.

PRUNES—Per box or crate, 50@85c.

FIGS—Per box, 55@$1.25.

CANTALOUPES—Per crate, $1.25@2.00.

GRAPES—Isabella, large box, 65@85c, as to variety; Wine Grapes, per ton, Zinfandel, $17@23.

POMEGRANATES—Per box, 65@2.25, as to size of box.

QUINCES—Per box, 35@60c.

BERRIES—Per chest: Strawberries, Longworth, $4@$7:; large varieties, $7@9; Raspberries, $3.50@$5; Huckleberries, per pound, 7@9c.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal; Valencias, $1.25@3; Lemons, $1@3; extra, $3.50; Grape Fruit, $1.75@2.25;; Limes, $4.50@5.

VEGETABLES—Tomatoes, per box, 20@40c.

POTATOOES—Per ctl: River Burbanks, 50@80c.

Dried Fruits, Nuts, Etc.

The San Francisco Chronicle says::

The market for the leading variety of dried fruits continues bouyant under a vigorous demand and full outside figures are easily obtained for the top quality of offerings. The greatest interest is still centered in prunes and the demand is strong, with buyers keenly endeavoring to close deals well up to full rates, but sellers are indifferent in parting with their holdings.

APPLES—Evaporated, 5@6c; Sun Dried, 3½@4c.

APRICOTS—Royal, fancy, 9½@10; choice, 8@8½c; Moorparks, choice, 9@11c.

PRUNES—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

NECTARINES—White, 4@4½c.

FIGS—White, 4@5c; Black, 5½c.

NUTS—Per lb: California almonds, hard shells, 8@8½c; soft shells, 10@11c; paper shells, 11@12c; standard 9@9¾c; Pecans, 11@13c; Walnuts, soft shells, 12½c; do No. 2, 10½c.

HONEY—New Comb, per lb., White, 12@13c; Light Amber, 11¼@12c; Extracted Water White, 6½c.

Live Stock.

The Live Stock market displayed about the same degree of energy that was shown last week. Former prices obtained generally.

CALVES—Light, per lb., 5@5½c, gross weight; heavy, 4@4½c, gross weight.

CATTLE—No. 1 Native Steers, 8@8½c; second quality 7½@8c; thin Steers, 6½@7c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrikage.

SHEEP—Per lb: Fat Wethers, No. 1, 3½@4c, gros weight; Ewes, oN. 1, 3¼@3¾c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5s per lb, live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 140 lbs. and over, 5¾c; weighing under 130 lbs, 5¼@5½c;; weighing 260 to 305 lbs, 5½c; rough heavy, 4½@5c.

FRESH MEATS.

There were no marked fluctuations in values for Fresh Meats this week, and, beyond a slight improvement in the demand, stimulated by the recently reduced rates, there was no material change in the general situation.

BEEF—Per lb.: No. 1 Steers, 7@7¼c; do, second quality, 6½@6¾c; No. 1 heavy, 7@7¼c; do, second quality, 6½@6¾c; No. 1 heavy, 7@7¼c; thin, 6@6½c; No. 1 Cows and Heifers,

6@6½c; second quality, 5½@6c; thin, 4@5c.

VEAL—Per lb.: Heavy, 6½@7c; light, 8½@9½c; poor Calves, 6@6½c.

MUTTON—Per lb.: Light Wethers, 8@8½c; do, Ewes, 7½@8c; heavy Wethers, 8c; Ewes, 7½c.

SPRING LAMB—Per lb., 9@10c.

DRESSED HOGS—Per lb., 8½c.

Hay and Feed Stuffs.

HAY—Prices on New Hay, per ton: Wheat, $12@16; Wheat and Oat, $12@15; Oat, $11@13.50; Barley, $9@12.50; Clover, $9@10.50; Alfalfa, $9.50@12; Stock, $8@10.50.

STRAW—Good to choice, per balé, 45@60c.

FEED CORN MEAL—Choice grades, per ton, $31@32.

MIDDLINGS—Per ton, $25@29.

BRAN—Per ton, $21.50@22.50.

CRACKED CORN—Choice quality, per ton, $31.50@32.50.

WHEAT—No. 1 Shipping, per ctl., $1.36¼; choice, $1.38¾; White Milling, good to choice, $1.40@@1.51¼.

BARLEY—Choice, oN. 1 Feed, $1.08¾@1.11¼; off grades, $1.05@1.07½; Brewing, No. 1, $1.12½@$1.20; Chevalier, $1.25@1.50.

BEANS—Prices per ctl.: Large Whites, $2.60@2.85; small do, $3.15@3.35; Pea, $3.25@3.50; Lima, $3.35@3.50; Red, $2.90@3; Pink, $2.50@2.85; Bayo, $2.60@2.85; Blackeyes, $2.65@$2.85; Red Kidneys, $4.25.

Hops.

The price for new crop is 22½@25c per lb, according to quality.

Wool.

WOOL—Spring clip, per lb.: California, Humboldt and Mendocino, 18@20c; Northern, 15@17½c; Nevada, 12@15c; Valley, Oregon, 15@18c.

Fall Clip—California, Plains, 8@10c; Foothills, 10@12c; Middle Country, 11@13c.

Eastern Markets.

Grain and Produce.

CHICAGO, Oct. 7.—Everything considered wheat prices were strong, due largely to the unfavorable weather throughout the entire wheat belt, although smaller receipts added to the general apprehension among shorts. Openingprices were firm, with December a shade to ⅛ to ¼ higher, at 77¼@77⅝, notwithstanding the rather indifferent tone of cables. With some improvement in the cash demand and on covering by shorts, the prices advanced early to 77⅝@77¾, but later sold off again on prospects of more favorable conditions. Selling pressure was augmented by a private crop estimate of over seventy million bushels for the crop year.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	34,300	15,000
Wheat, bushels	145,900	27,200
Corn, "	487,100	893,900
Oats, "	432,000	183,700
Rye "	5,100	3,000
Barley, "	289,000	4,400

Chicago Live Stock.

CHICAGO, Oct. 7.—Cattle—Receipts, 27,000; slow and lower; good to prime steers, 5.20@5.90; poor to medium, 3.65@4.90; stockers and feeders, 2.25@4.15; cows, 1.40@2.50; bulls, 2.00@4.30; calves, 3.50@4.70; Texas fed steers, 2.75@3.50; western steers, 3.00@4.75. Hogs—Receipts, to day, 18,000; tomorrow, 20,000; 10@15c lower; mixed and butchers,' 5.40@6.10; good to choice heavy, 5.50@5.90; rough heavy, 5.00@5.45; light, 5.60@6.10; bulk of sales, 5.45@5.85. Sheep—Receipts, 32,000; sheep and lambs steady to 15c lower; good to choice wethers, 3.35@3.80; fair to choice mixed, 2.25@3.25; western sheep, 2.25@4.00; native lambs, 3.50@5.65; western lambs, 4.40@5.40.

California Dried Fruits.

NEW YORK, Oct. 7.—The market for evaporated apples is qu et, small jobbing sales of old apples shows unattractive quality and rules neglected. Common are quoted at 4@5; prime at 5¼@5¾; choice at 6@6½, and fancy at 6¾@7½. Spot prunes are firm, with Coast advices 7½. Spot prunes are firm¼¼¼⅜ advices indicating bullish views among holders. Quotations range from 3¼ to 7 for all grades. Apricots also are firm, with choice quoted at 9¼@9½; extra choice are 9¾@10¼, and fancy at 10½@12. Peaches are quiet, at 7¼@7¾ for choice; 7¾@8¼ for extra choice, and 9¼@10½ for fancy.

CITRUS MARKETS

ORANGE AND LEMON MARKET.

The orange market during the past few days has not developed into anything like a strong demand. At the principal Eastern points where the market is usually active, no special call has come for orange shipments. A limited sale at auction points has been made, but nothing to command special notice in the way of prices has come up.

The Citrus Fruit shipments from Southern California to Tuesday last, were 22,163 carloads, of which 2673 were lemons.

AUCTIONS.

PITTSBURG, October 5.

Covina Fr. Ex., Butterfly Val., $3.35; Holly, $2.70.

BOSTON, October 7.

Covina Fr. Ex., Red C. Val., $3.80; White C., $2.85.

PITTSBURG, October 7.

C. C. U., National City, Sunset Lemons, $2.00.

A New York journal, in commenting upon the closing of the deciduous fruit season in California, says: "About six thousand cars have come East, including all varieties, and only 700 to 800 cars, consisting principally of grapes, remain to come forward. It is probable that when the reports are all in it will be found that shipments from the state will be about the same as last year. This will be a disappointment for growers and shippers expected a material increase."

As to raisins, prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b., at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb. box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.55; Two-crown London Layers, $1.45; Four-Crown Standard, loose, Muscatels, 7c per lb; do, Three-Crown, 6½c; do, Two-Crown, 6¼c; Seedless Muscatels, 5c; do, Seedless Muscatels, floated, 5¼c; Seedless Standard Sultanas, 5c; Thompson Seedless, standard, 6c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz. per lb., 7¾c; choice, 7½c; fancy, 12 oz., per pkg., 6⅜c; choice, 6¼c; bulk, per lb., fancy, 7½c; choice, 7¼c.

ALFALFA FARM FOR SALE—

40 acres, (18 in alfalfa) well improved, three flowing wells with good pumping plant, almost new, with 500 feet of 6-inch irrigating pipe. Windmill with 2,500 gal. tank. Large barn, four-room house, all fenced and cross-fenced. Located one mile west of Hynes, 12 miles from Los Angeles. Price, $5,000.

J. W. GAINES, Hynes, Cal.

SUMMONS.

No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 14 day of Sept., A. D. 1903.

C. G. KEYES, Clerk.

(Seal) By C. O. Winters, Deputy Clerk.

We have the best thing yet for preserving fence posts and all timbers under water or under ground, also for all iron roofing and pipe. If you will take sound, dry posts and properly coat with our preparation the part that is to be in the ground, the fence will stand up long after you are laid out. We manufacture the preparation (protected by patent) and ship in amounts required. One hundred pounds is enough for fifty posts. Any man can do the work. You melt up the mixture in a kettle, heat it to boiling point, keep it stirred and apply with a brush, if your kettle is not deep enough for dipping. Full directions sent with every shipment. The posts are ready for use as soon as the coating cools. The process is cheap and absolutely effective. Write for prices and particulars. We want an agent in every county.

HOEGEE'S LEMON CURING TENTS

Are now in use by nearly all leading fruit growers and packers. It has been proved that the plan upon which these tents are made is the only feasible and correct way for curing lemons. The loss from decay is less by many per cent, besides they properly cure and preserve the fruit for late market, which adds greatly to its valuation.

Send for further information regarding our lemon curing tents, fumigating tents, special spray hose and fruit picking bags, and if you are interested we shall be pleased to send our Hunting, Camping, Marine, Garden Hose, Flag, Athletic or Sporting Goods Catalogs.

GRAPE GROWING IN CALIFORNIA

By John Isaac, Sacramento

No class of fruit has paid better in the past few years than table grapes. These always are in good demand in the eastern market and when attractively packed, and properly selected, are pretty certain to bring good returns to the grower. The principal section producing table grapes is Sacramento county and the counties immediately surrounding it, San Joaquin, Yolo, Sutter and Yuba. In these counties there has been a very largely increased acreage of this class of grapes planted during the past two years, very much of it by those already engaged in the business, so it is evident that those who know best still have faith in the profitableness of growing grapes for shipment.

Conditions suitable for growing grapes in general, are also suitable for those grown especially for table use. They are not particular as to soil and will do well on a wide range from light sandy to a heavy loam. They delight in a warm soil however and do not do so well on adobe. In Fresno county, which is the home of the grape, the favorite soil is the white ash or a red sandy loam. These are the two extremes of grape land, and both have their advocates, depending largely upon ownership, for those who have red lands, think their peculiar kind of soil best for grapes, while the owners of white ash soil declare that there is no soil equal to it for grapes. The white ash is a very light soil, carrying a varying amount of sand from 30 to 60 per cent, while the red soil closely approaches a clay. The vine has little regard for the lay of the land but seems to do well on either level or hilly land, with perhaps a preference for hilly, well drained locations. Some of the best of the wine vineyards are found on very steep hillsides and good results are obtained from this character of land. In summing up, however, it may be asserted that the grape finds its ideal location in warm, sandy, or even gravelly loam, deep and well drained and with a warm exposure, preferably to the south.

In matter of climate it is almost needless to say that the grape delights in warmth and that the best results with table grapes are obtained in the interior valleys, away from the cooler districts of the coast. The grape, to do its best, should have a long season, say from June to October, without rainfall and with a temeprature ranging from 60 to 100. This high temperature is especially desirable during August and September, the period of ripening, and during which time the fruit is filling out and acquring size, flavor and color. Cloudy or cool weather during this time is very detrimental to the fruit, and a climate that is too moist is very liable to cause mildew and other fungus diseases of the vine and fruit. In the matter of climate, therefore, the requirements are plenty of clear, warm weather, and we may add even hot weather, if not too excessive or long continued, in fact just such as the San Joaquin and Sacramento valleys can supply.

In setting out a vineyard, the soil should be thoroughly prepared beforehand, remembering that the work is to be done once for all time, so far the the new vineyard is concerned, and that it will show all neglect and bad treatment in the future, while proper preparation and careful planting will pay handsome dividends year after year. It is better, if possible, to commence the work of preparation the year before the vines are to be set out, by thoroughly and deeply plowing the land. A cultivated crop may be grown, and the soil kept thoroughly pulverized. In the winter season it should again be plowed and cross plowed, putting the plow in to the beam, then it should be leveled and staked off. The distance at which the vines are planted varies, according to the ideas of the individual planter. The stakes are to be set out eight by eight feet, eight by ten, ten by ten, or sometimes six by twelve feet, leaving an avenue about every tenth or twelfth row sufficiently wide to accommodate a team in packing season. The method of setting out a vineyard is very much the same as in setting out an orchard. The first row is carefully spaced off and should be perfectly true. A very light framework, triangular in shape, one side equaling the distance between the rows and the other the distance of the vines in the rows, the two sides forming an accurate right angle with each other is used. If the base of this triangle is placed on two of the pins already set the apex will mark the spot where the peg is to be set in the next row, and by moving the guide along the row one peg at a time, the next row can be staked out, and the operation repeated until the whole vineyard has been staked. This is the quickest method, and if care is exercised, is very accurate. Some, however, use a line upon which short pieces of different colored cords are tied at the desired distances, and when the line has been stretched the pegs are set against the marks, others use a wire with small lumps of solder attached. Any of these methods answer the purpose which is, of course, to lay out the vineyard in straight rows of equal distances apart, so that subsequent care and cultivation may be easily accomplished. The pins are usually dipped into whitewash and so are conspicuous when they are standing in the field; they are left after the vines have been set out to mark the location of each vine, for the first season, as otherwise there would be danger of interfering with the young vines while cultivating or working the vineyard.

In setting out the young plants, where rooted vines are used, and they are the best, ample root room should be given in digging the holes. It is a mistake to crowd the roots into a hole too small to accommodate them, and, like all slouchy work in the orchard or vineyard, will bring its punishment in decreased growth and diminished crops. A little extra time and more careful work at the commencement will always pay. As the young vines are set out each one should be cut back to two buds and left for its summer's growth. In sections where irrigation is necessary, the vines should be watered after they are set out, and the land then leveled off with the cultivator. During the first season the vineyard should be cultivated at least once a month, and in irrigated sections it should be cultivated after each application of water, which is usually once in two weeks or less.

In good soil and with proper care the young vines will make about two or three feet of growth during the first summer. This should be pruned back during the pruning season, in

It may be a little early to say, but not much either, that as we are approaching the tourist season an effort should be made to clean up, dust up and otherwise improve the appearance of our California towns. Los Angeles, San Francisco and San Diego especially need thorough cleaning. We may avert small pox, typhoid fever, diphtheria and other malignant diseases by a systematic overhauling of our streets and alleys. Now is the time to begin this work; then when the rains come we shall derive the benefits which cleanliness brings.

From statistics recently compiled it appears that the American electric street lines carried a number of passengers, during the last fiscal year, equal to more than four times the population of the earth. The number of paid fares reached nearly 6,000,000,000. The total distance traveled by the lines was 1,099,256,744 miles. This says an authority is equal to 2080 round trip excursions from the earth to the moon.

A wise weather prognosticator in the Los Angeles Herald, discussing the probability of a wet winter, says, "If we have enough rain we will have a wet winter, whether the moisture comes early of late; otherwise a dry rainy season will be our fate." How wise!

Leonard Coats in the Fresno Republican has been doing some good work to secure the Fruit Growers' Convention for that city in December. We understand the matter is about determined in favor of that city.

FOREST RESERVES PROTECTION.

The subject of forest reserves is rightly beginning to occupy much attention by the commissioner of the general land office. That official has, within the past year withdrawn from entry nearly 12,000,000 acres of land in Northern California with a view of selecting and setting apart at least three forest reserves.

The necessity for this action has been apparent for some time. The northern watershed of the state stands much in need of some protection in the way of conservators for the water and snow which fall in that section and find their way to the Sacramento river, which at certain seasons of the year overflows and submerges the lowlands, destroying crops and laying waste valuable property. The forest cover has long been admitted to be the best conservator for rain and snow as it holds in reserve a large percentage of the moisture which falls on the earth.

Marsden Mason has shown that the forests are far better conservers of water than the most extensive system of reservoirs that the wealth and industry of man could furnish. The total estimated artificial storage capacity of the drainage basin of the Yuba river, for instance, is only 3.3% of the precipitation. If the forests were removed it wold be impossible at any expenditure to supply their place in water conservation.

Two subjects ought to take precedence in the public mind in this state. One is irrigation, the other tree planting and forest reservation. It has been proven beyond dispute that we can have no successful irrigation without trees or forests, for we can not well preserve the water without the forests are maintained.

This thought was tersely expressed by the President in his speech at Sacramento in May of this year. In that address he said:

"I have just come from a four days' rest in the Yosemite; and I wish to say one word to you here in the capital city of California about certain of your great natural resources—your forests and the water supply coming from the streams that find their sources among the forests of the mountains. California possesses a wonderful climate, a wonderful soil, and throughout the portions that I have visited it is literally astounding to see how the land yields a hundred and a thousand fold when water is put upon it. Where it is possible to irrigate the land, the result is, of course, far better than having to depend upon rainfall anywhere, but no small part of the prosperity of California in the hotter and dryer agricultural regions depends upon the preservation of her water supply, and the water supply cannot be preserved unless the forests are preserved. As regards some of the trees, I want them preserved because they are the only things of their kind in the world."

It is well that the government is turning its attention to this important branch of public improvement, and it is to be hoped its efforts along this line may be seconded by association and individuals, intrusted in the great work of preserving the forests, to the end that the water sheds of the state may be protected and irrigation made more general.

The illustration on the cover of the Cultivator fairly represents the glory of the Sequoia forest before the introduction of the woodman's ax. Today unfortunately, the scene is changed and where once stood the splendid pines and oaks nothing but scrubs and brush are now in evidence.

CAN NOT RIVAL CALIFORNIA.

Some heavy shipments of oranges are reported as having arrived in the eastern markets from Mexico, and it is claimed that these shipments will increase each year, and that there is danger of Mexico becoming a dangerous rival with California in the citrus fruit industry. There is little danger to be apprehended from this latter cause, but in these heavy shipments of citrus fruits from our sister republic there is more real and threatening danger, which it will be well for us to guard against. The Morellos orange maggot, starting in the state from which it derives its name, has now spread over nearly the whole country, until there are few sections immune from its attacks. This is one of the most disgusting of the fruit pests, as it reduces the fruit to a mass of rotten pulp, crawling with maggots. The presence of the pest is not noticeable until the damage is done. The eggs are laid in masses as the fruit is ripening, they hatch out small maggots, which at once commence eating their way into the fruit. Their presence renders shipping uncertain, as the keeping quality of the fruit is impaired, but it may reach the table before the presence of the maggots is discovered. It may be readily seen that, when it is known that in purchasing oranges the buyer is likely to get a mass of crawling maggots with it, the market will soon be curtailed and prices drop. It is here that the serious danger from the importation of Mexican fruit is to be found, and not in any competition in our markets. When this class of fruit finds its way into the United States, it is very difficult to prevent its introduction into our orange sections. Eastern tourists may purchase the fruit en route and bring it with them, and finding maggots in it throw the infested specimens from the car windows, and then the damage would be done, or there are a thousand other ways in which it may obtain a foothold. While we have a strict state quarantine against the introduction of infested fruits and plants from foreign points, California has no jurisdiction over outside points and it is impossible to protect her whole border from the introduction of these or other pests in the manner set forth. There should be an international quarantine system. Fruits, trees, plants, etc., likely to introduce infection should be admitted only at certain ports, and here there should be stationed competent inspectors, and when there is a serious pest, as this orange maggot, the fruit that breeds it or the section in which it is found should be quarantined against. We have not got this pest, we do not want it, and every effort should be made to convince the government to that effect, for the citrus industry now is a most important one and the introduction of the Morellos fly may ruin it. Competition is not half as much to be dreaded. That may lessen our profits, the maggot will destroy them entirely.

THE BUSINESS PULSE.

Despite the uneasiness which has prevailed at times during the past week in the commercial world, there is reason to feel grateful that, on the whole, business has held its own, and that instead of discouraging signs there are encouraging features about the industrial and trade situation. The only uneasiness manifested has been in the stock market where, between the bulls and bears, an interesting condition has existed.

The critical situation of affairs in the Orient has had a tendency to unsettle financiers and cause them to take account of matters in order to be ready for any emergency that may present itself.

Building operations have been resumed in many of the larger cities and the prospect for great expansion along this line of industry is flattering in the extreme.

The movement of merchandise and manufacturies has quickened if anything, and the great continental transportation companies are increasing their facilities for the carrying of the vast crops which are being harvested East and West. The only matter of concern is whether the carrying ability of the railroads will be equal to the demand upon them. It is very doubtful if it shall be. In the staple products the tendency of prices has been downward, and this has benefited both domestic and foreign trade. The movement of wheat in the interior has grown larger and export figures show a good gain.

There are some irregularities in the manufacturing centers, but on the whole the situation is fairly good. Iron ore production is restricted and furnaces are feeling the effects of an over supply, but no uneasiness is reported in the metal industry as a whole. Cotton mills are still affected by the raw cotton market and are waiting for normal conditions. Wool mills and shoe shops are busily engaged and industry at large is keeping pace with the general progress of the country. There is apparently a disposition on the part of labor, in certain quarters, to accept more reasonable demands and to go to work on terms which contractors can build on. This is having a brightening effect on things all along the line of trade and industry.

WAR SEEMS IMMINENT.

The war clouds are gathering darker linings each day in the East. That the world is to witness a contest between Japan and Russia seems today almost an assured fact, because of Russia's ambition to possess the peninsula of Corea. Russia has all along professed not to be preparing for war, so has Japan, but nevertheless, preparations have been going forward by both governments which leave no doubt in the minds of the statesmen both in America and Europe, that war is expected and must come.

Of course it is generally believed that Russia will conquer Japan, and if so, the question arises, what will be the effect on American interests. It is further believed by our leading statesmen that there is more professions of "good intent" on the part of Russia toward this government than purpose and that she feels in case of immediate war with Japan she can practically ignore or defy us. She feels that such an excuse must be accepted as ample for abrogation of all her promises in regard to that region. In any event, she does not fear the possibility of armed intervention by the United States.

So far as other powers are concerned they will probably keep hands off, confining their interest to moral support which will be so weak as to avail nothing—as usual.

A correspondent writing from Manchuria, says, "the feeling in Japan is so intense that it will be impossible much longer to avert war unless Russia changes her attitude toward Japan very quickly."

So far as the United States is concerned it will hesitate to take any decided stand between the two contending governments unless our interests are threatened with irreparable loss. We can not afford to lose valuable rights in the territory in dispute and we shall feel keenly any break with Russia which at the time of our civil war was our steadfast friend. A war would benefit American trade and commerce, but it is to be deplored nevertheless.

From a Business Standpoint

By J. W. Jeffrey, Los Angeles

DELAYED INTELLIGENCE.

It is gradually sifting into the understanding of the ill-wishers of the East that there is to be no disruption of the California Fruit Exchange or the California Fruit Agency. This intelligence though somewhat tardy in finding lodgment where it will do good, seems at last to have taken hold of the citrus fruit trade. And now we read fulsome eulogies of the whole plan under which the Californians propose to manage their own business. The men who brought about the reconciliation of the San Bernardino Exchange are spoken of as masterful, adroit and up-to-date, and the forces which were erstwhile predicting a general abandonment of the co-operative plan are now swallowing their medicine.

The falling away of the co-operative method of marketing citrus fruits would be a calamity outside its effect upon the citrus fruit industry. For nearly ten years it has been an example and an inspiration to other lines of co-operative effort. The birth of the Exchange occurred when utter chaos reigned and ruin stared the growers in the face. Growing in the face of the most strenuous oposition ever encountered by a popular movement and gradually establishing the fact that it was based upon business-like principles it has finally been approved by practically all the growers and adopted by the former independent dealers. Those who had thought it the only example of the successful organization of the agriculturist in the land trembled at the effect that would follow the dissolution of the co-operators' organization. The Exchange had demonstrated its ability to keep abreast of all difficulties by adopting new lines of policy as the necessities of the situation developed. But this season, in the face of the biggest and poorest crop of citrus fruits ever produced, competition of Florida, high freight rates and heavy refrigeration charges, the Exchange met propositions too stupendous to be handled with only one-half of the crop under its control. Internal competition within its business, the holding back of inordinate qquantities of fruit and the consequent over-loading of the markets caused the same great forces that had held the growers in line so long call for a readjustment that should bring under one management at least 90 per cent of the fruit. That an entirely new plan be adopted was patent to all, for it had been found impossible to gather more than one-half of the growers into the co-operative organization. The fruit dealing firms with 50 per cent of the growers backing them could not be ignored, and should not be as long as they had such a hold upon the trade, and the result was the formation of an agency that must work to the betterment of the entire industry.

The extent of the calamity threatened by the withdrawal of a considerable number of associations cannot be contemplated without fear. Had the old-independence of action resulted, all the work of the decade would have been set at naught and old-time chaos invited. Never in the history of citrus fruit growing has united action been so essential as at the present time. One cannot contemplate the array of excommunicated commission men and other irresponsible dealers without seeing the strength of the enemies of awaiting with glee the first evidence of disintegration among the growers. Disaster would be a mild term to apply to the results that would inevitably have followed the dissolution of the mutual marketing plan and it is pleasant information we are receiving that the growers are standing fast all along the line. Outside the lines of practical experience gathered in the last decade in this business, the brightest commercial minds of the age have long since demonstrated that unity of interest is essential. There is need of it in no line more than in that of the citrus fruit industry of California.

The pulp of the sugar beet is growin in popularity as a feed for the dairy cow.

..General Agriculture..

Six months without any rain in this valley and one of the best fruit and grain crops known for years!—Sutter County Farmer.

The record for the season was made at the sugar factory on Monday, when 935 tons of beets were sliced in 24 hours. Saturday and Sunday there were worked, respectively, 890 and 888 tons, showing good steady progress in reducing the crop. There have been sliced to date 45,000 tons.—Chino Champion.

The San Diego Silk Company, organized about a year ago, has made good progress and the prospects for the coming year are very flattering. Considerable silk was produced by the company this season; quite a grove of Mulberry trees has been set out at South San Diego, and several acres more will be planted this winter.—Riverside Press.

At a recent meeting of the directors of the California Grain Growers' Association, the statement was made that the farmers pay each year about $1,500,000 for grain sacks. This, it was claimed, might be saved to them if they would ship their grain in bulk. It was urged that the growers should provide proper storage facilities.—Santa Paula Chronicle.

The Southern California grape growers intend to follow the plan of the citrus fruit growers and will organize an association to protect themselves. The company will organize with a capital of $100,000 to $200,000, build a large winery and make and handle wine for themselves. This will have sufficient capacity to crush all the grapes the local growers can produce.—Citrograph.

The Santa Fe Railway Company has broken the record this season on transportation of California fruits. It is stated that this season the company will haul about 1800 cars of fruit, an increase of 3500 cars over last year. An order for 500 new refrigerator cars has been given and when received the Santa Fe will have over four thousand refrigerator cars, and will be independent of the Armour car line and other companies operating private cars.

"It doesn't make so much difference now whether we have good crops of apples, apricots, plums, etc., in Europe or not, says Consul General Mason in Rural Press. The American dried fruits fix the standard, both as to the quality and price and they will sell here to the extent that the American consumers can spare for export, no matter how great or small may be the home supply of native fruits. Your people have the sunshine, the soil and the improved varieties, with which our growers are unable to compete."

On the farm of B. Distel, near Mountain View, in Santa Clara county, a government experimental station is about to be established. Ten acres of land will be converted into an experimental vineyard for the purpose of testing all kinds of resistant stock and all varieties of wine grapes with a view of ascertaining what particular resistant is specially adapted to the soil and climate of Santa Clara valley. About sixty-four varieties of resistants will be experimented with and thousands of seedlings will be grown.

MOJAVE FOR GRAPE GROWING.

Local grape growers will watch with interest the experiment to be made by George Hussman for the United States department of agriculture, who will demonstrate the feasibility of converting part of the Mojave desert into a vineyard.

Already experiment stations are established for grape growing in various parts of the state, but the one at Mojave will claim all the local interest It already has been demonstrated in the Colorado desert that table grapes are most successfully produced in such regions and the same result is looked for at Mojave.

EXTRACTING OLIVE OIL

A representative of the "Cultivator" recently visited the Sonoma county Pioneer Olive Mill, owned by Dr. J Prosek, of Guerville near the Russian river. The doctor has 100 acres in olive trees and between the rows of the trees there is a vineyard of wine grapes Dr. Prosek's method of extracting olive oil is quite unlike the ordinary procedure. The olives are first run through a small mill which crushes the flesh only. The crushed substance is next put into a jute cloth. This cloth containing pulp is next placed in a square frame, made of inch boards, 24 by 30 inches, four inches deep. When the frame is full the ends of the cloth are folded secured over the top and the board frame or band removed. After several packages are thus made and piled up one on top of the other, the column is put under pressure, the oil crushed out, the pulp is taken from the cloths and run through the arasta crushing both the pits and flesh thoroughly. The difference of operation in extracting the oil under this method from the old one, is that the pits are only run through the arrasta once, while under the common method the olives are run through the arrasta and hydraulic press three times. Another difference is in the methods of extracting the water before running the olive through the arrasta.

The oil is taken from the press and put in large tanks for settling or ripening. After the settling the oil is then racked the same as wine, and run in a large tank having several faucets, one above the other, where by means of these faucets the oil is drained off from the top faucet and the water from the lower. The oil is taken from this tank and bottled ready for sale. Instead of the different system of filtering the doctor claims that the racking process is better, and holds that filtering changes the taste of the soil.

SAN DIMAS HORTICULTURAL CLUB.

San Diman Heights Horticultural club held its monthly meeting at the home of J. W. Walker on Tuesday evening of last week. One hundred and sixty guests were seated in the dining room, while over fifty were seated in the hall, in all 210 members and visitors.

The programme consisted of papers and addresses by Bryce M. Given, of Charter Oak, James A. Johnstone, E. W. Hart, Frank J. Johnston, W. D. Ellis, Prof. C. F. Baker, who was to have read a paper on "Humbugs," was unable to be present. But will doubtless read his paper at the next meeting of the Club, Nov. 3rd. Frank Wheeler, the President of the Club called attention to the attacks on Prof. Cook by a paper in Los Angeles, and James A. Johnstone presented a very strong resolution endorsing Prof. Cook and his work at the Institutes in this part of the state.

PAYS A DIVIDEND.

The Hollister Irrigation Company paid this week a dividend of $1 per share to the stockholders of the concern. This is the first dividend that has been distributed by the corporation, although it has had an earning capacity for some years past, the surplus being utilized for extensions and substantial improvements. These have been completed in a highly satisfactory manner, which will prove a material benefit to the company in the future. Since its organization the irrigation company has proved itself of inestimable value to the people of this section, converting as it did, the lands along its ditches into profitable orchards and large producing alfafa fields. While the company at times has been handicapped for an extensive water supply the directors were equal to the occasion and to whom a great deal of credit is due for their satisfactory distribution of the water for irrigation purposes. They deserve further praise for their economical management of the company. The Hollister Irrigation Company is an improvement of incalculable value to this valley.—Hollister Free Lance.

Citrus Fruits

Azusa oranges took the gold medal at the Irrigation Congress, and the Pomotropic rises up to congratulate its county and its orange growers on the "glorious fact."

It is announced that the foreign lemon crop will be delayed at least a month, owing to bad weather conditions. This will put the California crop on the market in just about the right time.

Florida is going to have an abundant crop of oranges this season and the fruit is of the best quality. A commission merchant who has been through the state writes that the state has the best prospects in years. The grape crop, however, will be short.

The commissioners for California have been notified by the World's Fair management that the space heretofore allotted this state has been reduced. It was desired to get some additional room for our exhibits, but it now appears that this can not be secured.

Speaking of the coming orange crop in Tulare county, the Lindsay Gazette says: The crop to be handled is reported to be first class in quality and as we have heard no complaints of shortage of yield it is safe to estimate our season's output as at least 400 cars.

The Redlands Board of Trade is arranging to send five carloads of oranges to the World's Fair at St. Louis for free distribution and exhibition. The committee chosen to take charge of the forwarding is composed of C. M. Brown, H. L. Graham, H. P. D. Kingsbury, J. R. Spencer and C. J. Curtis.

Southern California awards at the recent National Irrigation congress at Ogden are these: Oranges, Azusa Foothill Citrus Association, Azusa, gold medal; lemons, C. W. Leffingwell, Whittier, gold medal; pickled olives, James Hill & Sons, Los Angeles, gold medal; oranges, C. C. Chapman, Placentia, second prize; lemons, Lemon Growers' Association, North Ontario, second prize; olives, James Hill & Sons, Los Angeles, second prize.

Another large tract of land is to be planted out to navel oranges this coming season. The land is situated south of Plano, formerly known as the Mitchell place, but now owned by J. Sullivan of Emerson, Manitoba. Mr. Sullivan writes that he will be here the latter part of November, when he expects to put down two wells to irrigate eighty acres of his land, which he will plant to oranges, and that he has already placed his order for 5000 trees with George McCalister.—Riverside Enterprise.

SAN BERNARDINO COUNTY FRUIT EXCHANGE.

The ninth annual meeting of the San Bernardino County Fruit Exchange was held at Colton on Thursday. October 8th.

The following officers and directors were elected for the ensuing year: James Barnhill, president; J. S. Edwards, vice-president; Earl F. Van Luven, secretary and manager; S. H. Barrett, E. J. Yokam, A. L. Drew, L. H. Winston and G. N. Turner. The managers annual report showed that the total shipments for the season amounted to 238,954 boxes, equal to 660 car loads, an increase of 47% over last season, the fruit being sold for $576,612.11, or net f. o. b. $343,016.21. The average price per box f. o. b. for everything shipped, including oranges, lemons and grapefruit, was $1.44. The average price per box f. o. b. for everything shipped of the different varieties, including all sizes, was: Navels, $1.43; Valencias, $2.15; Seedlings, $1.09; Med. Sweets, $1.40; St. Michaels, $1.74; Bloods, $1.44; Lemons, $1.25. The fruit under the control of this Exchange for the coming season is estimated at from 1300 to 1400 cars.

California Horticulturally

JOHN ISAAC, SACRAMENTO

THE NEXT FRUIT GROWERS' CONVENTION.

It has been decided to hold the next Fruit Growers' Convention at Fresno, commencing on the morning of December 8th and continuing until the following Friday, the 11th. The chief subjects which will come before the convention on this occasion will be in relation to the raisin industry, wine grapes, citrus fruits, transportation and marketing, and co-operation. Arrangements have been made with both railroads to secure to members of the convention reduced rates of transportation, and the people of Fresno will see to it that ample entertainment is provided for their guests outside of the convention. The holding of this convention in Fresno is in accordance with the express wish of the last convention, at which time it was decided by vote to hold it there. The location is convenient and within reach of all parts of the state, both north and south, and as the topics to be considered are of the greatest immediate importance, and will be discussed by the best and most practical men in the state there will be without question an unusually large attendance.

* * *

GRAPE MEN ARE STILL SORE.

There is no abatement in the disappointment felt by the wine grape men over the extraordinary and sudden depression in the price of their product this year. With good crops and every prospect for good prices, the sudden slump came like a bolt from a clear sky. There is a world of growling, but it does the grower no good, except so far as it enables him to let off some of his surplus indignation, for he is in the door, and he can either take what is offered him by the wine combine or let his grapes rot on the vine. It may be that out of this some relief may be had another year by the growers themselves combining and manufacturing their own wines. One thing is made very clear by the action of the wine association, and that is that the unorganized are wholly at the mercy of the organized, and that in organization is the only hope for the producer.

* * *

SQUIRRELS AND JAYS DISAPPEARING.

Does life on this earth move in cycles, and when it has reached a certain stage either get a set-back or disappear entirely? Geology, and even modern history, furnishes examples of the disappearance of species that were probably up to a certain period, existed for practically all time on the earth, only to disappear when their time limit had arrived. In other cases sweeping epidemics have reduced the species to the lowest limits leaving only enough to give them a fresh start. Word comes from San Mateo county that for miles out at sea on the coast side of that county the ocean is covered with dead fish, while the shores are lined with perfect windrows of them that has been washed ashore, and no cause can yet be assigned for this remarkable mortality. In parts of the state where the blue jay has been one of the greatest of pests for years, where it had driven out all of the other birds by robbing their nests, and where it was a race between the farmer's wife and the bird for the egg when the hen cackled, with the chances in favor of the jay, not a bird of this species has been seen this season. The ground squirrel, too, that abomination of the farmer all over the state, has almost entirely disappeared over large areas in the northern counties and the cause so far is a mystery, although it is supposed that some contagious disease has been sweeping them off the face of the earth by millions. It is a fact that over large areas where you could in former years see these pests by the score, and count them by hundreds, they are now rarely to be seen. very much to the satisfaction of the farmers who have heretofore suffered severely from their depredations. The Secretary of the State Board of Health has been investigating the cause of this disappearance, and says that it is his impression that it is some special disease which the squirrels have acquired that is killing them. If it is found that the disease is of a special nature and not detrimental to human kind an effort will be made to obtain the virus for distribution in other sections where the disease has not yet appeared.

* * *

SUFFICIENT FARM HELP THIS SEASON

While it would have been possible to have used many more people in the orchards and packing houses than have been employed this season, the shortage that was feared at its opening has not occurred. There has been sufficient help in most parts of the state, especially in the deciduous fruit sections, to care for the crop without serious losses such as occurred last year. It is true that in very many cases long hours have prevailed and the people employed have been worked overtime, but now the season has come to an end and there is no complaint of any serious shortage. This is unquestionably due to several causes. First to the fact that the growers and packers expected a repetition of the experience last year, and had trimmed their sails to the breeze and were prepared to do the greatest amount of work, with the smallest available help; secondly, all available help was pressed into service and many women and children, students and others, who had not before taken part in orchard work gave their time to help over the rush period, but still another and perhaps the most important factor was the work done by the Promotion Committee aided by the committee of Fifteen on Labor appointed at the Fruit Growers' Convention in San Francisco last year, and of which Hary P. Stabler is chairman. In this work, too, material assistance has been received from the railroad companies in this state in the way of reduced rates for immigrants and facilities extended for advertising our needs and advantages in the east. It is not now probable that we shall again, or for a long time at least, be called upon to face as serious a shortage in the farm labor market as we were last year.

* * *

CALIFORNIA CAN GROW APPLES.

We remember in early days that there was a sort of a tradition that apples could not be grown in California, and so deeply grounded was this tradition that no one tried, and if any one planted an apple tree he was looked upon as an heretic to the true faith. Some enterprising men however started in to raise apples and soon proved that the old time dogma was a mere superstition, that apples could be grown in many parts of California and the best apples in the world at that. All along the coast section of the state there are vast extents of splendid apple land, while in the mountains there are thousands of acres upon which fruit, unequalled in quality, can be grown. It seems strange that a state where a few years ago its own people believed apples could not be grown and had settled down to that belief, is now shipping this fruit to Europe, to markets heretofore exclusively filled by the eastern and Canadian apple sections, and even shipping this fruit of the northern states into those states themselves. Watsonville, the center of the Pajaro Valley apple district, is now shipping several carloads every day, and before the season is over will have sent out over 1000 cars, to European and eastern points. This is good for a state that a few years ago declared she could not grow apples. The fact is, Californians never know what they can do until they try.

PRESERVING SWEET POTATOES

Bulletin No. 71 of the South Carolina agricultural experiment station, on "New Method of Preserving Sweet Potatoes," contains a discussion of a new method of evaporating sweet potatoes. The problem which the station undertook to solve, was to reduce the bulk and weight of sweet potatoes by drying off surplus moisture and so sterilize the product as to exempt it from fungus diseases to which the green product is subject, and at the same time without impairing the edible qualities of the desiccated product.

In 1889 the roots were peeled, sliced and dried in a movable evaporator. This rendered the product non-perishable, but destroyed the flavor. The surplus moisture was removed, but the absorption of the moisture was not satisfactory. In 1900 a satisfactory article was produced by boiling the potatoes before evaporating them. This process was irregularly done and was not demonstrated to be a complete success until in the fall of 1901. At this time a room was equipped for steam heating in connection with a cannery of the experiment station. By means of a derrick used in the cannery several bushels of the green potatoes were lowered in an iron basket into a large boiler, in which the water was heated by steam. Those weighing from one to two pounds required one hour for thorough cooking and six to eight hours were required for evaporating them at a temperature of 150 degrees F. An ordinary laborer peeled and sliced one bushel per hour.

A large number of varieties of sweet potatoes were evaporated in this way and it was proved that the evaporated product was not only not perishable, but contained only 3.42 per cent of moisture and will keep for an indefinite time and bear transportation to any part of the world at any season.

To prevent hardening the product it should be packed in close boxes as soon as possible after removal from the hot room. In preparing the potatoes for cooking the slices should be soaked in warm water for an hour and prepared the same as dressed or candied potatoes. The desiccated potatoes may also be used as are the fresh roots for puddings or custards.

Olive oil is fast becoming one of the staple products of the valley, says the Oroville Register, especially of the foothills regions, and the success attained in the growing of this fruit is scarcely second to that which has attended orange culture.

The Hoyt Tree Support

"The Propless Tree Prop."

TWIGS BENT OUT OF SHAPE BY HEAVY CROPS SOON SPOIL THE TREE

They won't be bent if you use the

HOYT SUPPORT

the Best of All Props.

Its great point is in the ECONOMY. ECONOMY as to price when purchased and ECONOMY in the time required to apply it. No stakes are necessary. ECONOMY in this, that the props may remain in the tree from year to year.

GRUBS IN STRAWBERRY LAND.

Editor Cultivator:—Please inform me through your paper how to prevent grubs from getting a start in land which is to be heavily manured for strawberries and what to do with a bed that is already infested with grubs.—F. H. H., Escondido.

The grubs that you refer to are undoubtedly the larva of the "June bug" that doubles itself up when disturbed. If that is the pest you have in your strawberry bed and it is numerous enough to injure the plants, the only thing you can do is to plow the ground up and let it lay fallow or else grow a couple of crops of hay on it and allow the land to become dry and hard for two seasons. This grub requires three years to mature and the only way to run it out is to treat the land so that it is distasteful to the insect. The mature bug that lays the egg from which the grub is hatched, flies at night and burrows in the ground before day light. It will burrow in the ground beneath any tree or plant on which it happens to be feeding, provided the soil is not too hard. When the egg laying season comes, it selects soft moist earth in which plants are growing, or else a manure pile. The latter is a favorite place for them and the small worms may be seen by the hundreds in well rotted manure. Manure which contains the small grubs should spread out and made absolutely dry before placing on a strawberry bed or ground to be used for strawberries. The adult insect, or the grub, cannot stand sunlight and the grub will soon perish if the manure is allowed to dry in the sun. Plow up your grubby patch and sow it to grain and do not plow the land until you sow it again. The object is to get it as dry and as hard as possible, with no edible roots for the worms to feed on. If the land were allowed to lie idle for two years with no weeds growing on it, you would be sure to make a clean sweep of them, but a hay crop will give them a hard tussle, and give you some returns.

* * *

HOPS IN SAN DIEGO COUNTY.

Editor Cultivator:—Will you please inform me through the columns of the Cultivator or otherwise, whether hops can be successfully grown in this locality with irrigation, and can you refer me to some good publication on hop culture.—J. H., Pacific Beach.

Unless you have a deep, rich and naturally moist bottom land, we should discourage any idea of growing hops for profit. They are only profitable where the soil is a deep river bottom loam and irrigation is unnecessary. Even in such localities the crop is often a money loser. Hops do not take kindly to irrigation. They will not stand having the soil packed near to them and the soil cannot be disturbed around them after they begin to grow. The cost of equipment is very great, the kiln alone for curing hops from a 20-acre tract will cost $2,000. The other items of expense are very heavy, but vary in different localities. The price of hops varies from 5 cents to $1.10 per pound for the growers, so it is a very uncertain crop as far as profit is concerned. The expense of irrigation would make the chances of profit much more variable. The best publication we know of on the subject is Farmers' Bulletin No. 115, entitled Hop Culture in California. Address the Secretary of Agriculture, U. S. Department of Agruculture, Washington, D. C.

* * *

PEARS AND SICK ORANGE TREES.

Editor Cultivator:—I have four Winter Nelis pear trees and only one of them bears any fruit and that is very unsatisfactory both in quantity and quality. What fertilizer can I give them to make them bear fruit? The mottled leaves I enclose are scattered nearly all over my orchard. I used last fall, stable manure and in the spring nitrate of soda, also during the summer my largest trees (19 years old) had a small additional amount of the latter. Is it possible that all of the trees have had too much nitrogen? I shall be very greatly obliged if you can tell me what to do in either case.—M. T. A., Pomona.

Your experience with Winter Nelis pears coincides with our own. The usual difficulty in such cases is that failure to fruit is due to lack of proper pollination, but in our case we were sure that we could not improve that condition, for we had over sixty varieties of pears blooming in close proximity to our Winter Nelis trees, yet there may be some variety that would do the work. Our advice is, to graft the trees to some other variety. We prefer for a selection of four trees, Lawson, Bartlett, Seckel and St. Andre. These trees will furnish you with good pears from the first week in July till the 15th of October. St. Andre ripened its first fruit this year on August 10th and we have eaten fresh and baked pears from it ever since, and they will last until the 15th of this month.

We cannot give you any satisfactory solution to the mottled leaf that is affecting your orange trees. That is caused by so many different disorders of the tree and soil that we should have to know all the details to even give a reasonable guess. We are quite certain, however, that you applied the stable manure at the wrong time of the year. Stable manure will stimulate growth very soon after applying it, and a fall application will bring out growth that cannot harden up before freezing weather sets in. All nitrogenous fertilizers that are so immediately available as stable manure and nitrate of soda should be applied in the spring, say after the middle of March. Too much nitrogen might cause mottled leaf. But it is not likely that it causes it on your 19-year old trees, unless you have been dosing them with it pretty heavy for some time. It is our opinion that if you make your irrigation furrows at least a foot deep and run the water in them for not less than 24 hours, and beter still, 48 hours, there will be a change in your trees. We take it for granted you have not done this, for it is an expensive way to irrigate and the furrows have to be made by running a plow twice in the same place. If you dig down three or four feet, you can determine whether the lower roots are in soil too dry to give much support to them, and if such is the case, deep furrows and a long run of water will undoubtedly help your trees. The length of time that you should run the water without loss, can be determined by boring down by the side of the furrow with a post-hole auger. Ordinarily, the water should be turned off when it has penetrated to a depth of about seven feet. That sort of irrigation will last your trees much longer than two or more irrigations given in furrows made with a "bull-tongue" furrowing-out machine. On very thin gravely soil, furrows a foot deep may not be as desirable as shallow ones. These local questions can only be settled by examination of the subsoil after irrigating.

* * *

SMALL SPRAY PUMP.

A subscriber wishes to know where he can buy a small spray pump with which he can spray a few trees in his yard. The pump must have a good mixer attached. We would refer him to any of the seed men or implement firms which advertise in this paper. He will find just what he wants, for they carry goods of all kinds that are useful to the small grower or city-lot gardener.

* * *

KILLING WORMS IN ALMONDS.

A reader asked us the other day if sulphuring almonds would kill the worms that might be in the new crop of almonds or prevent others from infesting them. Sulphur fumes will do both, but the nuts will be ruined if they are paper shells. Sulphuring paper shell almonds will render them tasteless and give them a rancid flavor. They should be fumigated with bi-sulphide of carbon when there is reason to think that worms are after them. Place them in a barrel and on top of the nuts place a half pint of the liquid in an old can and place two or three sacks over the top of the barrel so as to confine the fumes. Leave them so until all of the liquid has disappeared. Air the almonds in the sun during the hot part of the day when no millars will be flying around and put them in a tight sack. This process will kill all millars or worms that might be in them and from time to time, examine the nuts to see if any eggs have hatched out after fumigating. If so, give them some more bi-sulphide and that will end the trouble. Hard shell almonds may be sulphured as dried fruit is, but it is too much trouble, unless bleaching is desired.

"ITS PENNY WISE"

Policy to set out a good tree, costing good money, and then let the sun burn the bark, or the rabbits gnaw it, when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 450 Santa Fe avenue, Los Angeles.

Natural gas of a bright quality has been discovered flowing from the bed of the Ojai river near Ventura, and an attempt is to be made to develop it, that it may be used in the different cities and towns of Ventura county.

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

Wc call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

We are now discussing the bugs or insects of the order Hemiptera. These, it will be remembered, all have sucking mouthparts and do not bite they rather suck the blood or juice as the case may be. Of the animals that we have discussed so far, the Crustecea or lobster group, have formidable jaws and bite. The myriapods do the same. The mites pierce and suck, and it is by withdrawing the juices or blood that these animals do their injury. The spiders and scorpions bite, but as we will remember are all our friends and so do not eat up our plants. In the class, insects it will be remembered that the lacewings and locusts are all mandibulate. They bite and eat while the bugs or Hemiptera are all sucking insects, and like the mites may suck the juices from plants or the blood from other animals. They cannot, therefore, be killed by feeding poisons, like Paris green. These, by the way, are the only sucking insects that we have considered thus far. We shall find that in this respect they keep company with the two winged flies and the moths and butterflies. The other two orders, beetles, and bees, ants and wasps, are included in the biting forms.

* * *

Homoptera.—We yet have to consider among the bugs the non-typical bugs, or those in which the front wings are much the same as the back one, and the front wings similar from one end to the other and not thickened at the base.

* * *

Family Cicadidae.—The Cicada is one of the most interesting of insects. It is here that we find the seventeen year cicada, often incorrectly called the seventeen year locust. They are large, robust, dark colored insects with broad heads, prominent eyes and sloping wings. Their song is a long sharp trill resembling somewhat the song of the katydid. The song often leads us to find the insect, which would be seldom discovered except for this. The insect does little harm except in laying its eggs. These are laid in slits made in the trees. The cutting of these slits often causes the twigs to die and thus orchards are often pruned in a way to greatly displease the owner. As the young hatches, it falls to the ground into which it tunnels. For protection, it digs deeply where the food supply is meagre and where the warmth is not sufficient for rapid development. These two reasons prolong the larval state so that in the one species they are seventeen years in gaining their full development. There is also a thirteen-year cicada and others which pass less time in the larval state. There are several places in Eastern United States where the seventeen-year cicada comes regularly. I have had opportunity to study them at Ann Arbor, Mich, and at Cincinnati. O. When the imago or mature forms are numerous in the trees, as they are apt to be in late summer, the noise of their songs is so pronounced that it is with difficulty that persons riding in a carriage can converse. A small species is not uncommon here at Claremont. Although the Cicada lives on the roots of our plants, they are so slow of development and feed so leisurely that so far as I know, they do but little harm.

* * *

Lantern Fly Family.—These insects are so named because some species, none of which, however, are native to our country so far as I know, are phospherescent, and so furnish oftimes, not a little light. Thus we have the large lantern fly of Brazil and the Candle fly of China. A common gray species, usual at Claremont, shows a marked prolongation of the head in an upward direction.

* * *

Spittle Insects, or Frog Hoppers.—Most observant people have noticed a white froth like spittle on many of our plants during summer. Careful inspection will find a larval insect in the midst of this froth. I have heard it suggested that they breathe oxygen from the foam which surrounds them. Many suppose that the spittle like substance is but the sap of the plant, which they suck from the leaves or stem and pass out from their aliamentary canal. The mature insects look not unlike beetles and are rather broad for their length. I suppose the name frog hopper comes from the fact that the foam was formerly supposed to be the product of the tree frog. Although these spittle insects suck the juices from plants, I doubt if their numbers are sufficient to do very considerable harm.

* * *

The Leaf Hoppers.—The leaf hoppers are broad headed sucking insects which are often very destructive, ranking second only to the aphids and scale insects. The grape vine leaf hoppers belong here and have done serious damage not only in California but in the East. They have been referred to as Thrips but of course are very different from these latter insects. They are often so numerous that one in passing through a vineyard will cause a swarm of them often consisting of millions to dart off from the vines. I believe that a proper use of distillate spray, much diluted and thrown upon them as they take wing might prove a very efficient remedy. I once recommended this to the vineyardists of Northern Indiana and it was practiced with considerable satisfaction. They hibernate under leaves, so the burning or stirring up of the leaves beneath the vines in the cold or damp of winter is often a great help. It was a species of these leaf hoppers that were so destructive in the vineyards near Fresno a few years since.

* * *

THE SCUTELLISTA.

As I look out the window where I am writing, two fine oleanders are full in view. A year ago these were quite badly infested with the black scale, which insects are especially partial to these plants. Through the kindness of Mr. Alexander Craw, I received a small colony of the Scutellista. These came in the early summer and were placed on the oleanders. In September, a new brood had come and the flies were found quite numerous in the trees. I collected some of these and gave them to a neighbor, who liberated them in his orange trees not far away. I take great pleasure in reporting that these little Chalcid flies have not only utterly cleaned my oleanders but have also gone onto neighboring orange, lemon and olive trees, and are doing most excellent work here. The orange trees are almost rid of the scale, the lemon tree apparently wholly, while I doubt if we shall ever be troubled to fight the scale upon the olive. The neighbor to whom I gave the insects a little over a year ago, has been able to gather and distribute a number of colonies to other neighbors of the community. Thus these little South African parasites are making their way and are putting up an excellent fight, and while I do not believe that our spraying outfit will go at present into "innucuous desueteude," yet I do believe that we may hope that the time is not far distant when we can give the fighting of the black scale entirely into the charge of the Scutellista. I would suggest that all interested get colonies of these insects and put them into pepper trees or into trees of the orchard not sprayed or fumigated and then spray the balance of the orchard. Of course we cannot yet say certainly but we have reason to hope as good things from the Scutellista as have come to us through the Vedalia. The only possible chance of failure rests in the possibility that some enemy may attack and destroy these little friends.

* * *

MONKEY-FACED OWL.

A. E. Engleheart, Glendora, Cal., desires to know how and where he can get a pair of monkey-faced owls—the owl that catches gophers and squirrels. As his orange grove is surrounded on three sides by hills, he finds these rodents a great vexation. I do not think Mr. E. needs at all to get these owls. They are thick all about us. Often during the night, I hear their screech, which, I dare say, often means one less gopher to trouble us. I wish they were even more numerous than they are, as I am assured that their principal food consists of the gophers. I think it would be impossible to catch them and keep them as we would cats. They are wild and would not submit gracefully to confinement. I think if we should even get the young and bring them up by hand, they would still cling to their wild habit and would not do as good service as they do now in the wild freedom which has ever been theirs. Our domesticated animals were not made in a day. It takes years to do the work.

* * *

SOWING BACTERIA.

Prof. C. B. Sumner has followed the wise practice becoming so prevalent in this region of sowing peas in his citrus orchard. It is now pretty late to sow and I am glad that in several orchards the peas are already up several inches. Prof. Sumner asks how we can best inoculate the soil with the desired bacteria. First, get soil where peas have been grown for a series of year. The least possible amount of this soil will inoculate the land. Why not soak the peas for at least twelve hours in tepid water. This will hasten germination and is valuable in itself. Then while yet moist, place these in a little of bacterial soil and enough will adhere to insure thorough inoculation. This as yet is all theory with me, but I believe would be the easiest way to distribute these soil bacteria.

* * *

BULLETIN ON SPRAYING.

The University Bulletin on Spraying is certainly timely and the scientific exposition will be welcomed by our fruitmen. Mr. Volk has certainly magnified the danger in the use of this valuable insecticide. If the rules which our as yet very limited experience has already demonstrated to be safe and best are strictly followed—and it is really as easy to do a thing right as wrong, if one is interested in his business, easier indeed, as it eliminates uncertainty—there need be no dropping at all of leaves, and as for dropping of fruit, I have yet to see any of that. Yet from my observation of late, I think we cannot repeat too frequently the necessity of cautious careful work. I think, however, there will be more danger from lack of thoroughness than from any falling of the leaves. Yet, as I have frequently insisted, every orchard before either spraying or fumigation, should be in the best possible condition. If Mr. Volk had been in the orchards as much as I have, he would not insist upon the necessary inferiority of spraying to fumigation, even in the orange orchard. In careful hands spraying may be quite as effective as it is qquite as safe as fumigation. Indeed, if the owner owns his sprayer and superintends his own work, it will be more effective than the fumigation is as it is usually done. I believe this matter of personal supervision is the key to the situation and the sooner our orchardists wake up to this fact the better it will be for them.

* * *

ORCHARDS INTERROGATED.

Last Monday in company with Mr. Goodrich, one of our very able, cautious, and conscientious horticultural inspectors, it was my pleasure to visit several of the orchards of Ontario, which had recently been treated for the black scale. We first visited the Allen orchard, on 5th street. This orchard was fumigated on September 3rd. In this orchard we found some of the fruit very badly burned, but evidently through no fault of the process, as the trees on which the foliage and fruit were injured were treated late in the morning, after the sun had risen, and as a very large amount of cyanide had wisely been ordered, both fruit and leaves suffered. The execution had been excellent. The orchard was grievously affected, the scale existing by the millions. Nearly all the insects were dead, yet every considerable twig that I examined, would show a very few live insects. One twig, a foot long, showed five live scale. These live scale often touched others which had been killed, and which differed from them very little in size. It is evident that these live scale had not hatched at the time the trees were fumigated. We thus learn two important lessons. We must not fumigate or spray until the insects are all hatched, unless, perchance, they hatch so unevenly that to wait would ensure some reaching a growth and development which would make it impossible to kill them. This year the scale are hatching so uniformly that it need not be difficult to do almost a perfect piece of work. I have visited Prof. Sumner's orchard twice, and I feel free to say that a thorough job of either spraying or fumigation at this time, or perhaps in some orchards will surely exterminate nearly or quite all of the scale.

We next visited the large orchard of Mr. Jones on 4th street. This orchard was sprayed on August 15. The effectiveness of the spray was fully equal to that of the cyanide in the orchard previously examined. The orchard was equally infested as one could hardly touch the limbs in some cases without touching a score of the insects. I think there was quite as large a proportion of the insects killed as there was in the other orchard, yet here as before we found an occasional live scale. Possibly there were a few more live scale though examination by actual count did not show it. Here as before, the treatment was too early. The live scale in this case also were close beside dead ones and of the same size, thus showing again that they had hatched since the spraying was done. Notwithstanding the very thorough work in this orchard, we could not detect that there was any injury done the foliage and there is no spotting of the fruit that need cause the least anxiety.

We next visited the orchard of Fred Rabe, on 3rd street. This had been fumigated on the 8th of September. Close investigation showed a very few live scale. Here again the fumigation was a little too early. The fruit in this orchard is considerably damaged by the fumigation. It is possible that here as before the work was done too late in the morning. This would seem the more probable, because other orchards where the fumigation was done in the same way, in no case were injured. I am told, however, that the night when this work was done was very warm. We can easily believe that either fumigation or spraying when the weather is very warm may need to be very carefully done not to produce any injury. Mr. Rabe feels very sore over the injury which he has received from the fumigation.

We next visited the large orchard of Mr. King, on Holt avenue. Something has spotted the fruit in Mr. King's orchard seriously. The orchard was fumigated I think the last of August. It may have been in early September. The spotted fruit is very characteristic. The injury seems deep as the cells are much shrunken, and there is sharp lines between the injured and the uninjured parts. I saw little injury of foliage. At first I thought this could not be the result of fumigation. Further examination led me to doubt. The spotted fruit is largely at the extreme top and outside of the trees and in almost every case just where the tent would touch the fruit. I am still in doubt as to the cause of the spotting. Mr. King contends that it is due to the fumigation. Others who have examined, are equally certain that it is the result of insect attack. As yet I am frank to say I do not know.

I am more and more of the opinion that spraying is bound to supersede fumigation, and that two points cannot be too greatly emphasized. The owner must look after the work, and the work must be done at the proper time. Again I urge that the orchardists own their own spraying outfit.

The Golden Harvest

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

The hop crop of Shasta county was only about half what it is in ordinary years.

Four car loads of almonds were, one day last week, shipped from Dixon to Chicago.

The immigrants arriving at San Francisco, during September, were 296 Chinese, 110 Japanese and 244 Europeans.

The value of merchandise and produce shipments from San Francisco for the month of September aggregated $4,754,531.

E. S. Gray obtained more than five tons of grapes to the acre from his Geyserville ranch. He gathered 8½ tons of Zinfandels from a single acre.

The total shipment of fruit from Sacramento by the California fruit distributors, up to October 10th, was 6436 cars, as against 6384 to same date last year.

Profesor E. W. Hilgard, dean of the College of Agriculture, had special honors conferred on him the 9th instant, because of his distinguished services in agricultural research.

On the 8th instant San Francisco voted on the proposition to acquire the Geary street railroad. The proposition failed to receive the necessary two-thirds majority. There were 14,381 votes cast in favor and 10,755 against.

It is announced that the United States has passed the 200,000 mile mark in railroad construction. The mileage of Europe is but 175,000. This year the Russian government will expend $85,000,000 in building new railroads.

There is now on exhibition in the Oakland Board of Trade rooms, a branch of fifteen pears that grew on a three-year-old tree in the orchard of Mr. J. Seulberger, of East Oakland. The pears weigh on an average half a pound each.

The freight charges on California prunes to German ports is $1.10 per 100 pounds. From France to Germany the charge is 50 cents per 100 pounds. France is a formidable competitor of ours in Germany, owing to the difference in freight charges.

The shipments of dried fruits from San Francisco, during September, were 2,744,119 pounds. In September 1902 the amount was but 873,924 pounds. The great bulk of our shipments last month were to Germany, being 2,067,738 pounds of prunes, 37,200 of apricots and 37,300 pounds of pears.

The Harriman lines employ eight lecturers in the east who exhibit stereoptican pictures of pacific coast scenery, and who distribute literature. Mr. McKinney, general immigration agent of the lines, says through the efforts of his bureau, the population of Oregon has been increased by 44,000 the past year.

One hundred farmers, from Yolo and Sacramento counties, met in Sacramento one day last week and organized a farmers' protective association. Major C. J. Berry, the principal speaker, said: "This is not an organization for benevolent purposes, but to devise ways the farmers may get better prices for the product of his labor."

The Central California fair, held at Hanford last week, was in every way a success. The exhibits included samples of all the products of that part of the state. There were 526 individual displays of fine stock, and 52 varieties of fruit, vegetables and grain. Sixty horses were entered for the races. The daily attendance was large.

J. D. Pyle & Son, of Berryessa, have canned 30,000 cases of cherries, apricots, plumbs, peaches and prunes. They are now running on tomatoes. They expect to can 8000 cans. They are drying 300 tons of prunes. They regard the Burbank sugar prune the best, because of its extra large size They will plant forty acres to this prune next year.

The Niles dryers are shipping almonds heavily now to the eastern markets.

Virginia proposes to eclipse all other states in a tobacco display at the World's Fair.

Fruit drying is so nearly finished in Northern and Central California that the people now welcome rain.

J. Garliando, near Healdsburg, has sold his crop of prunes to the Merritt Fruit Company at $92.50 per ton.

It is claimed by reliable parties that an Oregon farmer this year raised a crop of oats that yielded 118 bushels to the acre.

The acreage of raisins in Fresno county is as large as last year, but the average yield will fall 15 per cent. of that of 1902.

The tomato crop in the vicinity of Mt. Eden is very large this year. The growers there ship 150 tons daily to San Francisco.

The Niles canneries are running heavily on tomatoes now. Tons are received every day, largely from the Tyson ranches.

The Sonoma Coal, Oil and Development Company have filed articles of incorporation at Santa Rosa. Capital stock $500,000.

The grape packers of Contra Costa county indulged in a little recreation one night recently by having a grand ball at Clayton.

The raisin growers, in the vicinity of Bakersfield, are shipping their crop to Fresno to be packed. About 500 tons will be thus shipped.

It is now definitely stated that the bean output of the Santa Maria valley will not exceed 90,000 sacks, which is 60,000 behind a full crop.

Up to this date the Hotchkiss winery at Windsor has crushed 600 tons of grapes, and the California Wine Association has crushed 1300 tons.

F. C. Story, bee inspector of Fresno county, reports that he has just finished inspecting 1593 stands of bees. He has found but five foul broods.

Recently new machinery was placed in the Mt. Diablo Vineyard Company's cellar and works perfectly. Great quantities of grapes are crushed daily.

California fruits are received with so much favor in France that the government is making official inquiry for the reason why our products are invading that country.

Fourteen thousand, five hundred acres are devoted to the raising of flower seeds in California. The receipts for seeds sold is nearly three million dollars annually.

The Utah legislature has set apart one day in the year to be known as Health Day. On that day every business, home and residence is to be thoroughly cleaned up.

William Corey, of Kingstown, Mass., a wood chopper, fell ill in the timber where he was working. He subsisted well for twenty days on grapes, which were in abundance near his cabin.

It is now announced that Andrew Carnegie will provide funds to enable Luther Burbank to erect a laboratory and experiment building at Santa Rosa and provide him with two assistants.

W. L. Hopper, of Sonoma county, is recognized as a successful grape grower. He gives his vines plenty of room and manures heavily. He sold his grapes this year for $16.00 per ton.

Estimates are now being made on the second crop of muscat grapes in Central California. The shortage will be very pronounced. The crop will not be over 40 per cent. of last year's second crop.

This year the weevil injured the cotton crop of the South $20,000,000. The Oakland Inquirer is of the opinion that the entomologists of the California University might be able to suggest a remedy for the pest.

We will offer 100,000 deciduous fruit trees for sale next season

If you are thinking of planting it will pay you to give us a call before placing your order

We are headquarters for all kinds of deciduous fruit trees, nuts, grapevines, berry vines and blue gums

A day spent looking over our nursery will be money well invested

A. YARNELL,
Station K, LOS ANGELES, Cal.

The Ellsworth drier, of Niles, has at this writing, shipped seventeen carloads of dried fruit and almonds.

The Kearney Packing House is running at full blast and sends two to three car loads of raisins daily to the Pacific Coast seeder.

R. G. Dunn & Co. report for the week ending October 10th, 223 failures in the United States, as against 245 in the corresponding week last year.

H. P. Conyers, of Green Valley, sold over 100 tons of grapes from 24 acres that ran 21-22 per cent. of sugar, at $15.00 per ton. This winter he will plant several acres of Lawton blackberries.

We have the best thing yet for preserving fence posts and all timbers under water or under ground, also for all iron roofing and pipe. If you will take sound, dry posts and properly coat with our preparation the part that is to be in the ground, the fence will stand up long after you are laid out. We manufacture the preparation (protected by patent) and ship in amounts required. One hundred pounds is enough for fifty posts. Any man can do the work. You melt up the mixture in a kettle, heat it to boiling point, keep it stirred and apply with a brush, if your kettle is not deep enough for dipping. Full directions sent with every shipment. The posts are ready for use as soon as the coating cools. The process is cheap and absolutely effective. Write for prices and particulars. We want an agent in every county.

Coast News and Notes

CONTINUED

From advertising, Fresno county has attracted inquiries about the fig industry and sales of land to be devoted to fig growing are being made. Fig raising has not been heretofore carried on extensively in Central California.

Losson Ross, the orchardist of Forestville, recently sold the apples from one tree for $25.00. The fruit is of the Ben Davis variety. Mr. Ross' orchard contains 108 trees to the acre. The trees are twenty feet distant from each other.

In 1901 the world produced 209,000,000 pounds of hops and in 1903 153,000,000 pounds. The crop in the United States dropped from 41,800,000 pounds in 1901, to 28,600,000 in 1902. It is estimated that this year the crop will be still less.

On the 6th inst. the steamer Nevadan, from Honolulu, arrived at San Francisco with many thousand sacks of sugar and 1000 bunches of bananas. The Martha Davis, from Hilo, on the same date, arrived with 9600 sacks of sugar.

The dried fruit market in Alameda county, and contiguous counties, is dull. Buyers are wary and growers are in no haste to sell. Apricots at this writing are quoted at from 8 to 9 cents; almonds 9 to 10 cents and prunes are sold on a 2 to 2½ basis.

The United States annually sends thousands of dollars to Sweden for pottery made from the Pompeiian clay. Now A. W. Robertson has discovered the same kind of clay near Santa Cruz, and is successfully manufacturing vessels from it. This clay is also found in Amador and other counties.

Lumber men recently made an estimate of the annual cut of timber in the three Pacific states as follows: California supplies 860,000,000 feet, Oregon 740,000,000 and Washington 2,300,000,000. At this rate it is calculated that the forests of the Pacific coast will be exhausted in forty years.

The conditions of the anthracite coal mines are very different now from that of last year. Then there was a great strike, and the supply on hand was low. Now there is so much on hand that 60,000 men are working on half time. There will be no coal famine next winter.

At a recent meeting of the farmers' club, held at San Jose, it was stated that several growers had sold their prunes on a three cent basis. The general sentiment expressed at the convention was to the effect that the action of the farmers' club had so stiffened prices that several thousand dollars will be added to this year's profits of the growers of the valley.

It may interest foreign readers of the Cultivator to know that already more than 8000 car loads of green fruit have gone east from this state this season. Next winter about thirty thousand car loads of oranges and lemons will go, and in the fall and winter many thousand car loads of dried, evaporated and canned fruits will go east. California receives double the money for fruits than is dug out of the mines.

Latest advices from Washington are to the effect that the prune crop is light, owing to heavy rains. All other fruits were good, and were practically free from pests. One Yakima grower sold peaches to the value of $1200 from one acre. That fruit is bringing 2 cents per pound. W. A. Lafolette sold 40,000 boxes of peaches. The apple crop of the state is immense.

At a state convention of the California Grange, held on the 9th instant at San Jose, a committee was appointed to prepare a bill to be introduced in the legislature providing that all state taxes shall be derived from the income of corporations, similar to the Wisconsin law. The parcel post system was also endorsed, which California senators and members of congress will be urged to favor.

Late rains have damaged heavily the oats in shock in Washington.

A Luther Burbank exhibit is to be established at the rooms of the State Board of Trade in San Francisco.

Late storms in Mexico have wrought enormous damage to crops. The cotton crop alone was damaged over half a million dollars.

From the vicinity of Red Bluff there will be shipped this year wool valued at $150,000. At this date 851,000 pounds have been sold at an average price of 11 cents per pound.

Work on the Granger-Jackson dairy at Decoto is progressing. The milk of one hundred and fifty cows will be used by December 1.

The Germans have been experimenting by crossing the horse and Zebra. They say the result is a better work animal than the mule.

James T. Richie of Sonoma county, has applied for a patent for a remedy for foot rot in sheep. He says this remedy has proved efficient in Scotland for many generations.

During the past week the price of hay advanced in San Francisco $1.00 per ton. Fancy wheat hay is now quoted at $15.50 and $16.00. Oat hay at $14 and $14.50.

Mr. Murray, of Sonoma, is advocating co-operation among poultry men. He says he saw Petaluma eggs selling in San Francisco at 39 cents when the same eggs had just brought the Petaluma poultryman but 33 cents.

The Bodega Creamery, of Sonoma county, reports that during the past year they manufactured 146,527 pounds of butter and made a profit of $846.33 on hogs. The property is valued at $3800; cash on hand $2625.48; liabilities $1114.62; surplus $5310.86.

Ten to fifteen thousand sheep have been driven by their owners over the Sierra range into Crane valley on the forest reserves. Farmers in the vicinity have seized them, and under instructions from Forest Superintendent C. S. Newhall, are scattering them in Mariposa county.

A few days ago quite a delegation, members of the Sonoma County Poultry Association, met members of the Petaluma poultrymen in a conference meeting at the latter place, and urged upon the Petalumans the necessity of the co-operation of all poultrymen in the county. Other meetings will be held. The indications are that a general co-operation will be entered into.

A. L. King, of San Bernardino county, claims that his orange crop has been seriously damaged on account of fumigation for insect pests by the Horticultural Commission. Fred Rabe has made a demand on the county for damages for half his orange crop for the same reason. The county attorney has decided that the county cannot legally be held responsible for any damage to orchards created by the Horticultural Commission.

A large mass meeting was held at Sebastopol last week to consider how the great influx of Chinese and Japanese into that locality could be stopped. They are crowding out white laborers.

The Sonoma County Poultry Association is making a campaign of the entire county inducing poultry raisers to join the co-operative association. The poultry men of Cotati have joined the society.

On November 1 the freight rates on wheat and flour to the Orient are to be raised. The present rate on flour from San Francisco to Oriental ports is $3.00 per ton. It will be raised to $5.00. A similar raise will be made at British Columbia and Puget Sound ports. Wheat, which has stood at $4.00 for several years, will be raised to $5.00.

It is asserted that the California fruit growers have been subjected to the grossest frauds, perpetrated by eastern auction houses and commission men and fruit dealers in Europe. Wm. H. Mills has, therefore, introduced a resolution in the State Board of Trade, instructing the manager to inquire into the matter carefully, and report the facts to the end that steps may be taken to abate the alleged wrong.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

ABORTION.

Editor Cultivator: I have a fine Jersey heifer about 27 months old; had her in pasture all of this year; she dropped her calf (first one) prematurely about a week ago; I brought her home, thinking perhaps she would come to milk, but has not. I have read and been told that an occurrence of this kind with a heifer is very likely to recur. I would like your advice. Would it be wise to breed her again and wait for perhaps another whole year, or had she better be fattened and sold for meat? Kindly reply through California Cultivator and oblige.—Wm. E. Toeipl, Upland, Cal.

If you have reason to believe that she dropped her calf prematurely from contagious abortion it would probably be as well to fatten her under the circumstances, but if it was due to some accident she would very likely come all right next time.

* * *

FATTENING COWS.

Editor Cultivator: What is the best ration to feed a cow in order to fatten her for beef, 11 years old and giving milk, but I am drying her up fast as possible. In fair condition now.—W. W. Foster, Bloomington, October 12.

The most economical plan to fatten a cow 11 years old would be to give her all she will eat of the best cheap food at hand. It certainly would not pay to give her much expensive food.

* * *

MUSTY HAY.

Editor Cultivator: Will you kindly state in your valuable paper whether or not barley hay that is slightly musty can be cured so as not to be injurious to horses—causing looseness of the bowels. The hay is not so musty but that the horses eat it readily.—S. C. F., Santa Clara.

All musty hay is caused by vegetable parasites growing on it during the life of the plant, or after it has been cut. Those growing on hay before it is cut are bunt, rust, smut and ergot. The vegetable parasites that grow on hay after it has been cut are represented by various fungi, such as mucous, penicillium and asper gillus. These are known as moulds and give off spores which cause great irritation to the respiratory mucous membrane of animals. If the hay was well shaken and slightly dampened it would improve it some.

Sir Thomas Lipton has purchased 1000 acres of choice fruit and vegetable land in Southern Georgia. He is working in concert with other European capitalists, who are preparing to buy great tracts of land in the South, stock them with cattle, and raise grain and vegetables for the London market.

HORSES FOR SALE.

Some very fine driving horses and brood mares. I am closing out my stock.

P.O. Box 1, Escondido, San Diego Co., Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

LAW RELATIVE TO BUTTER AND CHEESE.

A correspondent from San Luis Obispo writes the Cultivator asking what the provisions and penalties of the law in California in reference to butter and cheese are, and also if the Cultivator will not publish the law as it stands today. The Act may be obtained by writing the State Dairy Bureau at Sacramento. It is too long to print here, but is of interest at this time when so many kinds of preservatives are used to keep cream sweet and to give it color, at least to give butter color, and when so many imitations of butter are on the market. The principal provisions of the Act provide in substance that "No person, by himself or his agents, shall render or manufacture, sell or offer for sale, expose for sale, or have in his possession, with intent to sell, or use, or serve to patrons, guests, boarders, hotels, restaurants or private persons, any article made wholly, or in part out of any fat, oil, or oleaginous substance not produced directly, and at the time of manufacture, from unadulterated milk or cream. No imitation of butter or cheese made from pure cream is permitted.

No proprietor of any hotel, restaurant or bakery is allowed to substitute pure butter or cheese with butterine, or any other compound, without due notice of such substitution to guests who may be served.

The penalty for violation of the Act is, upon conviction, for first offense, a fine of not less than $50 nor more than $150 or imprisonment for more than 30 days, and for each subsequent offense a fine of not less than $150 nor more than $300 or imprisonment not more than six months.

From the above provisions of the law it will be seen that it is a dangerous business to substitute any imitation of butter or cheese without strictly complying with the law relating to notice thereof. The law is good. Its provisions are wholesome, and its penalty for violation none too severe.

NUMBER OF PURE BRED DAIRY CATTLE OF THE UNITED STATES.

The dairy division of the United States Department of Agriculture gives the following estimate of the number of pure bred cattle living in 1903, the total number of such cattle registered, and the average value of those living:

NUMBER AND VALUE OF DAIRY CATTLE.

Breed	No. registered.	Estimated No. living.	Av. Val. p. head.
Ayrshire	25,541	8,500	$100
Brown Swiss	3,258	1,800	75
Devon	20,717	9,000	75
Dutch Belted	1,524	600	200
Guernsey	24,337	15,000	140
Holstein Fries ..	115,009	75,000	130
Jersey	237,680	125,000	100
Polled Durham ..	6,077	5,000	80
Polled Jersey	286	250	100
Red Polled	30,330	25,000	150
*Shorthorn	504,839	420,000	170

*Number and average value refer chiefly to beef stock.

After an extended trip through the state G. M. McKinney, general information agent of the Southern Pacific Company, estimates that there are 2,000,000 acres available for colonization in California.

DAIRYMEN SHOULD REMEMBER—

1. It should be remembered that the whole matter of good dairying and proper care of cows is placed in a nutshell when it is realized that you have to deal with a mother when you handle a cow, and with a baby when you handle a calf.

2. That when one is considering the question of raising the standard of the dairy herd, it is essential that he make the characteristics of the dairy breed a special study. The question of what breed to select to use for a cross should have careful study. No one can answer for another.

3. That no sensible dairyman will ever sit down to cows with teats and udders completely covered with manure and begin at once to wet the teats with the milk, while the filthy drippings go directly into the pail. This is not producing pure milk.

4. That the milk should not be put at once after milking into closely covered cans, because by so doing odors are retained in it.

5. That milk pails, cans, churns and every utensil used in the dairy must be kept most carefully clean, solely to keep out bacteria.

6. That it is but little more trouble to take care of and milk a cow giving 7000 pounds of milk a year than one giving 2000 pounds. The one who milks the 7000-pound cow will reap his reward, for the profit is three fold.

7. That no heifer should be milked before calving. Its tendency is to destroy. It is rank folly, all reports to the contrary notwithstanding. No udder was ever saved by milking before calving. The unnatural operation tends to create more inflammation.—North Dakota Farmer.

STATE UNIVERSITY DAIRY COWS

The annual short course in agriculture, horticulture, and dairying which the University of California conducts as an adjunct to its regular work commenced last week. The attendance is not yet all enrolled, but it is already demonstrated that this year's dairy school will exceed in numbers that of last year.

The schedule of exercises is announced as follows: Butter-making, E. H. Zimmerman; cheese-making, E. H. Hageman; dairy laboratory, Professor E. W. Major; economic entomology, Professor C. W. Woodworth; plant propagation, Professor A. V. Stubenrauch; sugar beet culture, Professor G. W. Shaw; California horticulture, Professor E. J. Wickson; scale insects, Professor Woodworth and H. J. Quayle; dairy bacteriology, Professor A. R. Ward; veterinary science, Professor Ward; grasses and forage plants, Professor Wickson; breeds and breeding, Professor Major; steam engine, C. C. Thomas; dairy chemistry, Professor M. E. Jaffa; milk and its products, Professor Major; feeding farm animals, Professors Jaffa and Major; farmers' business methods, C. A. Colmore; human foods, Professor Jaffa; insecticides, Professor Colby; physics and chemistry of soils, Professor E. W. Hilgard and Professor R. Loughridge; fertilizers, Professor Loughridge.

PANICULARIA.

Editor California Cultivator:-

I received a postal card stating that the cultivation of "Panicularia" would yield 95 tons of fodder.

It was stated that G W Bowser Coonsville, Cal., is cultivating it.

Will you oblige me by letting me know what you know about it.

I should like to know how 95 tons could be raised on one acre. You will oblige me exceedingly if you will answer the above. I ask you in the interest of a friend of mine. Wm. Meyer, M. D., Cula Vista, Calif.

The enclosed letter from Dr. Meyer in regard to a species of Panicularia said to yield 95 tons of fodder to the acre, has been handed to me with request that I drop you a note concerning this grass.

It is impossible to determine just what grass is meant since the specific name is not given and since there are several species of Panicularia grown for fodder. The one most commonly used in the eastern United States is the Reed Meadow-grass. (P. americana). This is a stout perennial, often becoming three or four feet high, which grows wild along streams and moist meadows in the eastern states. It is much liked by cattle and makes a good pasture grass for wet lands.

A second species is Floating Manna-grass P. (fluitans). It is found in all temperate regions of the world and, like the preceeding species, is a good fodder grass for swampy meadows.

The Fowl Meadow-grass (P. nervata) is a common native perennial which grows plentifully along streams in our own state as well as eastward along the continent but, so far as I am aware, it is not being grown in California to any great extent as a fodder grass, except in natural meadows. For further information and description of these grasses see Agrostology bulletin 14 of the U. S. Department of Agriculture.

The report that this grass yields 95 tons of fodder to the acre, cannot be accepted even by one familiar with the wonderful effect of our California soil and climate. Although the Panicularias produce an abundance of broad leaves and form a dense growth on damp lands, a yield of 95 tons would be something phenomenal.

The conditions existing in California are much too arid to make the introduction of these grasses profitable except in the region along the north-west coast and at few places in the mountains. The Floating Manna-grass and the Fowl Meadow-grass are valuable components of wild pastures in northern California and the latter extends as far south as the San Jacinto Mountains where it grows only along streams and in boggy meadows at considerable altitudes. In fact all the species of Panicularia demands a soil with considerable surface moisture for their perfect development. I do not know that any attempt is being made to extend the range of these species in California.

Trusting that this information may be of interest, I am very truly yours, H. M. Hall.

KEEP GOOD COWS.

Too many farmers are keeping cows in their herds at an actual loss. We have preached the doctrine of better dairy cows until our readers may think we have gotten the subject threadbare, but there is merit in saying the same thing over and over again, if it is a needed reform that is being advocated, and we know of no better theme to discuss with many of our readers from time to time than that of weeding out the unprofitable cows of the herd and substituting those that will produce fifty cents a bushel for the grain fed them against twenty-five cents per bushel for the grain fed to the poor ones. Every farmer should have a profitable standard of production for his herd of dairy cows, and when he finds that any one of his herd does not come up to the standard, she must be disposed of at once. As to the proper standard to set, the farmer must determine that himself. Such a standard will depend on the cost of feed and in the value of the product in his locality. By a judicious use of the Babcock tester and scales, every cow in the dairy herd can be placed on record, thus making no excuse for the farmer for keeping poor cows.—Farmers' Tribune.

HOW TO CARE FOR THE BULL.

The dairymen and farmers who handle any considerable number of cows find a bull a useful animal to own, says Wayne Dinsmore in Kimball's Dairy Farmer.

Some are content with anything that has four legs and the necessary parts of a bull. But a man who expects to make money finds it profitable to keep one with other desirable qualifications.

To the man who prefers animals of the first class mentioned, what we have to say will scarcely be of interest, for such animals need neither food, care, nor management.

To those who have good bulls the following suggestions may be of interest:

The breeding bull is kept to produce calves.

His ability to beget calves like himself depends upon his vigor and also upon the intensity of his breeding.

The latter is a more complicated question than we care to discuss here, but vigor depends almost wholly upon care, feed, and management.

Keep your bull in the best physical strength.

If he is a beef sire see that he is in good, meaty condition.

That grand old veteran, Thomas Wilhoit, condensed a world of meaning in a single sentence when he said: "Thick fleshed cattle breed thick fleshed cattle."

If he is a strictly dairy bred bull, the comment as to keeping him fleshy does not apply, for he is not built that way.

The man who allows his bull to run with the cows is adopting the easiest method, but he is foolish. More than that, he is careless of human life.

One service is as good as a dozen in getting a cow with calf, and it is just as much a strain on the physical vigor of the bull to serve one cow a dozen times as to get a dozen separate cows with calf.

It takes more feed to keep a bull in condition when running with the cows. He is far more apt to become impotent. His growth is checked and accidents involving the life of persons occur only too often under such circumstances.

Build a strong, roomy stall, in the south side of the barn, if possible.

Just outside construct a strong paddock of moderate size, say 15 feet square.

See that the stall and paddock are well drained. Then have a summer pasture of eight or ten acres enclosed with a woven wire fence, with barb wire at the top and more barb wire at the bottom.

When you build a fence be sure you have posts rather than kindling wood. Set them about one-half rod apart.

In such a pasture the bull may be turned at night, though no cows should be left in the adjoining field. Calves or steers may do no harm, but it is best not to take too great chances.

With such a stall, a paddock where he may sun himself, and exercise on pasture every night the bull should and will remain content and healthy so far as it is possible to make him.

Feed oats, shorts and bran, with some clover hay, green cane and corn fodder. Oats and bran make an excellent ration. The amount fed, of course, must be regulated by age, size and condition.

So far as the handling is concerned a few simple rules combined with common sense will suffice.

Ring the bull and teach him to lead while young.

Never tease him nor fool with his head.

Never allow him to push or bunt at you in play.

Teach him to obey you when you speak, but handle him sufficiently, by brushing him clean, to accustom him to your presence in the stall.

Above all, keep the stall clean, well bedded and allow him exercise in the pasture.

PLANT HOGS.

"I have a hog story that beats them all," said a Kansas feeder yesterday. "Last season one of my sows had a litter of nine pigs. One of them died, I gave two away, slaughtered one and sold the other five for over $100 profit."—St. Joseph Stock Yards Journal.

WHEN HEIFERS SHOULD BE BRED.

Under the above head Hoard's Dairyman says the following:

With those who value size principally in their cows the theory and practice is not to breed until the heifer is 20 or 24 months old. There is no doubt that the heifer will make a larger growth under ordinary treatment if bred at such age, but there is danger in this method, in our estimation, of promoting a beefy tendency in the heifer. With dairy cattle the main purpose is to promote, as much as possible, a pre-disposition to milk giving. For this purpose we breed for milk, and in the care and handling we give the animal we endeavor to promote the milk giving functions all we can, consistent with health and constitution. It has been noticed by close observers that if heifers, or cows even, become too fleshy they are apt to fail in breeding, or if they do conceive and have a calf there occurs sometimes a "set back" to their full and free milking function. "Fat and fertility are at the antipodes of each other," says the author of "The Transmission of Life."

When heifers are kept until they are 2 years of age before being bred they are quite apt to contract a fleshy habit or tendency. But if the process of gestation is going on with them at the same time it counteracts the flesh-making tendency and establishes the milking temperament within them. It is true that the bad results of late breeding in checking the milking tendency are not near as apparent in pure bred cattle as they are in dual purpose or beef cattle. The reason for this is that the "dairy temperament" is more thoroughly established in them by long heredity in that direction, and so holds them more steadily to the central porpose for which they are bred. But there is a constant tendency to "reversion" in the very best of families.

So, if we keep alive and strong the dairy temperament, we should start the heifer in that road as soon as she is 15 months of age. What we are after in the matter of breding dairy cattle as to constantly establish and enlarge the dairy individuality of our animals. We like to feel that all our methods of breeding, feeding, and handling are doing their best to make each heifer, if possible, a little better cow than the mother. That is the road of dairy progress. Branching off from it and leading away from the great central purpose are other paths, such as "dual purpose," the "color craze," and an economic demand for "size," etc.

A writer in the Jersey Bulletin of July 29, speaking on this question, says:

"We like them (the heifers) to drop their calves at 2 years of age. Would prefer them to freshen at 20 months than to go over 2 years. Heifers bred ever so early with us give from 28 to 32 pounds per day, and improve generally until the third calf. To be sure, they will not get their full growth until they are 4 or 5 years old, and possibly may never be quite so large as if they dropped the first calf at 3 years, but most of us know that size does not stand for everything in a Jersey cow."

Sufficient size, say 900 or 100 pounds, can be attained more surely by seeing to it that the heifer is kept growing and thrifty from the time she is born.

One of the finest feeds for conditioning and promoting growth in heifers and young cows is alfalfa. The first twelve months of the calf tells the story of its subsequent growth almost invariably. Fresh skim milk, separated on the farm, fed morning and night, with a spoonful of blood meal and a pint of oats, followed with what good alfalfa it will eat, and dry, clean quarters, will make a heifer fully large enough to breed at 15 to 17 months of age, and we believe she will make all the better cow for being started in the way of maternity at that age.

CARE OF FALL PIGS.

A great many farmers of our acquaintance says the Farmers' Review, seem to be of the opinion that the best way to care for fall pigs is not to have any. They are opposed to fall-born litters on general principles and it is a fact that a good deal of labor and care is required to successfully carry fall pigs through a long severe winter. Yet it can be done and with profit. It depends a good deal on the time the fall pigs arrive. It is evident that if they are born in August or September they will get some warm weather in which to make a start and this is most important. It is different with the pigs that come later when warm weather is gone and cold days prevail. These are the pigs that cause the most trouble and we are of the opinion that the earlier born pigs can be carried through the winter in good shape at a profit and without much trouble if the owner is a man who likes to tend young animals and can provide proper shelter.

To get a good start is one of the main objects, for without it the litters will remain weak and sickly and more readily succumb to inclement weather. When the pigs arrive the sow should not be fed lots of new corn as is commonly done, but for the first week should be lightly fed upon bran and middlings in the form of slop, and after that time may have an increase of food of this character, but should have very little corn if the pigs are to do well. While the pigs should be born in a comfortable pen and stay there until they are able to get about well the more open exercise they get after that the better, so long as the weather is not wet. When cold weather comes on shelter must again be provided and it is important that the pigs should not become chilled in going from their bed to their meals. This is a common cause of loss, so that an even temperature should be maintained and at the same time good ventilation be provided.

Sunlight is the best possible warmer and invigorator for young pigs during the winter months, but warmth is not on any account to be obtained by allowing the little pigs to sleep with adult hogs. Some claim that the adult hogs sap the strength of the young pigs, as is said to be the case when children sleep with adults, but there is little to prove the truth of this assertion. The real cause of lack of thrift among young pigs so treated is that get too little fresh air, become too warm, and so chill and become sick or puny when exposed to the cold air in getting their meals with the old hogs. The latter also are apt to take a hog's share of the viands so that the youngsters suffer. It is best to keep the fall litters by themselves after weaning time and to see that sunlight enfers their sleeping quarters as much as possible. Also that they have plenty of nitrogenous food rather than an abundance of corn, which is unsuitable at first and the common cause of indigestion and all of the kindred ills brought upon young pigs by the owner who does not understand proper methods of feeding and management.

After the pigs are three months old they may have grain in moderate quantities. By four months old the pigs should weigh at least 100 pounds and be in thrifty, growing condition rather than fat. As to exercise in winter there is much difference of opinion, but the more they get the better, in our opinion, so long as they are kept from wet and storms. After the pigs get a good start and are doing well they will be able to run out of doors on fine days and derive benefit rather than injury, but they must not be allowed to remain out of doors in wet weather. It is wet more than anything, perhaps, that gives rise to trouble in pigs. They can not stand it, and this also applies to damp sleeping quarters. Their bed should be dry and clean at all times if they are to do well, and so long as they are not overfed, not given too much corn, and always come squealing to the trough there will be little difficulty in making satisfactory gains without a vast amount of trouble and labor. Fall pig raising is all right if the man in charge knows his business.

LEWIS BRADBURY - DUARTE, CALIF.

MOST PROFIT IN THE DRAFT HORSE

Secretary James Wilson of the U. S. Department of Agriculture, recently contributed a valuable article to the horse world on "The Farmers Horse." In discussing the profits to be obtained in breeding horses the Secretary points out that the most profit is in raising the draft horse. He says:

Under existing conditions there are at least four distinct classes of horses which most farmers can profitably produce. The first and most important is the heavy draft horse, next the carriage or coach horse, the roadster horse and the saddle horse. There is a market for other classes of horses at the present time, but none of them command very high prices, and the most of them are the misfits which are bound to appear from time to time in the effort to produce horses of the four classes mentioned by breeding indiscriminately which gives us horses of poor quality undersized draft horses, and are the result of using a draft stallion on mares weighing from 1,200 to 1,500 pounds.

The heavy draft horse is one of the most profitable classes of horses that the farmer can breed. The draft colt can be bred with less risk and liability to accident than those of the lighter classes. This is partially due to the fact that the draft-bred colt is usually a quieter animal than those of the lighter classes, and thus less liable to injure itself through spirited exericse or playfulness. Furthermore, small bunches and blemishes which detract so seriously for the value of the harness or the saddle horse are not considered to be so objectionable in the draft horse. The man who educates him usually begins when the colt is two years old, and his education can be completed on the farm; .thus the farmer who breeds him can secure his real market value. In the case of the coach or the saddle horse the middleman who educates him usually reaps a much greater profit than the man who produces him. This is not true of the draft horse.

A draft horse without good feet is worthless on any market, hence good feet are the very first essential of a draft horse, or in fact, any class of horse. The hoofs should be large, round and wide at the heel . They should have width,but not be too deep or shallow. The horn should be of good quality, as indicated by its denseness. The wall must be strong and not inclined to be flat. The legs should be well set under the body and possess plenty of substance, as indicated by the quality and amount of bone and the development of the muscles on the forearms and gaskins. Weight is a very essential point. A draft horse should weigh from 1,800 upwards, the more the better, provided it is combined with quality and good feet and legs. The body shourd be deep, wide and strongly coupled, as indicated by shortness of back and the musceling of the loin. Good action is essential, as indicated by the length of stride, quickness of step and straight away movements.

Secretary Wilson states that next in importance to the draft horses are the carriage horses, or coach horses. Following them comes the gentleman's driving horse, or roadster, and last is placed the saddle horse.—Country Gentleman.

GRAINS FOR HORSES.

Barley, wheat and rye are all dangerous feeds for the horse, as they are liable to cause indigestion, colic, etc.

When these grains are fed they should be boiled and mixed with cut hay, roots, etc.

In this shape they are far less dangerous and are adapted to fitting horses for sale or show.

When fed dry they should be ground and fed with oats and bran and should not form over one-fourth of the mess at any one meal, and should not be fed more than once daily.—Farm Journal.

Home building, small farms and diversified farming are the hope of California agriculture. The dairy industry accomplishes these results to a greater degree than almost any other one thing a farmer can turn his atention to.—Chino Champion.

ANGORAS IN CALIFORNIA.

The Angora goat is coming into California to stay. In the northern and range section of the state the advent of the Angora promises to add a new and valuable stock industry. Writing of the Angora and its value, H. B. Fullerton, who has a large ranch of goats in Michigan, writes:

"A young lawyer friend of mine recently aptly termed the Angoras "the redeemers of the slashings." My attention was first called to them in this connection by an old college friend in the Department of Agriculture at Washington, D. C., just before the Bureau of Animal Industry issued their first bulletin on the Angora. He remarked that there ought to be money in clearing the old brush-grown lands of any country with them. The thought took possession of me, and I read eagerly all the literature I could obtain on the subject. I finally purchased a carload of Angoras—the first lot ever brought to Michigan. They have more than met my expectations as brush destroyers, and have proved money makers by their mohair and increase.

As brush destroyers, my Angoras have done noble work, and attracted much attention, many coming from a distance to see their work. They eat all brush and weeds growing in this vicinity excepting the mullen. They seen to prefer the maple, oak, sumach and blackberry. The sweet fern or brake, which grows so dense as to kill out all grass in many localities, they leave until the last, but then kill it effectually. From two to three goats per acre will do the work, depending on the brush growth and the season. There are many thousands of acres of fine farming and grazing lands in the choppings of northern Michigan for them to reclaim, and now that they are being introduced in considerable numbers they may justly be called, "The redeemers of the slashings."

What was done in Michigan is being started in California. The cactus fields, the low brush lands of Northern California may all be cleaned off by the Angora goat, and when this is done the mohair and the increase will make a fine profit on the investment.

The bacon hog, says the National Provisioner, has captured the public taste and left the heavy fat hog in the lurch. The packing houses demand a good bacon hog and pays well for it. The bacon type of hog has often been miscontrued, and in many cases ridiculed, but this is done more because of lack of knowledge of the real bacon type than anything else. This type does not demand a thin hog, as is often thought, but a hog with thick covering of firm flesh. It is, of course, highly important that this flesh be lean, and this will follow if the true bacon breeds are raised. The bacon hog must possess extreme length and depth. He must be smooth and evenly fleshed from the shoulders to the hips, presenting a neat and trim appearance. While to a large number of people these hogs are strangers, it would be well for every farmer to watch their progress,as they are becoming more numerous every year.

Prof. C. D. Smith, after five years' investigation of the milk question, has come to the conclusion: First, a cow yields as rich milk when a heifer as when she is a mature cow. Second, the milk is as rich the first month as it is later in the period of lactation, except during the last few weeks when she is drying up.

"Say do you known anything that will cause more real, downright discomfort than a grain of sand, or a cinder, in the eye?" Well, a drop of castor oil put in the eye will stop the pain and watering. Just try it once." Exchange.

Experts from the Agricultural Department have for some time been making exepriments in Fresno county to reclaim the soil from alkali. A drainage district forty miles square is being formed, improvements to cost $260,000. The alkali salts were brought to the surface by copious irrigation. The tract experimented on was underlaid with tiles and then flooded so as to wash the alkali through the soil and thus drain it off. —Pajaronian.

NEVER CONFUSE THE COLT.

Whatever is done with horses to the best advantage must be done coolly, deliberately, confidingly and with kindness for the best results. Whenever the horse becomes confused and excited he semingly "loses his head," which is very liable to lead to dangerous results, but just as long as he and his driver are on peaceable terms and understand each other perfectly there is comparatively little danger, even with the highest order of nervous development. As long as the horse understands that he is not to be hurt, and that directions will come in an intelligent manner, he can be relied on, but just as soon as he loses confidence in his driver he seems to take the responsibility of the situation upon himself and then destruction too generally follows. The theory practiced by the majority of the would be horsemen is to force the animal to do their bidding, whether the horse understands what it is or not. But neither men nor horses can execute any order well without understanding just how to perform the duty and this is acquired by cool, deliberate, careful and kind explanation, without fear or punishment. Well-behaved horses are the results of kind, careful handling, but dangerous horses are made so by fright and fight by those who have undertaken their training. Many of our very best and safest horses, under similar treatment, can be made dangerous animals in an incredibly short time in the hands of an abusive, inhuman, cruel horse-breaking crank.—Horse World.

TO EXTERMINATE THE CHICKEN MITE.

"I hate to go and gather the eggs," said a ten year old girl to me. "Why?" I exclaimed in surprise. "'Cause, I get covered with mites." Poor child! Their barn was swarming, henneries, brooders, full of lice and mites, for her good father's weary hands and tired limbs were folded in the sleep that knows no ending, and within a month the whole place was infested and the hens stopped laying. This shows what the mites will do. They are the most expensive enemy the poultrykeeper has. The Iowa State Experiment Station issued a bulletin in August giving full directions for exterminating the mites and I feel we cannot serve our readers better than by reproducing the article.

One of the most formidable enemies of chickens is the chicken mite, scientifically called Dermanyssus gallinae Redi. My observations have demonstrated that chickens infested with mites are exceedingly unprofitable. The cost of keeping them is increased and the income from them is very much reduced. Indeed, when very badly infested they are totally incapacitated for performing work.

The hens will cease laying. The ovaries undergo atrophy and on autopsy will be found shrunken and in a condition unsuitable for work. In several flocks on which I made observation I found that egg production was greatly reduced or altogether prevented during the spring and summer when, under normal conditions it would have been at its height.

Hatching hens will often either die on the nest as a result of the mite infestation or will leave their eggs, literally driven away by the vast hordes of mites which accumulate upon them. In case of three hens which thus died upon the nest in one flock of sixteen hens I could find no tissue change on post mortem examination which would account for death. There was, however, an anemia, or impoverished condition of the blood, such as would be produced by the sucking of the blood by mites.

Another very important feature of the evil effects of mites is the injury they do to newborn chicks. If the hen survives the ordeal to which she is subjected while hatching, the young chicks are attacked by the mites in great swarms as soon as they leave the protection of the shell, and, as a rule, the majority of them will succumb. I have known the loss of new born chicks from this cause to reach ninety per cent.

Chickens, both old and young, will become reduced in flesh and lose the energy for hunting and scratching which is so necessary for their welfare. The feathers will become roughened and drop out, the head will become pale and the chicken in every way present an unthrifty and unhealthy appearance. Broilers which are being prepared for market will not thrive well and will turn out in the end to be unprofitable, in fact a loss to the owner. In addition to the sucking of blood the mites further reduce the vitality of the fowls by biting them and disturbing their rest at night. They require more food and are at the same time incapable of converting it into tissue and energy as would be done by a healthy fowl.

* * *

DESCRIPTION OF THE MITE.

The chicken mite is commonly considered a form of insect life, although it is not, properly speaking, an insect. It is sometimes called the chicken tick or poultry tick. It would probably be better to apply the term tick to this parasite and reserve the word mite for the true itch mite of chickens, the Sarcoptes mutans Robin and Lanquetin. The mite has an average length of one-twenty-fifth of an inch, and its width is about four-fifths of its length. It has eight legs, by menas of which it can move very rapildy from place to place. In color it is light gray with small dark spots showing through the skin. About one in fifty or one hundred shows a distinctly red color, varying from a light to a dark red. This red color is due to engorgement with blood. The common white louse of the hen, Menopon pallidum Nitsch, is longer than the mite and of a yellowish white color.

The mites are of peculiar and stealthy habits of life, rather unlike that which one naturally expects from a parasite. Indeed, they are only semi-parasitic, and, as a rule, only remain upon a fowl long enough to secure a meal. (They are very active in their movements and seem to be ever on the lookout for a victim. On account of their vigorous and vicious habits they may be styled the wolves of the insect parasites of fowls. The mites hide in crevices and under objects in the hen house during the daytime while the chickens are outside and lie in wait for their return. They lay their eggs and the young are hatched in these hiding places. A barrel affords an excellent hiding and breeding place as the mites lodge between the staves and under the hoops.

In the nests they are to be found under the straw or other nesting material. It is a noteworthy fact that a place which shows only a few mites on the surface may contain vast numbers in the crevices or under objects. Often they become so plentiful that they overflow the hiding places and appear in hordes on the exposed surfaces. I have observed them so thickly settled as to cover the upper surface of an inch board and down the sides for a distance of two inches throughout four feet of its length and at the same time in almost as great numbers in neighboring places. On one occasion when the upper border of the next box was covered by mites as above described a hen went upon the nest to lay. Within ten minutes I noticed that at least three-fourths of the mites had left their position on the box. On lifting off the hen and examining her I found her to be swarming with mites.

* * *

INTRODUCTION OF MITES INTO A FLOCK.

In one case I was able to determine with certainty that the mites were introduced into a flock by a rooster that had been bought in a neighboring flock which proved on examination to be badly infested with mites. There is no doubt that mites may be carried from one premises to another upon all sorts of intermediate bearers.

To provide against infection of a flock in this manner any new fowls which are brought in from infected premises should be quarantined and treated by dusting with pyrethrum powder until all the mites have been destroyed.

(To be continued.)

ANSWERS TO QUESTIONS.

Editor Cultivator: Will you please answer the following questions in the columns of the Cultivator?

1. Which is the best way to ventilate a hennery?
2. Is it a good idea to have the hens' nests connected with the hennery?
3. Is the Brown Leghorn a good layer?—M. E. N., Santa Ana.

1. Bottom ventilation is the best. have the roosts above the opening so there will not be a draft on the hens—I prefer for this climate a house to stand up on four corner posts and have a free circulation of air underneath.
2. No, keep the nests away from the hennery and keep one moth ball as big as a small marble in each of the nests to keep out mites, lice and fleas.
3. The Brown Leghorn is an excellent layer.

Some of my chickens are afflicted with a peculiar trouble I do not understand. Their legs swell up to about three times their natural size and present a pink color. No fowls have yet died from the trouble. What is the disease and what the remedy? —John L. P., Alameda.

It is difficult to diagnose a case without more detailed description. I can only suggest that your fowls have rheumatism. If this is the case they will be lame, with spasmodic jerking of the legs, indisposition to remain standing, and refusal to walk. Treatment.—The buildings where the fowls live should be thoroughly dry, clean, free from draughts. The birds should have a change of ration with plenty of green food (lawn clippings, etc.). Begin treatment with a dose of Epsom salts, 20 to 30 grains (a quarter of a teaspoonful). The following day add half a teaspoonful of baking soda to a quart of drinking water, and give two or three grains of salicylic acid twice a day. Bathe the legs with the following: One cup vinegar, one cup turpentine, one tablespoonful saltpetre; keep in a bottle, shake before using. This is the greatest relief for rheumatism in the human family.

* * *

1. Will you kindly say whether oil meal has any value as an egg producer.
2. I have crossed Plymouth Rocks with White Leghorns, will the pullets make good layers?
3. Will you give prices on White Plymouth Rocks?—G., Claremont.

1. Oil meal is the refuse left of the linseed from which the oil has been extracted. A small quantity can be used, but the hens do not relish it. It helps the moult. I much prefer cotton seed meal, the hens like it better and it is cheaper. It has almost as much protein in it as meat and bone scraps.
2. The pullets of a first cross of Plymouth Rocks and Leghorns will be excellent layers, but their offspring will not be as good. The cockerels of the first cross will develop young and make fine fryers.
3. See my ad. in Cultivator or write me, not forgetting to give your name and address.

* * *

Editor Cultivator: I am a beginner in the chicken business and a new subscriber to your paper. I have bought a place with about fifty hens on it. Please tell me how to feed them. Had I better go in deeper? Some of my hens have looseness of bowels, the discharge is watery and green. What must I do for them?—Miss L., Redlands.

First take the sick away from the others, put them in a hospital by themselves, or better still, as you are a beginner, kill all the sick and bury them deeply, spray the yards and houses with a 5 per cent solution of carbolic acid and water; see that the hens are clear of lice, and keep the houses clean, and for a month put every other day a piece of blue stone as big as a bean in a quart of water for them to drink. On alternate days give one of the liquid roup cures, the Pacific is good, in the water—and one of the good poultry tonics in their mash.

I feed my fowls in the morning grain thrown in their scratching pens in deep straw, at noon green food, either green lawn clippings, or alfalfa, or cabbage, lettuce, beets, melons, pumpkins, and for the last feed about four o'clock as much mash as they will eat. You can put table scraps in the mash, mine is varied frequently, but the foundation is 2 parts bran, 1 part ground barley (or corn), 3 parts clover or alfalfa; to this is added a little salt, charcoal, shell grit, occasionally a little pepper; the mash is mixed every day.

I would not advise you to go in deeper until you have gained some experience.

POULTRY NOTES.

Wheat and oats make one of the best general diets for fowls.

If hens develop the feather pulling habits send them to market at once.

Poultry balance their own rations, if they are given a variety of feeds to select from.

HANDLING BROODY HENS.

During the summer, hens of large breeds often give a good deal of trouble by their persistence in following the maternal instinct.

Many eggs are broken and spoiled by broody hens crowding into the nests with layers,

The best way, of course, is to let the hens have at least a chance to hatch a brood of chickens, even if taken away from them when hatched.

But the broody hens should be taken and kept off the nests intended for layers anyway.

If broken in the very beginning of their sitting desire, they will soon go to laying again, thus adding them materially to the egg yield instead of diminishing it by breaking or helping to break eggs in the nests.

Our way of handling broody hens is as follows: We have a small yard enclosed by a high poultry wire fence, with a pole for a perch across one corner.

As soon as a broody hen is found on the nest at night she is taken off and taken to this yard.

Should she be light on the wing, and manage to fly over the eight-foot fence, she is taken again as soon as found on the nest and put back after one of her wings has been clipped just enough to prevent her from succeeding in her flight the second time.

Here the broody biddies are kept well supplied with food and fresh water.

Every third day the door is opened in the afternoon or evening and the hens allowed to come out.

Most of them will go to their regular roosts at night.

Those that return to the nest to sit are again taken off and confined in the yard for another three-day period.

This will usually cure them.

We find this by far the easiest way to handle broody hens during the summer and early fall.

It avoids bad temper, bad language, waste of time on the hens' part, and a material increase in the egg yield.—Practical Farmer.

Green food in winter is becoming quite the thing to give our poultry. How about the summer? Are the yards bare of grass? Then dump all the weeds from the garden into the yards. Give green food in summer and gain in the health of your birds as well in the increased egg yield.

It is refreshing to see the changed standpoint that some of the poultry papers are taking in regard to utility poultry. Large average egg yield and plump poultry do prove factors even in the producing of fancy birds.

To produce eggs in winter hens must have warm, comfortable quarters good food and plenty of it. In feeding for winter eggs, hens should have a warm mash in the morning for this nothing gives me better returns, for the money invested, than poor beans boiled two or three hours and mixed with bran. They should not have all the mash they can eat, but should be hungry enough after eating to scratch for grain thrown in litter.

If there is anything known that will start hens to laying it is cooked lean meat, chopped fine, writes P. H. Jacobs. An ounce daily to each hen is sufficient, with half an ounce of chopped, scalded clover and one ounce of bran. Something depends upon the age and condition of the hen, however. In winter corn or wheat may be given on very cold days. It is best to allow soft food but once a day, giving whole grain in a manner to compel the hens to scratch and work. If the hens are fed in the poultry house, which is often the case in the winter time, the grain should be scattered in a litter, so that the hens will have to hunt for it. Exercise is the most important essential, especially in the cold weather, for it is then that the hens require heavier food to keep them warm, and if exercise is not induced the food will be converted into fat instead of eggs. The matter of feeding is one that cannot be understood except by experience. It is a well-known fact that a hen will fatten more readily than a growing pullet, and a laying hen requires more nitrogenous food than one that is not laying. The amount of food given is no evidence of the digestible capacity of the fowl. Some hens eat less food than others, yet digest more. It is these several factors that serve to render it difficult to select a ration for the flock. The individual characteristics of the birds, their conrange, confinement, and even the grit, dition, age, breed, shelter, kind of are matters, that regulate both the quality and the quantity.

A RIVAL OF PLYMOUTH ROCKS

The Plymouth Rock breeds of chickens have always been a thing to tie to, and it takes a very good kind to excel them, but I believe they are not in it with the Rhode Island Reds. The Reds are hardier, better layers, and a better table fowl than the Rocks.

The fact that they are hardier makes them better layers in this climate, where the winters are so long and disagreeable; and in a warmer climate they do not get deseases as easily as other folws, hence they lay the year 'round.

The Rhode Island Reds are a new fowl and, as the name infers, they originated in the little state of Rhode Island. They are a specie of the Buff Plymouth Rocks. In size they are about like the Rocks. The male birds are a chocolate red color with a few black feathers and the females are a shade lighter. They are a smooth, plump fowl; always active and very rarely sick. For a table fowl they cannot be excelled—their flesh is like butter and they have a nice, plump breast.

During the past few years some of the leading poultry raisers have become aware that the Rhode Island Reds are an excellent fowl for profitable poultry raising, and they have grown very popular in a very short time. They are now in demand and bring the highest prices everywhere.

Prior to this time little attention was paid to this breed and they nearly became extinct. After Plymouth Rock craze came on people knew no other, but the wise poultry raiser of today sees that he must get a hardier kind to meet the demands of all climates. Mrs. Cromwell in Successful Farming.

POULTRY YARD PICKINGS.

The poultry raiser and his fowls must have plenty of grit—and that's no josh.

Hens and pullets may lay as well without the attention of a male bird as with it.

Ten cents a pound is about the average for hens in the market for the whole year.

One of the very best rations to feed the young chickens is coarsely ground oatmeal.

Silver-penciled Wyandottes are making a reputation as layers. The Hamburg blood in them is responsible for this, no doubt.

Eggs will absorb flavors almost as readily as milk does. This fact does not seem to be well understood, but should be remembered.

Because the hens begin to fall off in laying at this season do not forget to take good care of them. They are simply taking a brief rest.

Remember that to be a good exhibition bird one must be strong and perfectly shaped. No poorly kept bird ever comes up to these two requirements.

The best breed of fowls on earth will produce only scrub results if neglected, and a scrub flock will more than pay its way if given conscientious, intelligent care.

More and more the general public is coming to realize that there is not so much difference in breeds of fowls as there is in the people who take care of them.—Commercial Poultry.

Poultry Review—Many small chicks and some old hens are troubled with an irritation of the eyes that causes the eye lids to stick together. The cause seems to be dust blowing into the eyes. Some go out all right in the morning, get a crop full and after taking a nap cannot open their eyes again. The only remedy we know of is to oil the eyes of affected chicks and give shelter from the wind. Some blind ones will follow the hen by her voice till worn out. Badly affected chicks should be kept in a coop till they have recovered.

* * *

On any farm there is simply no excuse for not furnishing shade and plenty of water for the poultry in summer.

ROUP AND CHOLERA

Say! Mr. Poultry Raiser? How about your chickens? Are you bothered with Roup and Cholera in your flock? Have you tried everything from "Pink Powder for Pale Poultry" to the magnetic treatment, without success?

PALMERS POULTRY PP POWDERS

Trade Mark

We have what you've been looking for — a guaranteed cure for Roup and Cholera—something that cures in every case if used according to direction. Palmer's Poultry Powders—the only infallable remedy ever offered the public for Roup and Cholera. Manufactured in your own State by the

PALMER POULTRY POWDER CO.,

102 South Spring St. Los Angeles, Cal.

Palmer Poultry Powder Co.,
Los Angeles, Calif.

Gentlemen: One of my neighbors recommended your roup remedy and I used it on my chickens. They are now entirely well, and I can't speak too favorably of it. I tried seven remedies in three months without satisfactory results, but from now on your roup remedy will always find an admirer in me. Respectfully,

MRS. LIDA STANLEY,
143 East 18th Avenue, Los Angeles Calif.

Los Angeles, Calif., Oct. 5, 1903.

This is to certify that I have used Palmer's Poultry Powders for roup and cholera with gratifying results. My chickens had both roup and cholera. My husband brought home a sample of both remedies, which I used, and now have no disease among my chickens. I can't recommend it too highly. It is all it is advertised to be. I would not take ten times its price and be without it.

(Signed) MRS. T. F. MINOT,
942 W. 32nd St., Los Angeles.

Palmer's Poultry Powder Co.,
102 So. Spring St., Los Angeles.

I started in the chicken busines in a small way almost six months ago, and found roup a barrier to my flock until last week, when a friend asked me to try your remedy as it was sold under a guarantee. I followed her advice and today my chickens are in a healthy condition and no trouble whatever. I'm glad to express my gratitude to the manufacturers of the wonderful roup cure and gladly recommend it to others.

J. T. MIKLEMAN,
Anaheim, Calif.

Oct. 4th, 1903.

To all whom this may concern: I hereby certify that I had both roup and cholera among my chickens. Two doses of Palmer's roup remedy cured my chickens of roup and the cholera remedy was equally effective. I don't think Palmer's Poultry Powders has an equal on the market today, and I would not be without it while I keep fowls for three times its price.

(Signed) E. T. RIDGEWAY,
1000 Maple ave.

MADE BY PETALUMA INCUBATOR CO. PETALUMA CAL.

DINUBA, TULARE COUNTY,

Another Rich Section, where the Farmer and Fruit Grower are happy and contented * * * * * * *

It is something of an eye opener even to one who has seen much of this state, to drop into a community of which little has been heard before and find a vast stretch of rich and productive land being brought under cultivation and made the location of many prosperous farmers.

The great San Joaquin valley has always been referred to as the location of vast resources and of wonderful latent possibilities, but its very vastness prevents proper conception of what it can do—is doing—when considered as a whole. But a few days in the delta lands of the San Joaquin, where some of the richest lands in the world is being reclaimed from the tules, or in the grain fields of Stanislaus, Merced or Madera counties, or in the greatest raisin section of the world, about Fresno, or the rich dairy and stock sections of lower Fresno and in Kings and Tulare counties, all give a view of California's future greatness more than an attempt to absorb the whole.

It was a pleasure to the writer, a few weeks since, to visit one of the newer developed sections in the extreme northwestern part of Tulare county. It was Dinuba, thirty miles southeast of Fresno, on the east branch of the Southern Pacific and within three miles of the station of Sultana, on the Santa Fe. But a few years since it was a great grain field or range for stock. Now it is springing up with fruits, alfalfa fields, prosperous-looking homes and a busy town with its banks, newspapers, business houses, and a fine fruit packing house. Within the past four or five years this town has grown to a population of over a thousand. This growth has been induced by the rich surrounding country. One of the most enthusiastic Dinubians is F. H. Wilson, of the Fresno nurseries. Mr. Wilson still keeps the yards at Fresno but the growth of his business compelled larger acreage for the growing of nursery stock. He purchased 320 acres, a strip a half mile wide by a mile long, one end of the farm coming into the town of Dinuba. On this end the home is built, looking down the principal street.

Mr. Wilson took us in the buggy and first we inspected his nurseries and its no slang to say they're simply great. Rooted vines of raisin grapes, wine grapes, table grapes in fields that stretched out till they seemed to almost reach the horizon. There are several blocks of resistant vines, as well as the many others.

In the little cut, the center one on this page, appear one of the blocks of vines, while on the opposite side of the drive is a block of peaches. In the cut below and to the right is the block of fig trees, while to the right of it is the block of apples and pears.

At the left is a vine, only three years old. The clusters of grapes, the Red Emperor, are mammoth and so closely massed on the vine as to look as if nature had been assisted by placing in an extra bunch or two. But those bunches hang just as they grew, excepting that a few leaves were removed to allow a look at the fruit on this one side of the vine. The other picture is of Mr. Wilson's home place.

Regarding the nursery stock which Mr. Wilson has grown it may safely be said that no finer stock can be found and in quantity and variety the planter will not be embarrassed, no matter what his desires.

In the drive over the town and surrounding country Mr. Wilson took no little pride in showing the advantages especially the great productiveness of the soil. Water seems easy to secure, as was proved by the strong well which supplies Mr. Wilson's nursery with abundance of water.

The water, by the way, is so near the surface that alfalfa is grown without irrigation. Dairying is largely followed and a good creamery takes care of all the surplus milk.

Fruit is the one most important product and one packing house will this year put out over 450 tons of dried 'cots, peaches and raisins. Speaking of raisins reminds us of some of the handsomest raisins we have yet seen. They were grown and cured by W. B. Nichols at his ranch some two or three miles out from Dinuba. The grape is the Thompson Seedless, but the manner of treatment gives an almost white and a beautiful raisin. The manner of treatment is first to dip the grapes, when first picked, in a boiling solution of water, castic soda and olive oil. After draining they are sulphured, much the same as 'cots or peaches, though not so long. The drying then takes but a comparatively short time and the result is very attractive to the eye. To the taste the finest fruit was that which was treated in the boiling bath, but not sulphured. This fruit is a beautiful amber and very sweet. It should sell for enough to more than cover the cost of dipping.

As noted, the sulphured fruit is very light and of beautiful appearance, but the taste has somewhat of peculiar acid flavor which comes to sulphured fruit. The old vines on Mr. Nichols' place were a sight to behold as to the amount of fruit which was being picked at the time of the visit.

Another product which Mr. Nichols takes much pride in is olive oil. He manufactures and bottles in an attractinve way a product which is not only pure but of a high grade of perfect flavor.

Besides the fruits noted there are grown at Dinuba some oranges and lemons. The conditions for these fruits are not so good as at the Porterville-Lindsay-Exeter section, and no particular claim as a citrus section is made.

All in all Dinuba is all right, bound to have a great future and proof of the possibilities which are lying on all sides. Just one of the eye openers which show that California is a great state.

Few scenes at Miramonte, Dinuba, where the Fresno Nurseries are located.

GRAPE GROWING IN CALIFORNIA

(Continued from first page)

January or February, leaving not more than two or at the outside three canes, and these should be cut back to two buds, and left in such shape that the vine will make a symmetrical growth. The prunings so cut off should be removed to the roadway between the vines and burned, care, of course, being taken to cover up the vines in the immediate vicinity so that they will not get scorched.

Pruning being finished, the next operation is the spring plowing. This may be left till late in the spring, after the weeds have got a good start, when two objects are accomplished. The weeds are prevented from seeding, and they act as fertilizers for the vineyard. The spring plowing, therefore, should be done the latter part of February or early in March. It matters little whether the furrows are turned toward or away from the vines but in cross plowing the furrows are always turned from the vines. Cultivating follows plowing and is kept up at regular intervals through the season. In cases where it is necessary to irrigate the cultivator is run through the vineyard after each application of water. The care of the vineyard the third year is a repetition of that of the second, and this year there should be some returns, while in the fourth a paying crop should be had. When the vine has reached its bearing age, at four years, a good many vineyardists practice summer pruning. Every year in June it is the custom to go over the vineyard and cut back the long canes to about three feet in length. This causes them to spread out new laterals, filling the spaces between the vines and serving to protect the half grown grapes. Others claim that there should be no summer pruning, as it produces a heavier second crop, detracting from the quality of the first and in weakening the vine for the next season's crop.

Of varieties, the Flame Tokay is far and away in the lead as a shipping table grape. Its large bunches, bright red color and large berries makes it an especially attractive fruit in the eastern market, while its solid flesh, and good keeping qualities make it one of the best grapes for packing. The rapid growth of the vines, their enormous yield of fruit and the fact that they will thrive under any conditions suitable to the vine, make it a favorite with the growers. Another thing in its favor is that, while it can not be classed with the resistant vines, it is so strong that it will withstand the attacks of the phylloxera, very much longer than any other than the resistant group. The Tokay will do well on any good grape land, but the best results are obtained from a clayey soil, as on this character of soil they attain to a greater degree that deep red color which is their charm as a market grape.

Next to the Tokay, as a shipping grape, is the Cornichon. This is a very large, oblong grape, deep purple in color, with large, loose bunches, comes in late, and is an attractive looking grape in the market. The Emperor and Black Hamburg, follow in order among the black grapes, and, while the Hamburg is one of the most delicate of the table grapes, it has not the good shipping qualities of others named. Among the white grapes the Muscat is a favorite in the market.

As to the cost of bringing a vineyard into bearing we cannot do better than to quote the figures of the Miles, Whitaker & Ray Co., who have in the past few years planted out an immense area to vines around Galt, in Sacramento county, and have kept careful accounts of the cost:

FIRST YEAR:

Plowing	$ 1.50
Harrowing and marking	.50
Planting	1.50
Cultivating (5 times)	1.50
Hoeing around vines	1.50
Cuttings	.75
Total, first year	$ 7.25

SECOND YEAR.

Plowing	$ 1.50
Cultivating (5 times)	1.50
Hoeing	1.50
Pruning	1.50
Total, second year	$ 6.00

THIRD YEAR.

Same as second	$ 6.00

Total cost for three years....$19.25

The figures are given for the acre and represent the bare cost of planting and bringing a vineyard into bearing where the work is done on a wholesale basis, to this of course, is to be added the cost of land, buildings, utensils, taxes and interest, which will increase the total by a considerable amount, but the figures are valuable as a basis upon which to estimate the cost of a vineyard in Northern California

In regard to the profit which may reasonably be expected from a bearing vineyard we have the figures of Col. Weinstock, of Sacramento. Col. Weinstock is a thorough business man, and has conducted his vineyard, and he owns one of the largest in Sacramento, on the same principle upon which he conducts his mercantile affairs, keeping an exact account of everything. The figures given are for ten acres of table grapes in 1901:

RECEIPTS.

1735 crates table grapes .84554 per crate	$1,467.01
78,927 lbs wine grapes, $13.50 per ton	532 75
4,444 lbs culls at $10 per ton	22.22
Total	$2,021.98

EXPENSES.

Balance water, 1900	$ 3.00
Sulphur and twine	4.51
Irrigation, water, etc.	219.67
Taxes, changing pipes, etc	62.70
Cost of harvesting and shipping table grapes	437.67
Cost of harvesting and shipping wine grapes	126.21
Cost of crates and baskets	193.04
Supervision	97.57
Total	$1,144.37
Net profit	$877.61

The following table gives in detail the items of expense:

CARE OF TRACT.

Pruning, etc	$ 42.07
Plowing	35.00
Cultivating and harrowing	20.00
Hoeing	10.95
Care of vines ditching, irrigating, etc	65.40
Water for irrigating	27.00
Pipe rent	19.25
	$219.67

HARVESTING.

Picking and packing	$ 437.67
Crating	193.04
Picking and delivering wine grapes	126.21
Addition to packing house, boxes, etc	51.57
Express	1.75
Taxes	9.03
	$819.27

The yield from this tract was sixty-three tons, or 6.3 tons to the acre.

The California Northwestern Railway Co. has had a very successful season with their Fish Hatchery and Spawning Station work, at Ukiah and Willits in Mendocino county. The backward spring retarded the seasonal run of trout at their spawning station about one month later than usual, and fears were entertained that the catch would prove very light, but the copious rain fall during the early part of March changed conditions materially, and resulted in a very successful catch of eggs, amounting to over a million. The fish taken at this station are of the "Rainbow" variety, locally called "steel head" and are considered among sportsmen to be the finest variety of trout on the Pacific Coast.

WHEN WE MUST PART.

When you must pass beyond, dear heart,
Into the realms above,
Will you somtimes think of me,
And of our endless love?
Oh! will our spirits still commune,
And seem to e'er be near?
Unless 'tis thus, oh how can I
E'er be resigned, my dear?

The world will, oh! so lonely be,
When you are not around.
No happiness for my sad heart
On earth can then be found.
Oh! how the thought of parting love,
My soul with anguish fills;
'Tis hard to feel that it is all
As our dear Father wills.

We wonder why two hearts in one
Cruel death must separate,
And why to both go home at once
Could not be love's blest fate.
No, no! our spirits cannot part;
Sweet memories remain
To keep you in my heart, till both
Shall life eternal gain.
—Martha S. Lippincott in the Gentlewoman.

FOR LOVE AND LIFE.

"Which shall it be?" Howard Merton was asked that morning as he helped Carol Grey into the saddle, "the wood road up the valley?"

"Neither," she answered with decision. "We will go on the cliff path."

* * * * * * *

It was to be their last ride together before Carol left for Europe, and the last chance he would have to be alone with her, and to ask again a certain question.

Now they had come out on the cliffs, with the lazy waves breaking against the rocks 100 feet below them. As far as the eye could see the ocean stretched sparkling and dancing in the sun.

The road was a mere path skirting the edge of the cliffs, gullied and worn by storm, and Merton was right in calling it dangerous.

"Isn't it glorious!" the girl exclaimed, but Merton did not heed the view.

"I wish you'd answer my question," she said.

"Please don't commence that again, Howard. Is it any use? Don't spoil this last ride."

"It's just because it is the last ride. Spoil the ride. How about spoiling my life? Do you ever think of that? Can any man give you more of love, of devotion?"

"I do not know yet," she answered, lightly. "O, dear! why will you continue, Howard? I know all you are going to say. I will tell you that I like you. Why isn't that sufficient?"

"Because I happen to love you. Will you ever know what love is?"

Carol turned and gazed off at the ocean, as if considering. "No," she replied, "I've read of it and heard of it, but I can't understand, and never shall, I suppose. We've been good friends this summer. We've had a jolly time together—until you fell in love with me and spoilt it all."

"I couldn't help it; and I've thought at times that there was some hope—fancied that you really cared. You shall care!" he cried. "You must."

The girl flushed and her mouth hardened a bit. "I won't!" she replied. "I don't want to care. If I loved you then good-by to freedom, good-by to my own will. You would control me as I do this horse of mine—or you would seek to, and there would be continual conflict."

"But you needn't, and besides, if you cared—"

"If I cared? I suppose I wouldn't mind then, but do I care?"

"That's what I want to know."

"I'm afraid I don't—at least not enough to give up my own will to yours. I want to continue as I am. Here I am, young, free, with all the great, wide world before me to see, and you ask me to give it up."

"I don't ask you to give it up. Go abroad, see the world, take your pleasure; only leave me some hope."

The girl gave an impatient shake of her head. "I should feel as if I were a tethered animal if I did," she said. "I hate the thought of being mastered."

"And yet one of us must control."

"That's it. If we were married. I would want to rule everything—and if you let me I would hate you. Ah, well, let's not talk of it any more. I'm for a gallop."

"Along here! Nonsense!"

"But I will. I want to."

"It's too dangerous."

"Are you afraid?"

"Yes, for you, and I won't let you risk your life."

"You can't help it," Carol replied "I'm going to. Danger is the spice of life." And as she spoke touched her horse lightly and trotted ahead. Merton quickened his pace.

"Don't Carol!" he cried, but she only laughed. "I'll tell you what," she said, looking back at him, "here's a proposition. I will race you to Bald Knob, and if you catch me the prize shall be—the promise you asked of me. My freedom against yours. Who loves me follows me."

She flung the words back at him, and before Merton could gather up his reins she was speeding forward over the rough bridle path, her body bent forward over the horse's neck.

For a moment Merton hesitated, the next he dashed after her, all his thoughts concentrated on the flying figure ahead. She turned once and smiled mockingly back at him. Her scarf streamed out behind her, her hat was off, and her hair, unbound, whipped her neck.

"Jove, how she can ride!" thought Merton in admiration. "What courage! What will! Ah, if a man could but conquer her—could but win her!"

He drove the spurs into his mare and she leaped forward. The road flew past like a narrow, white streak; all he could hear was the quick thud of the horses' feet. Faster flew the black horse and his rider as they heard the sound of the nearing hoofbeats, and faster flew the bay mare.

Little by little Merton gained. Nearer and nearer he came, watching for a chance to pass the girl, and then claim her promise. Bald Knob was in sight, jutting out into the sea, and Merton made a last effort.

He pressed forward, urging on his mare by whip and spur and spoken word, and then, as he came abreast, he saw that the girl was tugging at the reins, trying her best to stop her mount. The black had taken the bit in his teeth and bolted. It was no longer a race, but a runaway on a narrow, stony path, bordered by steep cliffs.

If Carol could keep her maddened horse in the path she would be safe unless he stumbled—if not—

Then of a sudden Merton's heart gave a jump. He remembered that the cliff at one place ahead had given way, leaving a chasm right across the road—and the woman he loved was riding straight to her death unless he could stop her.

"Pull to the left!" he shouted. "Quick! The break in the cliff-"

Even as he spoke Merton saw the yawning gap just ahead. There was but a moment to act. He leaned over and caught the girl around the waist. "Free your foot," he cried and as she did so, he lifted her from the saddle by main strength and swung his mare to the left as the black horse thundered on riderless and plunged over the chasm.

There was an instant's suspense, and then Merton's mare stumbled, went down in a heap, and Merton knew no more.

When he came to he was lying on the grass by the path side, his head supported by Carol's arms, and her lips against his.

"My darling! My darling!" he heard her cry. "Have I killed you? O, forgive me! Now, when it's too late, I know what love is!"

But it was not too late.—Indianapolis Sun.

THE OLD STORY.

The old story of a heart-broken young wife, made so by a thoughtless husband, who in a moment of petulence railed at his wife because she could not cook to suit him, as his mother used to do, has again been repeated in cases of suicide lately reported in this state. The Fresno Democrat, whose editor warmed up by the ingratitude of some cad of a husband, writes:

"A pathetic case of suicide was that of Minnie During in San Francisco a few days ago in her wedding gown and jewelry. She was the wife of a letter carrier and had married him only a few days before the first tiff came with her husband. They had quarreled about her cooking and the wretch of a man had, like so many before him, thrown his mother's ability as a cook into the face of the poor little bride. When he expressed himself disgusted with the wedding bargain, she cried out, 'Oh, Frank, you don't mean that, do you?' He answered savagely that he did; the heart broken bride left the room in tears muttering. 'I have nothing to live for,' then collecting her little love tokens, turned on the gas and next morning was found dead, the tear marks still begrimming her cheeks. In this case very likely the woman was over sensitive, but this everlasting nagging of young and inexperienced wives on the subject of a mother's cooking is as fruitful a cause of heart pangs and domestic discord as a mother-in-law's interference. As regards this San Francisco letter carrier's case, he may go through life with the fearful thought on his mind that he was morally the murderer of that supersensitive little bride. May he choke to death when he next tastes of his mother's cooking."

TO PREVENT MOTHS.

To prevent moths in blankets, sprinkle shavings of yellow soap among their folds before storing them away. The soap can be easily shaken out when the blankets are to be used, and in the meawhile it will save you much worry and anxiety, for moths will not go near it.

TO CATCH FLEAS.

Two or three sheets of fly paper spread out under the bed will catch all the fleas in the bed, when the mattress is turned, and also from the carpet.

Willie had been to Sunday School. At luncheon grandma passed him the deviled ham. "No, thank you," said Willie. "I have renounced the devil and all his works."—Springfield Republican.

Recipes...

GRAPE RECIPES.

Grape Jam.—Stem and seed your grapes, put on to boil. After boiling down one-third add cup for cup of sugar and boil until thick. This makes a delicious jam, however it is greatly improved by the addition of English walnut meats, chopped fine. About one cup to ten is the proper amount.

* * *

Canned Grapes.—Seed your grapes, make thick syrup same as for any fruit, drop in grapes and cook for a few minutes. Seal in cans hot. The Muscat grapes put up in this way make a very fine sauce.

* * *

To Seed Grapes.—The only satisfactory way we have found to seed the white grape is by cutting open with a knife. The use of a colander in seeding is wasteful, as it uses up too much of the skins, which in jams or canned fruits cook up to be as good as the pulp.

* * *

STEAMED RICE.

Wash and drain the rice thoroughly and put it in a double boiler; to one cupfull add three cupfulls of boiling water and half a teaspoonful of salt. Cook for about an hour, or until soft or nearly so, when it can be put into a steamer and finished, or it may be placed in a slow oven to partly dry. Fruit, such as raisins, dates, etc., may be added as preferred.

* * *

FIG SANDWICHES.

Cut thin slices of whole wheat bread and butter them. Chop the figs or a mixture of dates and figs, moistening with a little fruit juice of almost any kind. Spread evenly upon the bread and cover with top slice, also buttered.

* * *

SEED CAKES.

Cream one cupful of sugar, with half a cupful of butter; add to this two beaten eggs, half a cupful of sour cream with half a level teaspoonful of soda dissolved in it; now add flour to make a stiff batter, one level teaspoon of baking powder, and half a cupful of flowered caraway seeds. Bake in one-loaf or patty pans.

* * *

FRUIT ROLLS.

Stir one tablespoonful each of butter and sugar and one tablespoonful of salt into one pint of scalded milk; when lukewarm add half a cake of yeast dissolved in one-fourth of a cupful of water and three cupfuls of flour, or enough to make a drop-batter. Let it rise until light, then stir in one-half cupful of butter creamed with one-half cupful of sugar, and add sufficient flour to make a stiff dough. Knead until smooth, and when light roll it out thin and cut into squares of about four inches. On the center of the dough lay half a canned peach, well drained, or four or five stewed prunes, or any preferred fruit which has been stewed and sweetened. Bring the corners up to the center, and press them together lightly, leaving spaces where the fruit shows. Lay them close together, and when risen again until light bake in a quick oven. —New Ideas.

SUGGESTIONS FOR SCHOOLROOM LUNCHES.

Below will be found several specific suggestions for the noon lunch.

LUNCH NO. 1.

Roast Beef Sandwiches.
Baked Apples.
Whole Wheat Bread.
Cup Custard. Seed Cake.
Ripe Peaches.

* * *

LUNCH NO. 2.

Roast Beef Sandwiches.
Baked Apples.
Small Rice Pudding.
Oatmeal Cookies. Cream Cheese.
Grapes.

* * *

LUNCH NO. 3.

Fig Sandwiches. Cracked Nuts.
Celery.
Sponge Cake. Currant Jelly.
Pears.

* * *

LUNCH NO. 4.

Cold Chicken. Buttered Biscuits.
Lettuce.
Comb Honey. Cream Cookies.
Peach Figs.

ASK AND IT SHALL BE GIVEN.

"Ethel, dear," said Bessie Brown, with proud eyes, "my brother, Philip Estes Brown, from South Africa."

Lieut. Phil bent over the dainty hand of his sister's chum, mentally contrasting her radiant fairness with the sun-burnt faces of the Boer ladies, his principal feminine society for two long years.

"I am pleased to meet you," he said, simply. "Bessie has often written of you. I can't express how glad I am to be shaking hands with a genuine English girl again after so many months of desolation."

"And I," said Miss Mackay, with charming seriousness, "am glad to meet one who has given up home and business to uphold his country's flag. My father fought for it in the Crimea. Besie told me," she continued, when the three had adjourned to the verandah, "that you received your wound in saving one of your men. Would—would you mind telling me about it."

"There isn't much to tell," said Phil, with an embarrassed laugh. "Bessie"—with a fond glance at his sister—"has constructed quite a romance out of it, with me for the principal character; but it was the other fellow who was the hero."

"We ran into an ambush about a dozen miles from camp—twenty of us; myself, the only officer, in command—and only by the greatest good fortune escaped annihilation. But we managed to reach cover with only half a dozen wounded.

"It was a sort of natural pocket in the rocks, a regular little citadel; but while the enemy couldn't rush out of it, we couldn't get out, either, for we were completely surrounded, and they numbered ten to our one.

"For two days we lay on those broiling rocks, hoping for the help which didn't come, till the heat and the want of water—for that had given out the first day—began to make the men go off their heads, and the suffering of the wounded made my heart ache.

"Things looked so black that I had about made up my mind to give up in the morning of the third day when one of the men—Rogers his name was, a splendid fellow—came up to me and saluted.

" 'Lieutenant,' he said, 'there's water out there about 200 yards to the left of us. I saw it as we were driven in. I can take half a dozen canteens, and when the moon goes down behind that cloud make a rush. If I get back we can last another day; if I don't—well, it's a man's death, that's all.'

"I wrung his hand impulsively. 'Spoken like a gentleman and a soldier,' I said, for I had long known he was a gentleman, though only a common Tommy Atkins.

"He reached the water safely, but half way back the Boers saw him as he crossed a patch of moonlight and fired; then he fell and lay still, and—and" continued the lieutenant lamely, "I went out and brought him in."

"He brought him in on his back," broke in Bessie, "with two bullets in his own shoulder. And what do you think, Ethel—the man's name wasn't Rogers at all, but Mackay."

Ethel had risen with staring eyes.

"What was he like, this man?" she whispered. "Was he tall and fair, and did he have a scar across his temple—so?"

"Why, yes,' said Phil, wondering at her agitation. "He was just like that—how did you—

"He was my brother, she cried. "He left home angry with father. I cant tell you why now; but father was in the wrong. He isn't dead—he will get well?"

"Oh, yes," said Phil; "he's all right, and there is a commission waiting for him when he gets out of the hospital."

"I must go at once and tell father," said Ethel, hurriedly. "Won't he be glad—and proud! But you," turning suddenly; "what can I say to you, who saved my brother's life?"

"Perhaps," he said audaciously, 'when I come back for always I may ask you for something. May I hope that—"

A sudden flood of red dyed the girl's pure face.

"Ask, and it shall be given thee," she quoted, softly.—New York Daily News.

The red rose says, "Be sweet,"
The lily says, "Be pure,"
The hardy brave chrysanthemum,
"Be patient and endure."

SHUN THE BOARDING-HOUSE.

Young man the time will soon come when you will seriously entertain thoughts of marriage. When the happy hour has arrived which makes you a married man, at once resolve that you will have a home of your own. Avoid a boarding-house, unless as a temporary abode. Boarding-house life encourages laziness, and wives who have no regular duties soon learn to gossip—at first to pass away the time—and afterward for pure love of scandal. The woman who indulges in this questionable pastime seems to forget that when she is absent from the meeting of the gossipers' club, that her character and habits will be discussed by her boarding-house friends, and certainly not to her credit, for scandalmongers always have something derogatory to say of the absent.

In a boarding-house there are no "home" attractions or duties, and the female occupants are forced to seek amusement elsewhere—some by constant visiting among such gadabouts as themselves, and others by shopping excursions, without the least intent of purchasing. The shoppers roam from store to store, examining the goods here and there, and causing the clerks useless and irritating trouble.

A young wife who has spent one year in a boarding-house has rendered herself unfit to preside over a home. She has become lazy, discontended, and has learned from her older associates a great deal concerning matters of which a good and true wife should be ignorant. Promiscuous association, such as prevails in the average boarding-house, should be avoided. It is very apt to seriously affect even the most conscientious of women, while to the young wife who lacks stability of character, it is likely to work an irreparable injury which leads to lifelong unhappiness.—L. A. in Housewife.

A little girl had sent back her plate for turkey two or three times and had been helped bountifully to all the good things. Finally she was observed looking rather disconsolately at the unfinished part of her dinner.

"What's the mater, Ethel?" asked Uncle John. "You look so mournful."

"That's just the matter," said Ethel. "I am mor'n full."

And then she wondered why everybody laughed.

THE CALIFORNIA GIRL.

The California girl already averages taller, heavier, stronger than her eastern sister, writes Charles F. Lummis in Good Housekeeping. Scientific measurements in California and eastern colleges a few years ago showed that the California undergraduate surpassed the New England girl of the same age in almost every measurement—with ten cubic inches more lung capacity, and a superiority in tested total strength (back, arms, legs and chest) of 716.2 to 493.7. But she has smaller feet and waist.

It would be strange if this were not so; and the disparity must increase as the type evolves and fixes. We shall presently have a new species of the genus girl—Puella California.

The California girl has a fairy godmother and her name is Nature. She has all seasons for her own, and no stepmother weather. The California girl can ride, drive, swim, walk, golf or picnic, any week in the year—any day, except the twenty or so when it rains. It is never dangerous nor uncomfortable out of doors; and she is out more than any other American girl. Quite as vital as this, she never has to breathe impure air, day or night. No wonder she builds a chest like Juno. And her amazement when she finds what people breathe in winter in the east is as great as her pity

Not only the climate but the scenery of her state help in the development of her, physically and mentally. There is no other land in the world with such a range and variety of outdoor nature of the noblest type.

Another advantage of the California girl is that she can—and generally does—eat more sanely. Fresh vegetables, fresh fruit, fresh fish, every day in the year. For oysters, every California month has an R; and these amiable bivalves are as good in summer as in winter. Strawberries every week in the year. All this makes for better digestion; and presently the California girl will have a stomach all her own.—San Jose Mercury.

BE HOPEFUL AND CHEERFUL.

But not least is the awakening and enthusiasm which comes from contact and acquaintance with those who have had trials like one's own, and by energy and perseverance have overcome difficulties which just now seem unsurmountable to ourselves. The writer knows whereof he speaks, having experienced nearly all the kinds of "luck" that comes to a farmer in a comparatively new country, and he can and does sympathize with those who may be wrestling with threatened misfortune and possibly despair. For all kinds of discouragement there is no one remedy that equals a cheerful disposition, and nothing tends to promote this spirit like activity, especially if something or somebody is made more comfortable or happier. If one is threatened with financial distress nothing will assure the creditor of the desire and ultimate ability to meet obligations like an active disposition and enthusiasm for one's business. Make the most of present opportunities. Discouragement of mind is apt to produce its effect upon the person, which in turn is reflected in the appearance of his stock, buildings, family and fields. Begin by making the family more comfortable than the stock. Tidy up around the premises and note how quickly increased self-respect appears, and with it credit and commendation from all. Let us begin the year by dealing justly with ourselves, our families, our animals, our land and all with whom we come in contact.—Farm and Home.

BUT IT DIDN'T SUIT HIM.

"Yes," said Mr. Wyncoop, heaving a sigh, "my wife is a delicious cook; and when we kept house and the hired girl's cooking didn't suit me she'd do it herself. I wish you could have a cup of her coffee. Why, in the whole two years we lived in Bunk street she never once set a poor cup of coffee before me. And her biscuits! Why, they were just like marrow.

"Some way I don't relish anything in the hotel where we are now. Now, tonight, for dinner, I ate a little soup, of course, and just tasted of the fish, with a litle tartar sauce and potatoes. Then we had roast lamb—I don't care much for roast lamb, but I thought I'd better eat some—and some French peas, and some potatoes roasted with the meat—I care more for them than I do for the meat itself. I didn't eat any of the tomatoes, they say they give you cancer. I did manage to eat the most of the broiled chicken, for I wasn't feeling very well and broiled chicken always agrees with me, especially if I eat watercresses with it; but I didn't touch a bit of the lobster salad, just turned my plate into Mrs. W's; she's very fond of it. I don't know as I ought to have eaten that lemon pie, but their pies are pretty good there and I ate two pieces; and a little wine jelly and some fruit and cheese. Mrs. Wyncoop isn't very much of a hand for ice cream, so I ate hers, and a few lady fingers. I didn't eat any of the nuts, though; just a few raisins, and drank a small cup of coffee; and here it's only ten o'clock and I don't feel as if I'd eaten anything in a week."—Household.

THE JOY OF LIFE.

Oh, the joy and the glory of life when we can get close to God. Not a flower, leaf or vine but embodies a sermon as eloquent as ever came from lips of man. Even the insects—though we find it difficult to believe it—each has its place in the great universal plan of creation. Even those which seem a pestilence are, after all, but messengers telling of disease germs somewhere, either in decaying animal or vegetable matter.

The great buzzing bumblebee carries the pollen of the clover so that the seeds that fall upon the earth again may have life to sprout and grow under the springtime rain.

And so things, even though we may not understand, have their purpose, and while we can find our lessons in even the brick and mortar of the city, it is out amid the trees and running brooks inhaling the pure, sweet air, hearing all the sweet melodies of woodsy cathedrals, the diapason of the storms that we come close to God.

And what are we each but a world in ourselves, with pestilential insects breeding in the miasma of our wrong doing; flowers blooming where our hands plant gentle deeds; sun a shining when we feel that we are doing our best and our efforts are prospering, storms beating and surging under affliction or disappointment. Each, as we move in our little orbit, have an influence over others.

But, as with the storms, even in the lowliest, most pitiful phases of life, still the "joy of life." The poor outcast upon Blackwell's Island, seamed and scarred with sin, holds to her breast the new soul embodied in flesh that another outcast has left motherless, and nourishes it from her own body, even though it must share with her own offspring at the maternal fount. Did poet or philosopher ever touch a more angelic strain? like a white lily arising from an ozzy bed of slime.

The most repulsive, bedraggled tramp has been seen to lift from the path, where it has stumbled, a little child, and restore to its chubby hand the pennies which had escaped from the baby fingers—pennies which would have bought for him a loaf of bread and the child some sweetmeats or a toy that it did not need. Surely it was the God within him that caused him to act and the innocent child recognized it beneath the filth and the rags and smiled up into his face and for that brief moment the "joy of life" dwelt in the heart of the tramp.

Surely there is no living creature so vile, so hardened but when the right hand touches the heart strings it can be attuned to melody. It may not be you, it may not be me, but some where there is a pure soul with a magnetic touch that could lead from the cell to the throne, the throne of honesty and godliness.

And higher up, at the very heights of fame of social honor of financial success, are hearts that ache, and eyes often dim, because they have passed beyond "the joy of life." They have in their haste to attain, strayed from nature's path and veiled their eyes to its lessons. Yet again, even there is often the sweet joy felt and guarded from the world; the joy of giving, of helping those who are trying hard to gain the heights. By educating the boys and girls who are dear to them, but without means; or those who are strangers but worthy; by endowing hospitals and homes.

The girl that protects the bird or the animal, that is thoughtful, helpful, unselfish and considerate, knows "the joy of life," and its sweetness will continually surround her.

The boy that is manly, strong without aggressiveness, honorable, obedient to his parents, grateful to them, trying to repay them by loving consideration, will be blessed with more than wealth.

The sweetheart who continually thinks how she can make herself a good wife in all that the word implies, fitting herself for housewifery and for motherhood; who allows no familiarities, even from the man she loves, but is like a pure, radiant star guiding his footsteps, knows the sweet "joy of life."

The husband and wife who each forgive and forget and allow no fretting discords in the music of home; who each assume cheerfully their separate burdens, will eventually become in truth as one.

Lastly, the one who must sit alone, with seeming bitterness and disappointment as a portion. It may be some man, or possibly some woman. Fortunately we cannot see beneath the seemingly placid or stern face, but even for them there is a joy of Hope, of unselfishness toward all, of making their very sorrows a joy and strength to those walking through the shadows who need a kindly hand to aid them up the steep path.

When weary and heartsick, fly to the fields, the trees and the sunshine and they will hush the wild tumult and you shall know all of "the joys of life." —Edith Hall.

FEMININE SIGNIFICANCE IN PERFUMES.

While few women realize it, yet in no way are their characteristics, traits, weaknesses and foibles displayed in a greater degree than in their choice of sweet odors. It is the exception when a girl or woman does not love a delicate perfume or use it in some way in her toilet. Some women always throw a few drops of some sweet scent into the water in which they bathe. Others have sachet bags sewed in all their dresses. Dainty notes from certain women betray their writer before opened by the delicate sweetness that they send out, while the old-fashioned housewife thought that her linen closet was not properly cared for if plenty of lavender was not scattered about, and the modern ones place odorous pads between the mattress and the lower sheets.

A voliet-scented atmosphere makes those who are surrounded by its influence religious, affectionate and peace-loving. Woman of lovable natures are always fond of violet.

Heliotrope generally finds devotees among the dainty, neat and rather unassuming disposition who dislike fuss or notoriety.

Rose perfume is most frequently used by warm-hearted, imaginative temperaments, who are inclined to extravagance and have a disregard of the more serious issues of life.

Lavender numbers its admirers among natures with high aims, and with a love of detail and exactitude. Eau de cologn is accepted by honorable and reasonable natures, having high aims and ambitions.

Lily of the Valley is used by women of imaginative temperaments, who are both affectionate and demonstrative, but obstinate to a fault.

Strong perfumes such as Jockey Club, opopanax, musk, single out their users as ambitious and strong willed, but of uncertain temper and mean spirited. A heavily perfumed atmosphere is eneravating and deteriorating. —Commercial-Appeal.

AUTUMN SONG.

Laugh out, laugh out, ye orchard lands,
With all your ripened store;
Such beauteous measure nature yields
How could heart ask for more?
Laugh out, laugh out, ye ripened fields,
With e'er increasing mirth;
The joy your bounteous measure yields
Shall bless the whole round earth.
—Successful Farming.

HAPPINESS OF THE FAMILY.

The happiness of a family is not dependent upon wealth, but it is more dependent upon the wife and the mother. She must be a home-maker—a womanly woman, but she must also be a home-keeper. The need of comfort, peace and happiness in an every day craving—and the old proverb about the dinner of herbs and the stalled ox is a true one.

What most of our sister housewives need is not to worry—to overcome the habit if possible—to study to have more recreation. My dear sister woman, if proivdence should take you from your loved ones, some one would be called to fill your place; so try and stay with your loved ones. It is said by a philosopher that good temper is characteristic of great mental power, for tolerance has its source in both the heart and the head.

A wife and mother who is delicate and nervous must recognize her want of strength and save herself all she can. I don't wish to preach a sermon, my dear sister housekeeper, but I wish to make your burden lighter. So many housewives rush through their duties day after day without any thought of trying to save themselves. Why should a busy, tired wife and mother stand and wash dishes when she could as easily sit down and have a restful cushion. Keep mops, plenty of nice tea towels, a little box of borax to put in the dishwater to cleanse quicker and to save your hands. If only you would strive to have every device for lightening your labors you could bring so much happiness and sunshine into the living room. The family are so much happier to have the dear mother present. Another hard duty is the sweeping daily of carpets. Try this plan: Sweep one by dipping a clean broom into a warm suds with two tablespoonfuls of borax in it. It allays the dust, disinfects and cleanses beautifully.—Sara A. Henton.

MAIL BY TELEPHONE.

Press dispatches state that when congress meets Senator Fairbanks will take up the matter of adopting rural telephones for farmers.

"Senator Fairbanks talks enthusiastically of the matter, says the report. He believes that the adoption of rural telephones will make it possible for the farmer to receive his mail as quickly as the man in town. He would have it arranged so that a postmaster could open a special delivery letter and read it over the telephone to the man in the country."

"Dare to be right, dare to be true,"
Never forget that's the thing you should do.
Keep the brave motto ever in sight,
For you'll never be left as long as you're right.

CHICKENS FOR ROSE BEETLE.

Editor Cultivator:—After reading the article in the Cultivator on the "Fuller's Rose Beetle" I am sure it is the pest we call in this section the Florida bulldog. Two years ago it was destroying, or at least seriously harming nearly everything in a large garden of roses and ornamental shrubs. I tried nearly everything, including tying cotton batting around the stems of plants, all to very little purpose.

At last I turned about two dozen hens loose in the garden for about two hours every day, hens that were kept penned up in the meantime, and now I do not think one rose beetle or bulldog can be found in the whole garden, or any trace of one. I let the hens loose every day and do yet, after irrigating they did their best work. To be sure they did some little damage, but nothing to speak of when the good they did is taken into account.—Wilbur Conover, Pacific Beach.

ORNAMENTING CITY STREETS.

Mr. Frank Lobingier, member of the City Council of Pomona, is seeking advice regarding tree planting in their city streets. Mr. Lobingier is very wise in stoutly urging that only one kind of tree be planted on both sides of a single street, and that variety be secured by changing as we go from one street to another. I believe Mr. Lobingier is right in the belief that this uniformity is so desirable that it would even pay to cut down the present trees and plant anew to secure it. Trees grow so rapidly in Southern California that the loss would soon be made good and then what a beautiful city we would have. February is a good month to set trees and any month in the year is a good time to clean up the weeds which so disfigure our streets at the present time. Weed cleaning is a work sadly needed in all sections of our state.

A San Francisco dispatch states that the State Board of Trade has instructed the manager of the board to inquire and report concerning the practicability of instituting a general inquiry into the fruit market, foreign and domestic, with reference to the ascertainment of all the facts relating to such market, and especially with reference to the amount obtained from such sales, to the end that the price paid to the fruit grower of this state shall more nearly correspond to the price at which the fruit reaches the consumer.

PROFITS IN BEEKEEPING.

This is a subject on which much may be said and written, both in favor of the industry and the reverse. Like the visionary profits in ginseng, the profits of beekeeping are often largely over-estimated. Like all legitimate industries, beekeeping should be, and can be, made profitable, but where one man makes a success of beekeeping more fail to derive profit therefrom.

This condition of things arises more from the prevailing ignorance of small apairists concerning the bees, their habits, peculiarities, and requirements than from any other cause.

There are men who have kept bees for years who will tell you that bees do not pay. Inquiry (if you do not already know the facts) will disclose what an intelligent beekeeper will immediately suspect, that such a man is ignorant concerning bees; that he really knows almost nothing about them.

One may learn to do other lines of work by observing how others do it, but successful beekeeping is rarely learned in this way. To be sure one may (and when possible this is a good way, too) work with a practical apiarist and learn his methods. This, however, few young men can be induced to do, and there is little to be gained by simple observation alone; so that, in later years when a man gains possession of a few colonies of bees, he is absolutely ignorant of their habits and requirements.

So true is it that lack of proper knowledge is the most universal cause of failure to secure profit from beekeeping that any intelligent person who is willing and able to devote sufficient time to the work may make a successful apiarist.

Let any man with an ordinarily good location, such as almost every farmer does have, pay a fair price for a few strong colonies, secure a standard work on apiculture, subscribe for a reliable bee journal, and proceed to study his literature and his bees together, and I will prophesy that that man will make an enthusiastic and a successful beekeeper

From such a small beginning, through such self-acquired knowledge, almost all our noted apiarists have developed.

One of our best authorities on this subject, the author of a universally recognized standard work, began his study with an absconding swarm of bees which he managed to capture. Every student of apiculture is now familiar with his name.

I remember when quite young a school mate coming to our house to secure my father's aid in finding a bee tree. The tree was found, cut, and the bees transferred to a hive. Now, less than twenty years later, that youth is an apiarist who owns, controls and manages many hundreds of colonies, located in various places. His income, though probably exaggerated, is said to be enormous. His father before him was not even a beekeeper. And so this man, without any previous knowledge, by means of such literature as all may obtain, has accomplished this wonderful result, alone and unaided.

While all cannot reach his heighth of success, nor even hope to, yet any who will apply his mind and devote his time to the work may be reasonably sure of a fair profit on the investment.

As to the exact amount of money one may expect to realize from any given number of colonies, I can not say. One year with another, we have realized in the neighborhood of $6.00 per colony set out in the spring, but in large apiaries I doubt if this could be averaged.

In fact, I believe this to be more than one would ordinarily be justified in expecting, at least without considerable experience in the work. Deducting from this the cost of hives, foundation, and packages leaves considerable less for profit. Yet there is a profit which pays well for the time and labor expended, if that time and labor can be spared from other farm duties. In this instance I am, or always have been, able to do the work in the apiary but it is not reasonable to expect housekeepers who have everything else to do to undertake so much extra work in addition.

Farm help is scarce, high, and often incompetent, so that if a man must hire extra help on the farm in order to work in the apiary it is doubtful if it will pay, unless he keeps a large number of colonies. No one man is physically able to do the general work of the farm and take care of an apiary besides, and do justice to both. So unless one is situated so that they can care for bees without employing extra help or intends to make apiculture an extensive business, it is not often advisable to keep bees at all, for, without intelligent care, they are seldom or never profitable.—Millie Honaker in Farmers' Sentinel.

VIEWS IN SONOMA COUNTY.

One of the richest sections of California is the bay counties north and west of San Francisco.

WELL TO KNOW.

A very good substitute for cream in coffee or to serve fresh on fruits may be made as follows: Beat the whites of two eggs very stiff, add a teaspoonful of sugar and one teaspoonful of corn starch; then gradually add a cupful of cold milk, beating steadily until all the milk is used. Heat a cupful of milk with a piece of butter the size of a hickory nut in it. When at the boiling point set it back on the stove, and pour in the egg mixture. Let simmer until the milk thickens to the consistency of ordinary cream. Strain through a fine seive, and allow to cool.—J. R. Mackintosh.

Sacramento will can 4,000,000 pounds of tomatoes this year.

GO TO GARDENA

Do you want a bargain? Do you want to make money and live in a beautiful farming district near street-car lines, 30 minutes from Los Angeles? Then "Go to Gardena," where there is taken an abundance of water from deep wells, ranging from 200 to 260 feet deep, and furnishing from 40 to 150 inches of water (per well) pouring forth an inexhaustible supply of pure soft water, both for irrigating and domestic use.

The soil is rich sandy loam, laying level and well adapted for irrigation. It produces the finest quality of alfalfa, berries and vegetables. The climate is ideal. There is a good class of people, churches, schools, etc.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 3 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

GRAY & NELSON
Gardena, Cal.

When we advertise we should try to impress upon the minds of the people that we have something good in store for them. We should so frame our advertising matter as to make it appeal to the individual as would a personal conversation. Literature is not considered advertising, but I think one cannot write too much about his business if he does so in an interesting manner. We should endeavor to say many things to our trade. If we can tell them how our business is managed, how the goods are bought, and how careful we are in deciding just what to buy, we are sure to interest the public. The more we talk about our business the more others will. It is our duty to start the ball rolling, and you may be sure the people will keep it going. Lots of people have nothing else to talk about but the stores where they do their buying. If we desire to be talked about in this way we must give the talkers something to think about first.—Boot and Shoe Recorder.

There are advertisers in the Cultivator who are acting on this basis. They educate and interest the readers in their wares persistently and constantly. It is true not only along the machinery line—not only are farm implements advertised, but the demand of the producing class for the better grade of clothing, boots and shoes, furniture and other wants are supplied on mail orders.

As the Agricultural Advertising says: "The farmer is a buyer of the progressive sort. The good clothes that suited him a year ago are not what he wants now. He is no longer content with salt pork for a ration. It's beefsteak, and he has ice and a refrigerator to keep it from spoiling until he is ready to have it cooked."

This fact is recognizzed by the London Clothing Co., of Los Angeles, who have for years sought and secured much of the best trade of Southern California by interesting the agricultural classes in the up-to-date clothing. That it has been a profit bringer is proved by the years of advertising which has been continued in the Cultivator. Their plan of dealing is indicated in their last week's ad. "Broad variety yet, and every one a bargain that will give us another clinch on your friendship."

* * *

The Blaney Shoe Co., of Los Angeles, is another seeker for Cultivator patrons. Mail orders are a specialty, but if in the city, get acquainted with Blaney. He is square in his deal, keeps good goods and the price is usually reasonable.

* * *

I. T. Martin also looks for and secures much outside of town trade. He sells furniture in large variety. Low priced and substantial also elaborate and in latest styles. Carpets and mattings may also be secured in all grades to suit the most fastidious.

* * *

One of the large and representative houses of Los Angeles which handles farm implements, wagons, carriages, etc., which has had years of testing as to its reliability is that of Hawley, King & Co. It has two large houses for showing the goods, the large retail house for the city trade at Fifth and Broadway and the wholesale implement house at Los Angeles and Requena. The firm handles the Deere manufactures, which have a reputation established the world over. Just now the most seasonable article is a fertilizer drill, for the season will soon be on for the application of fertilizers.

Long Beach has made a contract with the Standard Oil Company for 3000 barrels at 71 cents a barrel on board cars at Los Angeles. Oil is held to be better and cheaper than water.

The California Cultivator is expanding and it merits expansion. Its circulation is over 9000 and says it will celebrate the New Year with 10,000. —Pomona Times.

Alexander C. McAdie, director of the weather bureau writes up the conditions of crops and weather for the past week as follows:

The weather was slightly warmer in most sections than during the preceding week and generally clear until near the close of the week. Light rain extended from San Luis Obispo northward along the coast and in the Sacramento valley, but did not reach the central and southern San Joaquin valley nor Southern California.

Owing to the ample warnings to orchardists and vineyardists, there was no material damage to raisins and deciduous fruits on trays, and the clear warm weather following the rain was very beneficial. Late grapes on the vines, of which there is a considerable quantity in the Santa Clara and Sonoma valleys, were probably somewhat damaged, and there was some injury to beans and unprotected hay. Grape picking is progressing rapidly, and the shippers and wine makers are handling the crop expeditiously. The first crop of raisins is nearly all in the packing houses and the second crop is being dried. Prune drying is nearly completed. The almond crop is all gathered, and walnut harvest is in progress. Walnuts are of better quality than usual but the yield is light. Apple picking continues. Oranges are in excellent condition and are ripening rapidly in the Porterville and Oroville districts: a heavy crop is predicted.

It is reported that beans were not materially damaged by recent rains, but the crop is considerably lighter than expected in most sections, though of superior quality. Sugar beet harvest is nearly completed. Corn and potatoes are yielding good crops. Plowing and seeding are in progress in some sections.

In the San Jose valley, the weather was favorable for fruit drying and raisin making. Oranges continue in good condition and are coloring well; picking will probably commence about the 25th. Potato digging and corn picking are in progress, and some late alfalfa is being harvested.

In Southern California fruits are in excellent condition and will probably yield more than the average crops. Apples are nearly all gathered. Walnuts in Orange county are of better quality than usual, but the yield is below average; picking is in progress. Beans were not seriously damaged by recent rains except in a few places; in Ventura county the yield is better than expected, while in Santa Barbara county the crop is much lighter than two years ago, though of superior quality.

BEATS THEM ALL.

R. M. Teague, the San Dimas nurseryman, is most enthusiastic over this section of the state as a citrus center. "There is nothing in the south to come up to it," said he "Why there is nothing on earth that beats the young orchards of Boydston Bros. and Henderson and Winters. You could not make the people down south believe it. You have no scale to contend with, and think of the money saved in not having to spray or fumigate. It costs in the neighborhood of $100 or more a year to keep a fifteen year old orchard clean. The oranges are way ahead in ripening, too. Our oranges are not really ripe before January. Your oranges if they are not colored, are sweet inside. It is strange to me that land is held so cheap here. Land without water sells from $150 to $300 an acre down south, you can buy the same here from $30 to $100 an acre. I think nursery stock will sell at seventy-five cents f. o. b., that is good stock. I will have 100,000 good trees for sale. There will be in Tulare county about 50,000 nursery stock for the market."

The above, coming from a man with the experience that Mr. Teague has had, and who owns the largest citrus nursery in the state, is sufficient evidence to convince those seeking for a citrus investment, to come to Porterville and Tulare county.—Porterville Enterprise.

Los Angeles Markets.

LOS ANGELES, Oct. 15.

The produce market showed little change from last week's quotations. Vegetables remain at almost former quotations. Business has been active during the week and the demand for butter is steadily increasing. Spring chickens not as plentiful as last week but of a better quality.

The grain market shows little change.

Oil Cake Meal	1.75
Chicken Wheat	1.66
Cocoanut meal	1.50

San Francisco Markets.

Dairy.

SAN FRANCISCO, Oct. 14.—There has been a fairly steady market on butter during the week although on Wednesday a slight depreciation occurred. At the close of the day's trading prices ruled as follows:

BUTTER—Per lb:

Creamery, extras	28 @29
Creamery, good to fancy	25 @27
Dairy extras	24 @25
Dairy choice	22 @23
Store	18 @20
California Storage	24 @27
Eastern Creamery	23 @25

CHEESE—Per lb:

Cal. Creamery, mild new, extra	14 @15
Cal. Creamery, mild new, choice	13½@14
Young America	14 15½
Eastern, New York Cream, Cheddars and flats, new	14½@16

Eggs and Poultry.

The situation in the market for Ranch Eggs was without material change, offerings continuing very light and holders being able to secure any reasonble price they had a mind to ask. While quotations show an advance of a point some holders of selects demanded from ½c to 1½c in advance of the top quotation and secured it without difficulty. There was a lively trade in storage Eggs and the market was firm at quotations, with a strong upward tendency apparent.

EGGS—Per doz:

Ranch, selected, large	46 @47
Ranch, good to choice	41 @45
Store	Nominal
California Storage	27 @30
Eastern	23 @28

Fruits and Vegetables.

The general vegetable market remained about the same during the past few days with the exception of potatoes which show a decline.

APPLES—Per box, common to choice, 25@85c; fancy, $1@1.25; extra, $1.35@1.50.

PEACHES—Per box, 90c.

PEARS—Per box, Bartlett, $1@1.25; Winter Nellis, 75c@$1.25; other varieties, per box, 40@85c.

PRUNES—Per box or crate, nominal.

FIGS—Per box, $1.50@2.50.

CANTTLOPES—Per crate, 75c@$1.50.

NUTMEG MELONS—Per box, 35@75c.

WATERMELONS—Each, 5@15c.

TABLE GRAPES—Per small box, 25@50c; crate, 40@65c; Isabella, 50@65c; large box, 75@$1.25, as to variety; Wine Grapes, per ton, Zinfandel, $17@22; Mision, $15@18; White, $12@15.

POMEGRANATES—Per box, 50c@$2, as to size of box.

QUINCES—Per box, 40@60c.

BERRIES—Per chest: Strawberries, Longworth, $5@9; large varieties, $2@5; Raspberries, $4@6; Huckleberries, per lb., 8c; Cranberries, per bbl., Cape Cod, $9@9.50; Oregon, per box, $2.50@3.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal; Valencias, $$1.25@3; Lemons, $1@3; extra, $3.50. Grape Fruit, $1.75@2.25. Limes, $4@4.50.

VEGETABLES—Tomatoes, per box, 25@50c; Green Peppers, per box, Bell, 50@75c; Chile, 35@50c; String Beans, per lb., 2@3c; Wax, 2½@3½c; Lima, per lb., 3½@5c; Green Peas, per lb., 2½@3½c; Egg Plant, per box, 30@50c; Summer Squash, per box, 35@50c; Cucumbers, per box, 35@50c; Garlic, per lb., 3@4c; Okra, per box, 50@75c; Marrowfat Squash, per ton, $10@12.50.

ONIONS—Yellow, per ctl., 60@85c.

POTATOES—Per ctl: River Burbanks, 50@75c; Early Rose, nominal; Salinas Burbanks, $1.25@1.50; Oregon Burbanks, 75@85c; Sweet Potatoes, $1.35@1.40.

Dried Fruits, Nuts, Etc.

San Francisco Chronicle of the 14th says the market for Dried Fruits continues on a firm basis, but prices show no further improvement, although they rule strong for all descriptions. Apricots have been closely cleaned out of first hands and are strong at full figures. Pears are firm under light offerings, while Peaches are steady, stock being fairly liberal. Keen interest is still displayed in Prunes and large deals have been closed at full rates. Raisins are moving freely at the established rates. Nuts are in better demand and a 14c rate is expected to be the local jobbing price for new Walnuts upon their arrival. Chestnuts are more plentiful and slightly lower.

DRIE DFRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 5@6c; Sun Dried, 3½@4c.

Apricots—Royal, fancy, 9½@10c; choice, 8@8½c; Moorparks, choice, 10@12c.

Peaches—Choice, 5¼@6½c; fancy, 8½@9c. peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Black, 4@4½c.

NUTS—Per lb: California Almonds, hard shells, 8@8½c; soft shells, 8@8½c; soft shells, 10@11c; paper shells, 11@12c; standard, 9@9¾c; Pecans, 11@13c;Pinenuts, nominal; Peanuts, Eastern, 6@6½c; do, California, nominal; Brazil, 10@11c; Filbert, 10@11c; California Walnuts, soft shells, No. 1, 13½c; do, No. 2, 11c; hard shell No. 1, 13c; do, No. 2, 11c; Hickory, nominal;; Chestnut, California, 10@15c; Cocoanuts, $4.50@5 per hundred.

Live Stock.

Hogs were in increased supply and under a limited demand values for all grades showed a fractional decline. Prices for Calves were also off a fraction, as heavier offerings were available. Other kinds of Live Stock were as previously quoted, with a steady demand noted, especially for A1 lots, which easily brought full prices.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6½@7c; No. 1 Cows and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½@4c, gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb., live weight.

HOGS—Per lb: Hard grain fed, weighing alive 140 lbs. and over, 5½@5¾c; weighing under 130 lbs, 5¼@5½c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

FRESH MEATS.

Business in the market for Fresh Meats was purely of a routine character yesterday, but as supplies were not excessive the appearing prices were well sustained and first quality offerings sold well up to the maximum figures. Values for Mutton and Lamb show a fractional decline.

BEEF—Per lb: No. 1 Steers, 7@7¼c; do, second quality, 6½@6¾c; No. 1 heavy, 7@7¼c; thin, 6@6½c; No. 1 Cows and Heifers, 6@6½c; second quality, 5½@6c; thin, 4@5c.

VEAL—Per lb: Heavy, 6½@7c; light, 86c@9½c; poor Calves, 6@6½c.

MUTTON—Per lb: Light Wethers, 8@8½c; do, Ewes, 7½@8c; heavy Wethers, 8c; Ewes, 7@7½c.

SPRING LAMB—Per lb., 8½@9½c.

DRESSED HOGGS—Per lb., 8½c.

Retail quotations for Meats, as furnished by the San Francisco Retail Butchers' Protective Asociation, are as follows:

BEEF—Prime Roast, 15@18c; Porterhouse Steak, 18@22½c; Tenderloin Steak, 15@18c; Sirloin Steak, 12½@15c; Top Round Steak, 12½c; Beef Stew, 10c; Corned Beef, 8@10c, Soup Meat, 4@10c.

MUTTON—Leg, 15c; shoulder, 10@11c; Stew, 8@10c; Prime chops, 12½@20c.

SPRING LAMB—Chops, 25c; Hindquarter, $1.25@1.50;; Forequarter, $1@1.25.

PORK—Loin Roast, 15@18c; Leg Roast, 12½@14c; Shoulder Roast, 10@12½c; Chops, 15@18c.

VEAL—Loin Roast, 15@20c; Shoulder Roast, 12½@15c; Chops or Cutlets, 15@20c; Stew, 12½@15c.

These prices do not cover the cheapest grades, as it is impossible to quote regular prices on them.

Hay and Feed Stuffs.

HAL—Prices on Hay, per ton: Wheat, $13@$16.50; Wheat and Oat, $12.50@15.50; Oat, $11.50@14; Barley, $10@13; Clover, $9@10.50, Alfalfa, $9.50@12; Stock, $8.50@10.50.

STRAW—Good to choice, per bale, 50@65c.

FEED CORN MEAL—Choice grades, per ton, $31@32.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@29.

BRAN—Per ton, $22@23.

CRACKED CORN—Choice quality, per ton, $31 50@32.50.

OILMEAL CAKE—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BEANS—Prices per ctl: Large Whites, $2.50@2.75; small, do, $3.15@3.35; Pea, $3.25@3.50; Lima, $3.25@3.35; Red, $2.90@3; Pink, $2.40@2 70; Bayo, $2.50@2.75; Blackeyes, $2.65@2.75; Red Kidneys, $4.25.

Hops.

The price for new crop is 21@23c per lb, according to quality.

Wool.

Fall clip, per lb.: California, Plains, 8@10c; Foothills, 10@12c; Middle Country, 11@13c; San Joaquin Lambs', 9@11c; Northern Free 11@12c; do, Defective, 10@11c; Humboldt and Mendocino, 1214c; Nevada, 13@15c; Oregon, 17@19c.

Eastern Markets.

Grain and Produce.

CHICAGO, Oct. 14.—Favorable weather for the maturing of the corn crop in the corn belt had a tendency to make an easier and somewhat indifferent market for that cereal at the opening of the day's trading.

Wheat also showed an easier movement, December ⅛ to ¼ lower, at 79⅛@79¼. Trading was dull the early part of the session, and prices fluctuated within a narrow range. The tendency was toward a lower level, however, influenced by the small demand for cash and the lower prices in Minneapolis. Later, a fair rally occurred on buying by traders, who had sold short early, which sent December up gradually to 59½. Closing prices were near the bottom, with December ½c lower, at 78⅞, after touching 78¾@78⅞. The late weakness in wheat affected corn, and the close was only a trifle higher than yesterday. December being up ⅛, at 45¾, after selling between 45¼ and 45¾.

Grain Movements.

S. A. Fruit Exchange. Foothill Valencias, $2.90. Special $3.35.

As to raisins, prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b., at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb. box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.55; Two-crown London Layers, $1.45; Four-Crown Standard, loose, Muscatels, 7c per lb; do, Three-Crown, 6½c; do, Two-Crown, 6¼c; Seedless Muscatels, 5c; do, Seedless Muscatels, floated, 5¼c; Seedless Standard Sultanas, 5c; Thompson Seedless, standard, 6c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz. per lb., 7¾c; choice, 7½c; fancy, 12 oz., per pkg., 6⅜c; choice, 6¼c; bulk, per lb., fancy, 7½c; choice, 7¼c.

A handsome High School building of the Mission style of architecture is just being considered at Colton.

An electric car was recently run in Germany, as an experiment,, 125 miles an hour, with fourteen persons aboard.

At a late meeting of the grange at Healdsburg Congressman Bell's proposed Pure Wine Bill was endorsed.

The Moffat Bros., of Rialto, inform us they are about to double the capacity of their packing plant and reach out for business in territory not now exploited.

It is announced that the United States government will soon introduce into this country a Japanese salad-plant, called. Udo. The Udo is as crisp as celery and combines the taste of celery, lettuce and pineapple.

Mendocino county this year produced 7899 bales of hops, or 232 less than last year.

An enthusiastic citizen of Fresno makes the following claim: "Twenty-five years ago our town site was a sheep pasture. Now we have 10,000 inhabitants; a score of packing-houses, several fruit canneries and wineries. We have vineyards and olive groves, and orchards of figs, almonds, apricots, peach, pear, prune, orange, lemon, etc., etc. None of the famous fruit and vine districts of France or Spain are more worthy of a visit."

SUMMONS.

No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 14 day of Sept., A. D. 1903.

C. G. KEYES, Clerk.

(Seal) By C. O. Winters, Deputy Clerk.

SUMMONS.

No. 42415. Dept. No. 5.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the clerk of said Superior Court.

The People of the State of California send greeting to:

Mollie Estill, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for any other relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 19th day of Sept., A. D. 1903.

(Seal) C. G. KEYES, Clerk.

By C. O. Winters, Deputy Clerk.

Griffiths, Munson Briquette Co.

TELEPHONES { MAIN 806 / HOME 806

Office, 128 Hellman Blk. Works, Atlantic St. and Santa Fe Tracks

Los Angeles, California

Orchard Briquettes are in size 12 inches by 6 inches and 5 inches in thickness, weighing about 9 pounds each. They are to be burned in the orchard on the ground, requiring nothing to contain them, and being entirely consumed unless intentionally extinguished. Two or three are inclined towards each other, forming a pyramid, leaving free vent beneath for air passage, at which point the torch should be applied. No kindling is required. It will burn long enough to meet the requirements of the usual cold night. In orchards where some degree of protection is afforded by wind breaks or trees being large and close together, two Briquettes are used to the fire, twenty-five fires to the acre, one ton being sufficient to protect four acres for one night. In open and more exposed groves we suggest using three Briquettes to the fire or one ton to three acres for one night's fires. It is best to use the extra Briquette on the first two rows of fire on the exposed side of the grove.

Briquettes are impervious to water; and when placed in position where they are to be burned, if it should rain, the Briquettes shed the rain and are in condition to light at any time, and burn as freely as if not rained on. They should not be exposed to hot sun.

Price $12 a ton f. o. b. Los Angeles. Present freight rate same as coal. We hope to have a lower rate based on rate for fertilizers made, and are working for same.

SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

NO SMUT
SIMPLE AND EFFECTIVE

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees. I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is healthy, with fine flavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

Coulson's Egg Food

What It Is and What It Is Good For

It Makes Hens Lay Eggs When Eggs Are High

Times are getting so that the poultry business is like every other business. The man who doesn't understand his business will fail, and the poultryman who is not willing to learn how to make his hens lay will either fail or have a very poor living if he has to depend upon his hens to keep him. If one expects his hens

to lay well they should be fed well; that is, the right kind of feed, the feed that the hens can easily digest and turn into eggs. Every egg contains exactly the same kind of material, and the nearer we furnish the hen with exactly the right material in the right proportion and fix it so that it is easily digested, the more eggs the hens are likely to lay. Thousands of hens have little eggs of which only a few are laid because they do not have the proper food. Some things used in making Coulson's Balanced Ration Egg Food are: Best heavy oats ground into meal. These are then bolted over screens to get out as much of the hulls as possible (these hulls are sold for cow feed.) The fine oat meal makes the best kind of feed for eggs. Also use ground Chevalier barley, known as beardless barley. Also shorts and middlings, pea meal, cottonseed meal, pure flax seed meal, fresh raw ground bone, pure deodorized, dried beef blood ground fine, fine hen's teeth, granulated charred bone, powdered willow charcoal, and a little red pepper, ground ginger root, ground Foenugreek seed, iron tonic, etc. All weighed out in the right proportions and thoroughly mixed together ready to feed. All you have to do is to stir up with water and give a little green stuff of some kind.

This is a very rich mash food and it is only necessary to feed it once a day, either in the morning or at noon, and at night feed whole grain.

There is some fine grit mixed with this food to keep the hens from eating it too fast and to help digest it. This is certainly one of the very best rations for egg production and the cost is not much.

One of our customers has about 2400 hens. He feeds them twice a day only. One meal in the morning he gives them all they will eat of Coulson's egg food and at night he feeds them whole grain. 140 pounds of Coulson's Egg Food is all it takes to feed these 2400 hens. 140 pounds of this food costs about $2.75; so the cost is less than 15 cents a hundred to feed the hens all they can eat of it for one-half a day's rations. The egg production of this flock has increased an extra 300 dozen of eggs this month.

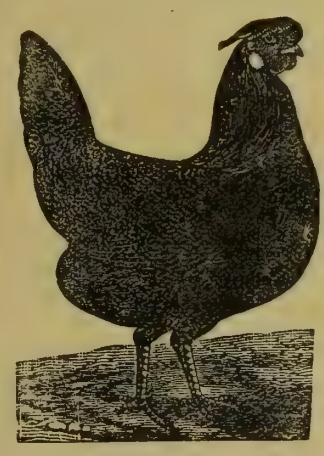
Another man has 600 hens and 100 pounds of this food lasts four days, and the hens have a full meal of it once a day. This man feeds three meals a day but for the one meal of Coulson's Egg Food the cost is less than nine cents for 100 fowls.

A hen cannot eat as much in weight of Coulson's Egg Food as she would of ordinary food, because Coulson's Egg Food is so rich and more substantial and so it is really cheaper than any other kind of food that you can feed.

And the hens will be healthier and produce more eggs during the year. Remember this feed is so rich that it

is only necessary to feed it as a mash once a day.

Nothing venture, nothing gain! Don't be afraid to try it. You have to buy some kind of food and a few cents more spent on a sack of good rich food



may make your hens lay a great many more eggs.

Now, when you start feeding this food, please stick to it for at least two months, and by that time you will be convinced that it is the best food for egg production. Many of our customers started feeding the food last fall and kept it up. Their hens laid well all winter, some hens averaging five eggs a week each. One flock of 200 hens laid from 8 to 10 dozen eggs a day. Another flock of 500 hens laid 200 eggs a day through the winter season.

Give the hens a little help if you want the hens to help you by laying lots of eggs, why not help them a little by giving them good, rich food like Coulson's Egg Food?

One meal a day of Coulson's Egg Food well be a great help to the hens because it will furnish them with a lot of good egg-making material.

You can produce eggs for 12 cents a dozen by feeding Coulson's Egg Food, and you can sell them for 45 cents a dozen. The more eggs the more money you will have.

A hen is simply a machine. Keep her in good order and feed her properly and she will make you a profit of more than a dollar a year for each hen properly managed. Better get a ton of this food right away and get the hens down to business.

A ton of this food will cost you $33, f. o. b. Petaluma, and it contains more egg-making material than forty dollars worth of cheap feed.

Cheaper to steady customers.

200 tons a month now being used.

The price of this food at Los Angeles is $2.25; in Santa Cruz is $2 a sack; Sacramento and San Jose, $1.85 a sack; Oakland, Santa Rosa and surrounding towns, $1.75 a sack; in Petaluma, 5 sack lots, $1.55 a sack. If you are living at a distance and your feed dealer hasn't got it, write to us and we will send it by freight.

Feed Coulson's Balanced Ration Egg Food and your hens will lay. It pays others to feed it! Commence now and fed the hens Coulson's Egg Food, 175 eggs a year from each hen. It beats all how it makes hens lay.

PICKING WATERMELONS EARLY IN JUNE AT COACHELLA.

COACHELLA WELLS—There are about 200 like this in the valley.

The Yeas and Nays of Citrus Culture

"Citrus Trees for the Million—a veritable sea of nursery trees in rows and going to intending planters everywhere."

1. A Plot of Citrus Trees on our Home Grounds. 2. A Daily Scene during the Shipping Season at San Dimas.

If you plant inferior trees, it makes little or no difference how fine your location is for citrus fruits; nor is it of much consequence if your soil is good and your water supply for irrigation ample, because badly-grown, weak and untrue-to-name nursery trees can never grow a profitable orchard, even under the most favorable conditions. An experience of upwards of twenty years in the growing of citrus trees exclusively has demonstrated this fact so forcibly that we never buy trees from other growers, but sell only what we actually grow and warrant to be the best that skill, superior soil and climate can produce. That this policy—though at times losing an order because we happen to be shy on certain varieties—is a winner is forcibly attested by the fact that the San Dimas Citrus Nurseries are now the largest growers of orange and lemon trees in the world. "Value for value, and the best is none too good for even the small planter," are two principles from which we never deviate."

We now supply many of the best planters in all sections of the world where citrus fruits are grown with their nursery trees, and stand ready to serve many more in the same way. Orders going to Italy, Australia, South Africa, Porto Rico, Cuba, Mexico, the Philippines and the home trade all give evidence of satisfaction with our trees and methods of business. In view of this fact, may we not supply your wants also? Our booklet on the "Yeas and Nays of Citrus Cultvre" tells all about growing an orchard and also how and why we do and get business. A copy is yours for the asking; write for it today.

Our Business is a Growing One and Yours Will Be if You Plant Trees Grown by Us.

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 17 LOS ANGELES, CAL., FRIDAY, OCTOBER 23, 1903 Subscription $1 a Year

THE COACHELLA VALLEY

In a recent issue, we gave a short article on the Imperial Valley. Of a trip through it by a number of newspaper men of Southern California. At the banquet at Imperial, tendered the pencil pushers, Irving H. Fay of Coachella spoke of the Indio-Coachella-Walters section as being the handle of the great "frying pan." This was with some hesitation, which implied apology, but the suggestion was so pat that it took all attending some little time to recover.

In fact there is one thing admirable in the residents of the "desert." They make no apology for the weather. There is no "exception, the like of which we never had before." When asked if it dosen't get awfully hot there, they say: "Yes sir, we have some nice growing' weather here. That's why we make money."

That money is made in both the Imperial and Coachella sections has ample proof. Corn, alfalfa, stock, raisins and melons. Melons is where the Coachella section is banking for reputation as a money maker. And when we speak of Coachella, the same condition prevails, largely, at Indio, Thermal and Walters.

This section is different from Imperial in this, that instead of the Colorado river furnishing the source of irrigation, the water is all secured from artesian wells. These wells vary from 400 to 600 feet deep, are sunk in 3 to 5 days at a cost of about one dollar per foot, and afford sufficient water to irrigate from 15 to 100 acres. The soil varies, some being quite sandy, others heavy loam, some 'dobe.

Both Mr. and Mrs. Fay of Coachella accompanied the excursionists on the round to Imperial and on the return, and stopped at Coachella, aiding the local committee in receiving the visitors. Breakfast was served at the hotel and a visit made to the office of "The Submarine," "the most low-down newspaper on earth," because it is published 76 feet below sea level. Notwithstanding, the undertow has carried the Submarine so far below the surface, it is a breezy little sheet.

The whole party was taken in carriages and wagons to the alfalfa fields, asparagus "patches," but in the melon fields, all we could do was to look at the dead vines and swap stories, as to how we skinned both shins clambing the old rail fence out of farmer Jones' melon patch, down in the corner of the corn field, 'way back in the states, in the '60s.

No, Coachella melons are the proverbial early bird. They catch the earliest market of any melon in the United States. Consequently, they are money getters. In June the work is on, and the eastern gardener is just nicely thawed out, ready for spring work, when California melons are in the market.

The acreage in cantaloupes in '03, was 240 acres, which yielded a total of 18,694 crates, or 50 carloads. Of these, twenty-four cars were snipped to Chicago, eleven to San Francisco, six to Los Angeles and others scattering.

Watermelons proved profitable the past year, but as a rule, the cantaloupe is expected to be the money bringer. The coming year's acreage is expected to largely exceed last year.

For properly packing or crating the melons, a large packing house has been erected at Coachella, and many are also packed on the ranches.

The ranches vary in size from 20 to 160 acres, but the greater number are from 20 to 40 acres. The returns may aggregate $250 per acre, though all will not reach that amount.

The method of packing is co-operative, much the same as the Southern California Fruit Exchange. The growers own their own packing houses, and the entire business is co-operative. That is, the business at the producers end. The marketing is as yet, done through commission houses.

But to return to our story of a ride. The melon fields were bare, and plans were being made for an early planting next year. One of these steps, is the sinking of new wells, which is now in operation. This is by the hydraulic method and is very rapidly done. Water under pressure is forced down through a two or three-inch pipe which, under great pressure, forces the loose loam soil up the outside of the pipe and when water is once struck, the well is cased. Some of these we passed were flowing large heads, while others in the upper part of the valley, required pumping. A number of most thrifty vineyards were passed, but as is the case with melons, the early table grape is the favorite. The Thompson Seedless is most frequently planted.

Sweet potatoes are the latest favorite we saw a few fields of them. The largest growers are the Goth Bros. The quantity grown per acre is large, and the quality is of the finest.

At the packing house, where the ladies of Coachella made a spread for the party, on its return, there were a number of exhibits of potatoes and other products. Better, they (the potatoes) were served at the table. The spread was richly enjoyed and a vote of appreciation tendered the ladies and people of Coachella.

One feature of the exhibit was a cottonwood tree, planted last March, as a cutting the size of a lead pencil and twelve inches long, which is now a large tree, over nineteen feet in height.

Coachella Melons
The returns from cantaloupes in 1902 were $55,000

Packing Cantaloupes

The Holstein-Friesian Association of America has empowered a special committee consisting of W. J. Gillett, Rosendale, Wis.; F. B. Fargo, Lake Mills, Wis.; M. E. Moore, Cameron, Mo.; W. B. Barney, Hampton, Ia.; H. B. Daggett, Lake Mills, Wis., and Robert Maguire, St. Louis, with authority concerning the association's special prizes on Holstein-Friesian cattle at the World's Fair. The committee has notified Chief Coburn that $1,472.50 has been set aside for this purpose, arranged with special attention to the encouragement of smaller breeders of Holstein-Friesian cattle to exhibit at St. Louis.

Tulare had a great time on Saturday last, the occasion arising from the burning of the San Joaquin Valley irrigating bonds. Governor Pardee, who made the address of the day, in the course of his remarks said: "I am glad to bear to you as the Chief Executive of this state the sympathy of the entire people of California in your hour of deliverance. As the smoke from the burning bonds goes soaring up into the blue dome that arises over us a whole state rejoices with you at the final extinguishment of the public debt your people so bravely shouldered, and so honorably repaid." This incident is but one of many which marks the growth and financial development of California.

Gradually a few good roads are being made in Southern California—but oh, so gradual. These are the crying need of the state. Without them we are poorly prepared to show our beautiful country to advantage. With them we will capture ten times what they cost in the wealth which they will attract in the tourists that settle in the state.

Strikes during the current year have cost eight of the leading cities of the country the enormous total of more than $42,000,000. Los Angeles, San Francisco and other California towns are largely represented in the loss estimate.

Forest fires are becoming too frequent for comfort of mind or property. The loss to parks alone in Los Angeles county will reach into thousands of dollars.

OUR TREATY WITH CHINA.

A treaty of very considerable importance has just been closed at Shanghai, known as the American-Chinese treaty, by the provisions of which our commercial business will be greatly enlarged. The treaty has received the imperial decree and only awaits ratification by the United States. The principal points of the treaty are briefly as follows:

First the settlement of the long-vexed question of internal taxation in China.

Second, recognition of Americans, right of residence throughout the empire for missionary work.

Third, protection of patents, trademarks and copyrights.

Fourth, mining rights.

Fifth, opening of new localities to international trade in the heart of the empire in which the United States has commercial interests.

Sixth, the right to carry on trade, industries and manufactures in all parts of China.

The negotiations which have been concluded will give this government almost an open door to trade with China, at least it will augment our commerce to such an extent as to add many millions to our export business. The cultivation of friendly relations with China is the immediate outcome of our position taken at the time of the Chinese war on its foreign population, and when the powers were only restrained from proceeding to dismember China and to apportion its territory, by the refusal of this government to join in the scheme.

Great satisfaction is expressed at Washington at the outcome of the negotiations for it makes certain that the two ports in Manchuria will be opened to the United States, no matter what the outcome as to the negotiations for the evacuation of that territory by Russia may be. The assurance that Russia had previously given, and to which this government would insist upon adherence, is that the treaty arrangements made with China covering Manchurian ports will be binding upon the Russian government.

Minister Conger is the recipient of most flattering congratulations by the authorities at Washington for the erudite manner in which he has accomplished this important work without exciting the opposition of competing powers. The direct benefit to California will come from its increased ocean traffic. Ports of entry along its coast will feel the stimulus of trade as commercial expansion is consummated.

TO DO AWAY WITH BOILERS.

Scientists and engineers are much interested in a recent invention by which the engineering world is to be revolutionized, and in future no boilers are to be used to generate steam. Instead, a steam generator will supply the steam.

The advantages claimed for the invention are that it is nonexploding and simple to operate. In instantaneous vaporization of water, whereby the fluid is flashed into steam, the generator has decided advantages over the present steam engines. In contrast with boilers, the invention does away with safety valves, steam gauges and water glasses. There is no storage of steam, as every ounce is used as fast as it is generated. Another advantage over the boiler is that Smith's device is compact and requires less than half the amount of space. A great saving in the amount of fuel is promised.

TRADE AND INDUSTRY.

The past few days have marked some fluctuation in the pulse of the commercial world. The failure of two or more banks on the Pacific Coast and the collapse of two Baltimore concerns, indicate that we are about to witness the liquidation of unsound trusts which have been promoted without a firm basis.

It may be expected that in the closing months of the year we shall witness the failure of more trusts, but it does not indicate an unsound financial condition for the country, nor does it portend a general crash. No sound institutions will be affected, nor will the general public suffer from this liquidation.

The Secretary of the Treasury reports the national banks as in good condition, and the state examiners make the same declaration as to state banks. The two banks which failed on this coast were really branches of the Mexican concern by whose collapse they were compelled to liquidate their business.

The only effect the flurry in the east will have on the country will be to make banks more cautious about making loans. Securities will be more carefully scrutinized and ventures in stocks will be curtailed.

So far as trade is concerned there is no diminuation in its volume. Our export demand keeps up a healthy output, and our merchants in trade centers report a splendid fall and winter call for staple goods.

The railroads are preparing for the greatest haul in the history of transportation business for the crops, in general, were never heavier nor have farmers witnessed greater prosperity.

In short, the country is all right. The people will not suffer from the failure of unsound institutions because the country is prosperous. The water will be squeezed out of the trusts and the holders of their stocks will be hurt, but these holders reside in the big cities and their loss will be personal; the public will not be the sufferer. Between the owners of trust bonds and stocks, it is a game of freeze out, and the survival of the fellow with the longest purse, but in this game of "dog eat dog" the people simply look on, and so long as they are not injured will take little interest in the fate of the stock gambler.

Trusts are extending to thieves in the smaller lines as well as to thieves in greater spheres. The latest is a housebreakers trust known as the Burglars' Aid Association, which has a regular code of signals and is said to be as thorough an organization for mutual protection as Morgan or Hill ever promoted.

The decision reached by the Alaska boundary commission is generally in favor of the American contention, with the exception of the one relating to the Portland canal. To Canadian commissioners refused to sign, but their action is valueless for the reason that a majority of the commission signed, which validates the finding.

One advantage in keeping the currant and gooseberry bushes well mulched, is that it lessens very materially the amount of cultivation necessary. A good mulch applied, with the soil in a good tilth, will keep down the weeds, keep the soil mellow, and aid materially in retaining moisture. About the best mulch to use in this instance is coal ashes.

STILL OMINOUS.

The war cloud hanging around the horison in the East does not present any brighter lining. Some days it appears as if the storm will blow over without serious damage, and then something comes up to change the aspect of things and it looks as if war between Russia and Japan would surely break out within a few days. So the scare has been on and off balance for the past ten days. One thing which statesmen think may change the entire status of affairs, is the attitude assumed by the United States as to the maintainance of its treaty rights in the territory coveted by Russia. That power will hardly cross purposes with this country, when by doing so it will break the friendship of many decades. Especially will it not do so when behind the protest of the American government stands plucky Japan ready to fight merely because she wants to whip Russia—and thinks she can. If the United States demands of Russia that she abandon her ambition to control Korea, war will be prevented. This government holds the key to the situation.

The President has issued a proclamation convening congress in extraordinary session November 9th, for the purpose of discussing the commercial convention between the United States and Cuba.

The Fresno district farmers' institutes, under the direction of the State University, will be held at West Park, November 5th; at Oleander the 6th, and at some point in the district not now designated on the 7th; W. R. McIntosh of the Valley Farmer, is pushing the work of arranging for the institutes, with much vigor. He will make these meetings a splendid success.

BY J. W. JEFFREY, LOS ANGELES

PHILOSOPHY OF CO-OPERATION.

The Cultivator will present in this article some points heretofore overlooked in co-operative circles, but of business interest to every one who wishes to see the mutual fruit-selling and kindred enterprises sustained. The experiences of the past summer, especially of the later part of it, advise us that unfair criticism may jeopardize even as great an institution as the California Fruit Agency, for such criticism may induce enough people to accept its tendency to overturn the plans of the great majority so carefully worked out for the good of all. As a basis for the following remarks it may be stated that the agency has been held to account for not selling fruit at a figure as high as that obtained in other years. The answer to this unfair attack has been the allegiance of 80 or 90 per cent of the coming citrus fruit crop, yet a few are standing out for reasons they are unable to explain or the co-operating sellers to understand.

It is a principle in commercial life that it is easier to buy than to sell. If Mr. Jones wishes to buy a sack of potatoes he knows who wants potatoes and usually knows where to get them. If Mr. Smith has a sack of potatoes to sell, he does not know who wants potatoes and consequently does not know where to offer them. The product can

be seen, but the purchaser may conceal his identity as long as acquisition of the product is not a necessity. It being a far less strenuous operation, then, to buy than to sell, we can easily see why most of the agricultural syndicates of the world are purchasing societies rather than selling organizations. It requires the highest art of co-operative societies to sell and the lowest art to buy. This is the reason the Southern California Fruit Exchange and its marketing successor, the California Fruit Agency, stand as the highest type of co-operation the world has ever seen. We might enumerate a few purchasing agencies to illustrate this claim. The French agricultural associations were organized for the purpose of co-operative buying; the splendid system of co-operative stores in England were formed because the retail dealers in the necessities of life had combined to nullify the natural laws of easy buying; our own co-operative stores are so easily sustained because purchasing groceries, for example, is an easy art and the co-operative customers of these stores have merely restored the practice of making their purchases to an economic basis. No great agricultural society has found any difficutly in purchasing its farm machinery, fertilizers and farm supplies generally from any one of a score of sources which the society might select and upon the most advantageous terms to each member. It is a curious fact that the co-operative marketing features of greatest European societies are so unimportant that they are seldom mentioned. The reason is obvious, and carries us back to the theme, "It is easier to buy than to sell."

Let us look at the other side of the proposition. It is difficult to sell. It is sometimes impossible to sell fruit, often problematic and always governed by circumstances not under control of the seller. The seller is sometimes confronted with a market absolutely without demand for his product at any price in wholesale quantities. His market is always contested and therefore problematical. The circumstances of perishable product, distance from production to consumptive point, weather conditions, governing preparation of fruit and the demand for it, the purchasing power of the consumer and many other points that figure between the seller and his market, render the contrast strong between the dependence of the selling agency and the independence of the purchasing power.

Another fact that makes selling difficult when dealing with perishable products is the difficulty of delivery in merchantable form. Acceptance lies so largely with the purchaser that a sale of citrus fruits is never sure till the money agreed to be paid is actually in hand. In a dead lock over the acceptance of a car load of fruit, the outcome between seller and buyer is usually not problematical. The agency controlling a carload of oranges has no interest for the time being in any other car, while the supposed customer may have negotiations under way for the ownership of a car of apples, a consignment of bananas, or an invoice of winter vegetables, any one of which he may make as profitable to himself as the purchase of the oranges. Any way we may turn the question the buyer has the advantage. There may often be a forced sale of oranges, but rarely a forced purchase; the purchaser needs no insurance against loss for he carries that in his personal application to his business; the selling agency must bear all the risks in behalf of its members, and they are so great perhaps no insurance association would underwrite them; it is easier to buy than to sell, as demonstrated in the purchase of box material, in which every purchase is an adavantageous one to the co-operative member; not so with the sale of each carload of oranges, for reasons given in the preceding paragraphs.

The let us sum it up in broad terms that the California Fruit Agency is the outgrowth of the best thought and most profound expérience found among citrus fruit growers; that its methods are calculated to dispose of fruit at actual selling cost, with the most perfect distribution posible; that it is founded on correct principles and has come to stay. Criticism should be withheld, at least, till some other plan of disposing of the outside 5 or 10 per cent of fruit is devised other than the commission dealing the outsiders have to depend upon in the disposition of their crops.

..General Agriculture..

FOREIGN CROP REPORT.

The following report upon the crops of various foreign countries has been compiled by the foreign statistical agent of the Department of Agriculture:

World's Grain Crops.—An estimate of the world's wheat crop has been made by the Paris Bulletin de Halles. In that estimate the total yield is set down at 1,021,200,000 hectoliters (2,897,859,000 bushels), as against 1,045,700,000 hectoliters (2,967,383,000 bushels) in 1902. This year's wheat crop is thus estimated to be less than that of 1902 by 24,500,000 hectoliters, or 69,524,000 bushels, a reduction of 2.34 per cent. The bulletin credits the exporting countries with a surplus of 175,600,000 hectoliters (498,300,000 bushels) and estimates the requirements of the importing countries at 169,400,000 hectoliters (477,869,000 bushels). The Bulletin's estimate would, therefore, give a net surplus of 7,200,000 hectoliters (20,431,000 bushels). These estimates are for the crop year extending from August 1, 1903, to July 31, 1904, inclusive.

THE SUGAR INDUSTRY.

The sugar campaign at the Oxnard factory is now practically half completed, says the Sun. Sugar is going forward at the rate of eight cars per day and every thing is moving along at a lively gait. While the crop is not coming up to the early estimates, the later beets are showing up much better than the early. This is thought to be due to the late heavy rains which packed the soil at a very inopportune time for the newly planted beets. Up to the present time something like 100,000 tons of raw beets have been received at the mill and their average percentage is up to that of previous years, and the belief of the factory officials who are in a position to know is that the sum total of the season's output will prove entirely satisfactory.

WHY NOT TRY SCUTELLISTA AS WELL.

The Upland News says:

"There is a strong movement in the district of the Ontario-Cucamonga Fruit Exchange (comprising Narod, Ontario, Upland and Cucamonga) to so thoroughly rid the citrus groves of black scale that there will be no necessity any longer of washing any of the fruit. The Exchange and its associations, as well as the growers themselves, are very anxious that this cleansing of the orchards should be attended to by everybody and made complete. By so doing it is believed that the fruit, as a whole, will bring more than enough additional money to the growers to pay for all spraying or fumigating charges."

Now after fumigation or spraying get a colony of scutellista and put on the trees. Then the work yill be complete for years.

TONS OF TOMATOES.

The Orange County Preserving Company is putting up over 10,000 cans of tomatoes daily, paying $6 a ton, the price fixed early in the season. This company is also loading one carload of dried fruit and four carloads of canned goods to ship east this week. Nearly the entire output of the product of the factory goes direct to the large eastern cities.—Riverside Press.

The California Raisin Growers' Association, has given notice to packers, by circular, that after October 15th no seedless raisins will be received for conformation at prevailing prices. The object of the resolution, it is thought, is to sell out a large block of goods, as was done last year. Of course, it is to the advantage of the packers to get in before the advance takes place, and that inducement is offered to make a clean up, as it is likewise to the advantage of the association to dispose of large blocks of goods. It is estimated that a little over a third of the crop has been delivered to date, and a good deal more money has been received by the directors than at the corresponding date last year.

NEW CURE FOR MILDEW.

G. H. Malter of the St. George vineyard has a preparation for the cure of mildew which will also resist sulphur. For the benefit of those who are troubled, he tells how to make and how to apply it. Preparation consists of 5 pounds of sulphate of copper dissolved in fifty gallons of water. In a separate vessel lime milk should be made, and added to the sulphate of copper solution until the blue color of the latter turns green. In this way the copper is neutralized and does no damage to the vines. The solution should be applied with a spray in such a way as to thoroughly cover the bark of the vine. If the mildew is of the variety known as "Anaheim," which can be told by its effects in causing one side of the leaf to sear and dry up, three gallons of crude carbolic acid should be added to every 100 gallons of the above preparation. The time for the application of the preparation is in the spring, after the vine blossoms and before it comes into leaf. Growers may find this receipt a useful thing to cut out and stick in their hats.—Fresno Democrat.

A NEW BLEACH FOR DRIED FRUIT.

Prof. G. E. Colby of the Department of Agricultural Chemistry, in the University of California, is reported to have discovered what he thinks is an instantaneous bleach for dried fruit in sodium peroxide. The German trade has been finding fault with our sulphured fruit, and so have other market countries. To avoid this complaint and to make fruit uniform in color Professor Colby has been experimentioning. The German trade has made the most serious objection to resulphuring which was necessary to produce uniform appearance, and the objection being urged by a country that receives so many goods, has caused the packing firms to seek the assistance of the University of California Agricultural Experiment Station in the search for a proper substitute, which would give the fruit the color that the trade asks for, without tainting it so that it is unmarketable. Professor Colby's experiments have been followed by a number of packing companies, and these and others interested will co-operate with him in completing the work and placing it on a practical basis.

Frank Dyerchuster, U. S. consul, Hungary, Sept. 17th, says: It is expected 15,432,200 pounds (70,000 quintals) of prunes will be exported in 1903, which is 130,000 quintals less than in 1902.

An insect known as the Dakota beetle is killing the pine trees around San Jacinto. Writing of the pest Mr. Bartlett says:

"The Dakota beetle is a winged insect of about twice the size of a common house fly, and is very prolific, laying thousands of minute eggs, which lie dormant for about one year, when each hatches, producing a small worm which begins upon its birth to feed upon the bark of the large tree, and does not cease until the large tree is killed. The larva, as the worm is called, returns then to its beetle state, flies to other trees, where it deposits its thousands of eggs, and in this way perpetuates its species, and continues to devastate the large forests."

C. A. Carpenter of Pasadena has devised a simple scheme to support tree limbs, which consists of small cuts of rubber hose attached by wire, and so arranged in the tree that one limb supports another, as the trunk supports the heavily loaded branches. The rubber hose is cut in pieces about three inches long then split lengthwise into two pieces, then the rounding side made the hollow side to press against the limb. The wire connection is then made of baling wire of the proper length for each branch. The device is simple, inexpensive and Mr. Carpenter says, keeps the limbs from breaking.

SUMMER IRRIGATION.

I would like to ask a few questions for information.

Do you think that summer irrigation, say after the middle of July, is good for walnuts? I was noticing that where they are irrigated late it starts a new growth and then nearly every winter it is frost bitten. I thought perhaps that might cause a die-back from the poison of the frosted limbs. I would like some opinions in regard to it.—Mrs. Adelaide Kelley, Anaheim, Cal.

Replying to the above question the best authorities agree that if walnut trees are kept well watered throughout the year there will be no new growth to be frost bitten in the winter, and that in addition to this advantage the trees will remain dormant later in the spring, thereby escaping some of the frost danger at that time. By keeping well watered it is meant that the land must be kept moist to the depth of at least five feet all the time, whether it takes only one, or as many as five irrigations in the year. The new growth which is frosted starts after the trees have become partially dormant from want of water and are then irrigated. This is also very likely to happen when the orchard is left without the July, August or September irrigation that it may need and early rains come with growing weather in November and December.

GRAFTED WALNUTS PREFERRED

Editor California Cultivator:—Could you please give any information with regard to walnuts, seedlings or grafted nuts. If you advise grafted which would you prefer, hardshell or black-walnut root? I wish to set out some this coming spring. I am a new-comer and some advise seedling, some black walnut root and others hardshell walnut root; and would like to have your opinion. In your issue of September 25th, there is a short article on the Maynard plum. Do you know where it can be purchased in California? I wrote to Fancher Creek Nurseries, but they did not have it.—Wm. Whitehead.

Grafted walnut trees are very much to be preferred over the ordinary seedlings inasmuch as each tree will be like all the other trees in the orchard. If a good bearing variety is planted, the whole orchard will be of good bearing trees instead of having as many as 5 or 10 per cent of shy bearers, as often happens in seedling orchards.

Walnuts grafted on soft shell roots are as good as any other, except for very light sons in which the native root seems to make the best growth.

WALNUT CROP IN CHILI.

R. E. Mansfield, U. S. consul, Valparaiso, Chili, under date of August 20th, writes: "The walnut crop this year is about equal to that of last season, in quantity, but the quality is reported not so good. Careful estimates place the total production this year at 50,000 sacks, averaging about 53 kilograms or 117 pounds to the sack 2,650,000 kilograms, or 5,800,000 pounds aggregate weight.

The market price in Valparaiso this season has averaged about 28 cents, Chili currency, per kilogram, or from $14.50 to $15 per sack of 53 kilograms. (The Chilean dollar is worth 36½ cents in U. S. gold).

The walnuts grown in Chili are known as the "English" walnut and are very similar to those grown in California.

ESTIMATE OF THE CROP.

The district exchange and its associations sent out postal cards some days ago for an estimate of the crop that is now on the trees, to all exchange growers at Narod, Ontario, Upland, Cucamonga and Etiwanda. About 60 per cent. of these cards have been filled out and returned. It is desired that those who have not made these estimates, as requested, should do so at once, in order that the total estimate may be made complete at an early date. This is extremely important in making plans for the marketing of the season's crop.—Upland News.

Land and Water

BY A. J. McCLATCHIE, PHOENIX, ARIZ.

EUCALYPTS FOR HOT, DRY REGIONS.

(Continued.)

Eucalyptus corynocalyx (Sugar Gum):—Close to the Red Gums discussed in the preceding article stands the Sugar Gum as a useful tree for hot, dry regions. It does not endure as much frost as the Red Gums, but endures much heat and drouth. It usually grows more rapidly than E. rostrata, and its trunks are more even in size and straighter. In may interior situations it makes as rapid a growth as the Blue Gum.

The principal use made of the Sugar Gum in the Southwest thus far has been as an avenue shade tree. While it has its value for this purpose, it is much more useful as a source of timber. Upon account of its quick growth and the even size of its trunks, it is especially adapted for growth for posts, for telegraph, trolley and telephone poles, and for railway ties. The timber is very durable underground. when cut into lumber it warps comparatively little in drying, becomes very hard, and is useful for a great variety of purposes for which hard wood is needed. In most dry interior situations it should be set in preference to the Blue Gum.

Eucalyptus crebra (Narrow-leafed Iron-bark):—The only one of the four valuable Australian Iron-barks that will endure well the conditions in hot interior valleys is E. crebra. This useful tree does well at Fresno and endures the frosts of winter and the heat of summer at Phoenix. It makes a slow growth under such trying conditions as exist at the latter place, but at Fresno it grows fairly rapidly, having straight, tall trunks and attractive foliage. The bark is rough, deeply furrowed, and hard and persistent, like that of other Iron-barks.

The timber is hard, tough and elastic, being useful therefore for a great variety of purposes. It is durable underground, and is consequently much used in Australia for posts, railway ties and piles, as well as for bridge material, for wagon-making, and for a great variety of other technic purposes. It is worthy of extensive planting for the above uses, as well as for its beauty and shade. The only present source of plants known to the writer is the Fancher Creek Nursery, Fresno.

* * *

Conclusion:—The species discussed in this article and the two preceding ones—namely, Eucalyptus rudis, E. polyanthema, E. rostrata, E. tereticornis, E. corynocalyx, and E. crebra—are the only ones that the writer feels warranted in recommending for warm interior regions. There are a few other promising species, but they have not yet been thoroughly tested, and there is at present no source of plants for setting for utilitarian purposes.

There are two other species that have been set quite extensively, and which endure interior conditions well, that cannot be recommended for general setting. One is E. leucoxylon, a tree that endures well the frosts and the heat of all hot, dry regions. where the writer has seen it tried. But the trunks are almost invariably crooked and out of the perpendicular, and the timber is inferior to most other species. In the catalogue of one of the Los Angeles seed houses this species is listed and described as the "Victorian Iron-bark," and the same error appeared in a Los Angeles Horticultural journal recently. It would be very unfortunate, indeed, if any one should be misled into planting this species instead of E. sideroxylon, the stately, useful Victorian or Red Iron-bark. The two are very different in every respect except their flowers and seed cases. The young seedling of E. leucoxylon have opposite broad leaves, and are much given to reclining and making a viny growth; while the seedlings of E. sideroxylon have alternate narrow leaves, and grow erect and shapely. The bark of the former is smooth and white, while that of the latter is very rough and dark colored. The wood of E. leucoxylon, as the name indicates, is white and comparatively soft; while that of E. Sideroxylon is dark-colored and hard as the name (meaning "iron-like wood") would indicate.

The other species referred to as desirable for general planting is E. viminalis. It has been planted quite extensively as a Red Gum, but is decidedly inferior to the true Red Gums. While its growth is rapid, wherever it can be grown, more valuable ones can be. It is useful principally for fuel, its timber not being strong, nor durable underground. Instead of this species, the Red Gums (E. rostrata and E. tereticornis) and the Sugar Gum should be set, since they will grow in all, or nearly all situations where E. viminalis will.

* * *

IDENTIFYING EUCALYPTS.

The secretary of the San Diego Park Improvement Committee sends Eucalypt twigs bearing leaves and seed cases, stating that they came from thirteen-year-old trees that had grown in the park on elevated land without irrigation during the past ten years, and desires to know the name of the species. It is evidently E. tereticornis, but more data are essential for a more definite determination. So frequently insufficient material is received for the identification of Eucalypts that it will be well to state what is needed in order to be able to make a positive determination of many species.

The material needed for the identification of a doubtful Eucalypt is: (1) the seedling or sucker growth, (2) a section of the bark, and (3) twigs bearing (a) leaves, (b) flower buds about ready to open, and (c) mature seed cases. The seedlings of the various species of Eucalypts each have their own characteristics, and are therefore very useful in identifying them. And since sprouts, or suckers that start out from the base, or where the trees are cut or injured in any way, are during their early stages like the seedlings, and should accompany the bark and twigs whenever practicable. Unopened flower-buds are more helpful in making a determination than are the flowers, and in some cases are essential for a positive identification. The more fully developed the seed cases are, the better.

YIELD OF ALFALFA HAY IN ARIZONA.

J. E. P., Beckwith, Calif., writes asking the "approximate tonnage of alfalfa hay grown in Arizona." The number of acres devoted to alfalfa in Arizona probably lies somewhere between 75,000 acres and 100,000 acres. Much of this is pastured most of the year, only one or two cuttings of hay being made annually. When devoted entirely to hay production, the yield is four to six tons per acre. During the winter alfalfa makes little growth, and is not cut for hay; and during the heat of summer the growth is so short that if not pastured off it is cut for seed only. Two or three cuttings in the spring and one in the fall is the usual crop from alfalfa fields here.

BERRY CULTURE.

Growing berries on a commercial scale is generally quite different from their culture for home use. Persons coming from the east must revise their ideas gained there by experience and this has lead a new subscriber to ask us to give an article on the subject.

The king of all berries is perhaps the strawberry. It is easy of culture in almost any situation but seems to do best on rather heavy soil. There is a difference of opinion as to the depth to which the soil should be plowed or spaded before planting. It is a rather shallow rooting plant compared with most fruits, but its roots penetrate deeper than its generally supposed. The advocates of shallow plowing hold that it is necessary in order to have solid subsoil that will carry the water rapidly from below to the surface where the main part of the strawberry roots are. Of course, a loose sub-soil, will not do this, but it has been our experience that after the first thorough irrigation the sub-soil becomes thoroughly packed and the water is very quickly brought to the surface. The problem has always been, "how to best stop such rapid evaporation?" Cultivation is usually practiced on large plantations, though we know of instances where water was plentiful and cheap, that it is turned on often as needed, without following up with the cultivator. This is objectionable, as the berries always lose some of their fine flavor immediately after irrigation. We much prefer deep and thorough plowing followed by a thorough soaking of the soil, after which cultivate, smooth and cultivate again before planting. Strawberry plants started thus, will do very well, and there will be no trouble in getting capillarity at work if the soil has in it any clay to speak of. Our light sandy soil will pass the water on up after such treatment.

Level planting on ridges are both practiced in all parts of California, the latter being the general way on the larger plantations. A ridge is thrown up by plowing towards what is to be the center of the double rows, two furrows on each side with a small plow being sufficient. A smoother is drawn lengthwise with the ridges, which settles them and evens up the ridges and furrows. An improvised sled with sloping sides which slant out at the bottom is a convenient tool for straightening up the sides of the ridges. If it is made about six feet long and turned upside down and drawn through the trenches, it will do the work quickly and accurately. The plants are set on the sides of the ridges, which should now be about two feet wide. Water should be turned in to settle the soil before planting as suggested above, and the plants should also be well soaked immediately after planting. If the land has considerable slope, cross ditches should be made at intervals so as to prevent washing from running the water the full length of the rows. The plants will get the water, as it soaks up on the ridges and as soon as possible after irrigation, the spaces between the ridges should be cultivated. If straw is plentiful, it may be placed between the ridges and thus mulch the surface that is wet at each irrigation. This will dispense with cultivation but unless the mulch is heavy, more irrigations will be necessary during the season than when cultivation is practiced. Straw that has been run through a cutter may be scattered on the ridges and on it the heavy bunches of fruit will rest, keeping them clean in case of a shower, which will render unsalable a large part of the crop.

The length of time between irrigations depends on the character of the soil, heavy soil retains the moisture much longer than light sandy soil. It is essential in growing first class berries, to keep the plants well supplied with moisture and they should never be allowed to suffer during the time they are out of fruit. Of course it should never happen at any time, as it is sure to injure their bearing capacity.

Level culture is often practiced when strawberries are grown between orchard trees. The same principles are followed in the preparation of the soil. When runners are allowed to take root and fill in the rows, the rows should be at least four feet apart to begin with. Cultivation after irrigation is the most practical way of keeping the moisture when level culture is adopted. Whichever way the planting is done, the irrigation water should never be allowed to run in among the plants. The soil near to them should be undisturbed if possible, as the roots come very close to the surface and besides it is difficult and expensive to work the soil directly beneath the spreading tops. After the fall crop of berries is harvested, it is a good plan to cut the tops of the plants off with a hand sickle and spray them with Bordeaux mixture. Then spread well rotted manure that has been well dried in the sun, over the entire plantation. The winter rains will leach the fertilizer out of the manure and good results will be seen in the next crop. Remember that the grubs which destroy so many strawberry plants generally get into the patch through manure that is put onto the land while still moist from the heap. Drying the manure will destroy the young grubs.

The favorite strawberries in Southern California are Brandywine, Lady Thompson and Arizona. Laxton's Noble is highly recommended by some growers, but it has not had the test that the above named varieties have had. Dollar is a berry that used to give us berries exery month in the year, both in the Sacramento valley and in Southern California. It never bears heavy crops but keeps at it. Another good quality is that it produces very few runners.

In producing new plants for new plantations, it has been found the finer fruit and stronger growing plants are obtained when the parent plants are not allowed to mature any fruit and only a limited number of sets. Cut off the end of the runners after the second set has formed. To follow this practice, it is necessary to reserve a part of the plantation for producing new plants. Only those plants that show a tendency to be prolific bearers should be used for the purpose.

Blackberries.—Abundant crops of luscious blackberries can be grown on almost any kind of land if they are given plenty of water. The land should be plowed deeply and well fertilized to give the best results and all subsequent cultivations must be shallow. If the roots, which come close to the surface are bruised or broken there will immediately spring up a cluster of shoots that will always interfere with the care of the plantation.

A plantation may be started by planting divisions of the root clump of old plants, or by roots that may be found anywhere in the patch. The best plants are secured from the divisions of crowns. When roots without the crowns are used. they may be cut into sections a few inches long and planted where the bushes are to grow. On ordinary land, the plants should be placed about four feet apart in the rows and the rows about six feet apart. In naturally rich moist land, eight feet apart each way is none too far. The best culture for a back yard or home garden, is a heavy mulch of manure, just enough hoeing to cut out the weeds, and an abundance of water.

After the bushes get up about four or five feet, the tops should be pinched off. If the plantation is a large one the topping may be done with a hand sickle. At the same time or when hoeing is done, before this time, the small shoots should be cut off. That will throw the growth into the large strong cane which will produce better fruit. The topping will prevent the bushes from getting top-heavy and cause them to throw out more lateral branches which increase the bearing surface. These laterals in turn should be tipped when they grow out a foot or two. Blackberry bushes so pruned will become stocky and hold up a big load of fruit without staking.

One of the best early varieties of blackberries is Crandall's Early, Erie is another, comes in later and is wonderfully productive. Kittatinny is a popular variety. Lawton is a late variety that will prolong the season if planted with the other named varieties. Evergreen is very much advertised but our experience prompts us to advise leaving it out of the home garden. It may do well in moist situations, but for a garden which requires much irrigation in a dry atmosphere, it will prove a failure. It is very thorny and the vine is such a rampant grower that it covers everything up within a rod of it and the berries are hardly worth picking. The thorns are so numerous and vicious that it is very disagreeable work gathering the fruit.

The Logan Berry has been the most popular berry of late years, but it is too acid for some persons, and no doubt its chief value is found in its canning and preserving qualities. For this, it is largely used and will grow in favor.

The vine is a very rank grower and must be allowed to train in a recumbent position to do its best. The fruit will not mature well if the vines are tied to a stake. The most approved method of training is to run the vines on wires or slats, two strings being necessary, the lowest about eighteen inches from the ground, the other 18 inches above that. As soon as the fruit is off, cut out the old canes and tie those which are growing, in their place. The same essentials in growing raspberry and blackberry bushes should be applied to the Logan Berry.

Cuthbert is the most popular red raspberry in this state. It does well in nearly all parts, is productive, of good color and fine flavor. Hansell is a good variety and has taken the place of Antwerp to a certain extent as an early sort. A succession of raspberries may be had by pinching the tops of a few canes after they have reached a few inches in height, when they will throw out laterals which will come into fruit later than those which make an undisturbed growth. By cutting out the canes as fast as they have finished fruiting, the vigor of the plants will be thrown into the canes that remain.

Fall planting gives the best results with berries.

FIELD PEAS

Germain Seed Co.,
Los Angeles, Cal.

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A. B. C. INSECTS.
(Continued.)

We are now to pay heed to the last of the bugs. In doing so we shall have finished the last of the species that undergo complete transformation. The Crustacea, the lobster group, change not a little in their development. The young crab is shrimp-like, the older one is like the lobster, while the mature form has the short tail and is the familiar crab. The Myriapods, like the lobster group, while they do not equal the insects in the transformations through which they pass, change not a little. At first they have fewer legs, and shorter bodies. The Arachnida or spider class all remain unchanged, if we except the order Acarina or mites, which we will remember have but six legs at first, while they have eight after the first moult. All of the insects up to this time if we except the sub-order Neuroptera of the lace-wings, pass through incomplete transformations. As suggested above, the remaining insects; the beetles, the two-winged flies, the moths and butterflies, and the bees and their allies all pass through complete metamorphoses; that is the larva like the caterpillar looks not at all like the butterfly that will come from it.

* * *

FAMILY ALEYRODIDAE.—White flies. These insects are rounded in form and carry a conspicuous fringe around their whole body. They are small and look much like scale insects. The mature insects, however, have wings in both sexes, and four wings, while only the male scale has wings and he only one pair. These are sucking insects of course, as are all the bug order, and though, like the scale insects, they are very small, on account of their enormous numbers, they may do immense damage. It is estimated that the white orange fly of Florida takes from the orange growers of that state the sum of three quarters of a million and some say a million of dollars annually. We are tremendously interested in these white flies as we are in eminent danger of importing these Florida pests. It has been in Florida for years and is spreading and the best informed despair of ever getting wholly rid of it. It also works havoc in several other gulf states. It is known as Aleyrodes citri and in the immature state looks much like our common soft brown scale. Some think that it is a native of Florida though very like it is an imported species, native perhaps of Chili, as Mr. Craw says he has known it to come more than once on fruit, which he has always destroyed, from that country. It is almost entirely without enemies, in Florida, and if imported into our citrus orchards, would become a terrible enemy. We must take every means to prevent this calamity. We must all become familiar with it so we can detect its first introduction. We must keep such a sharp lookout that we will see it as soon as it comes and then we must exterminate at any cost all of the intruders. Florida has a terrible enemy in this white fly of the orange, and we must keep it out at all hazards. It has spread pretty much over the citrus belt of Florida, and we must see that no such misfortune befalls us. Prof. H. A. Gossard of the Florida Experiment Station, Lake City, has in Bulletin 67, given a fine account of this insect and all of our citrus fruit growers should procure this bulletin and familiarize themselves with the entire life history, appearance and habits of this white fly.

* * *

ORCHARD VISITS.

Last Monday in company with Prof. Sumner and four other orange growers I again visited several orchards, that have been fumigated or sprayed under the supervision of the Horticultural Commission of San Bernardino county. We also visited and examined several other orchards that had been sprayed by other parties. We were, I think, of one accord in our conclusion, which we reached after this long examination. We examined one orchard in which the owner handled one of the nozzles, while the spraying was being done. As Mr. Pease, who was one of our party, remarked, the destruction was very complete, although we did find a very few live scale. Some of the other sprayed orchards, one the Jones orchard, which I mentioned in last week's Cultivator, showed that the work had been well done, though not so well but that we found a few live scale. This may be in part due to the fact that the spraying was done too early. We examined two orchards that were being sprayed at the time. One under the charge of the commission. In both we found many leaves untouched, showing that there was a lack of thoroughness in the work. In the one under the charge of the commission, where we would suppose as good outside help would be secured as possible, we found one bunch of leaves fully one foot in diameter, which was right on the outside of the tree, which had not been touched at all. This may have had one thousand young scale on it, which in case of no accident would mean one or two million scale next year. There is no question about the efficiency of spraying when thoroughly done. Last Friday, I examined two orchards near Claremont, which were sprayed some weeks ago. I examined quite carefully and found not a single live scale, though there were carcasses by the millions, Let me repeat, spraying can be made an entire success in the orange orchard, but only with the greatest caution. The sprayer should be young and active and should keep his mind on the work every second of the time. This latter is absolutely imperative. Commissioner Holbrook remarked with emphasis as a result of our examination last Monday that the owner of the orchard must be a party in the work of spraying. I have repeatedly urged this point, and more and more I believe it to be of exceeding importance. The dry leaves which I saw last Monday just after the trees were sprayed are most conclusive. Yet I have visited sprayers, taken unawares, more than once, and have looked entirely in vain for poor work.

We had evidence last Monday of the less cost of spraying over that of fumigation. This was in the orchard of Mrs. Jones of G. St., Ontario. The superintendent, a wide awake German, handled one of the nozzles. The work was well done, and the whole cost of spraying the ten acres was $46. Had it been fumigated by the county commissioners, it would have cost $140. It is safe to say that efficient spraying can be done at one-third or one-fourth the cost of fumigation if the latter is properly done.

The orchards fumigated about Ontario, under the direction of the Horticultural Commission show an excellence that cannot be too much praised. Orchard after orchard, examined showed not a living scale, and it was our unanimous opinion that no injury had been done the fruit except in one or two orchards, where, to complete the job, the work had been continued until after sunrise. Even in these orchards the percentage of damage is very light. This latter fact seems apparent as Mr. Rabe, who has certainly received much the most damage of any, was willing to settle for five dollars. Mr. Freeman who has charge of the other injured orchard, makes no complaint at all. Surely none of these gentlemen ought to complain but ought to be full of gratitude for the excellent work done in their orchards. I do not believe any of these orchards will have to be treated again for a period of three years. Mr. Pease, and, if there is any better authority on fumigation I have yet to see him, insists that enough cyanide be used so that the tender twigs at the tips of the branches shall be slightly burned. This not only insures efficient work, but is the safest guide that the right amount of cyanide and acid has been applied. I am free to say, that were the black scale to hatch as uniformly every year as they are hatching this year in the orchards about Claremont and Ontario, and I think this is is true of a much wider range, then fumigation would certainly be a wise practice, except in matter of expense. But when we can do as good work with the distillate spray at so much less expense, the conclusion still seems evident that spraying must soon supersede fumigation. I believe that very soon each neighborhood will have its own machine and each orchardist will either do the work himself or will so closely supervise it that it will be superexcellent.

We made a much more thorough examination of the King orchard than I was able to on the previous visit. We are all of the opinion that the injury in this orchard was primarily that of insects. Indeed we found almost exactly the same markings, which are very characteristic, in orchards which had been neither sprayed nor fumigated. This conclusion is sustained in the fact of the definite boundary of the injury. The limit of injury by fumigation is never obvious. The fact that the injured fruit is largely on the outside is not exceptional. Spotting by thrips and also by mites, I presume the same would be true of any insect, is always much more in evidence on the outer and upper part of the tree. Many of the spotted oranges in the King orchard could not have been touched by the tent. Mr. Pease remarked to me last spring that spotting by thrips was very much more apparent on the outer part of the tree. Others have noticed the same thing. The fact that the burning of the tender twigs in the King orchard is no greater than in nearly every other orchard that we visited, also argues that insects, not fumigation, have caused the spotting in the King orchard. It is possible, however, that fumigation may tend to deepen the insects' scar. I think we are all in accord with Prof. Sumner, who stated, as we came from the King orchard, that he was about to have a part of his own orchard fumigated, and if he could have just such a piece of work as that done in the King orchard, he would be entirely satisfied. Like every orchard which we examined, it is a magnificent piece of work, and the extermination of the scale is most complete.

It only remains to be said that spotting, or leaf dropping by distillate spray seems a matter of very little importance. If the orchards are in good thrift when the spraying is done, the right distillate used and the approved formula adopted, there will be no complaint of either leaf dropping or spotting of fruit.

* * *

SPOTTING OF FRUIT.

Until last year very little attention was paid to the spotting of our citrus fruits. True, in some sections, especially about San Diego, the work of the silver mite gave some anxiety. The great damage done last year by the thrips has led to more close attention in this direction. Now, all our more careful orchardists are watching for such disfigurement. Mr. Pease, one of our best observers, finds that this year there is a great deal of spotted fruit in the orchard. In his sharp quest for the cause he has discovered a new mite, which in some orchards exists by the millions. Oranges he sent me a few days ago contain hundreds of these little mites, which are even smaller than the common mite of the orange orchard. This new discovery of Mr. Pease has been named by Banks, our best authority in this line, Tenuipalpus californicus. It is to be feared we have another enemy to contend with in these very minute mites which make up for their size in their number. It is to be hoped that all our orchardists will be on the lookout for these and similar orchard enemies. There is hope in this close observation of our orchardists. It means that should the White Fly or Mexican Orange Maggot steal in upon us that they would be discovered and exterminated before they have fairly gained a foothold.

* * *

FARMERS' CLUB INSTITUTE.

Our readers will be interested to know that the Farmers' Clubs' Institute which is always an occasion of so much interest and importance, will occur at San Diego, December 2-4. Mrs. Sherman has promised to be with us and will talk on the Dairy Cow and the Vineyard. We have a partial promise that Mr. John Hamilton, Farmers' Institute expert, of the Department of Agriculture, will be with us and give us the benefit of his ripe experience and wide knowledge in Institute work. At the same time, to economize, we shall hold Institutes at Chino, Nov. 30, and at El Monte, Dec. 1. There will also be an institute at Clearwater on Friday, Nov. 27, and probably at Norwalk or Compton, on Saturday, November 28. We expect that Mrs. Sherman will be present at all these institutes and will give us the benefit of her wisdom and experience. We also hope that Prof. Baker, Mr. Maskew, and Mrs. Basley will each be present at some of them.

It is to be hoped that all our clubs will at once take measures to send each, a large delegation to the San Diego meeting. There are two good reasons why this should not be neglected. First, San Diego has always been very generous to come at large expense to attend all our meetings. It will be very ungenerous not to reciprocate in kind. Again, as always, this meeting will be one of exceeding interest and value. Every club should take measures to secure a personal report from one or more of its own members who will be present and so gain at first hand the information given at the meeting.

Free Books for Farmers

These books are compiled from the publications of the various Agricultural Experiment Stations, and are of great value to all practical farmers.

We mail them *free* to all farmers who apply for them.

The cold weather of the present season has destroyed the prospect of a large crop of grapes in France and therefore the wine output will be much decreased.

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

Farmers' Institutes will be held by Prof. D. T. Fowler, conductor for Central and Northern California as follows:

Pope Valley	20th and 21st.
Napa	23rd and 24th.
Two Rock	28th and 29th.
Geyserville	30th and 31st.
NOVEMBER.	
Newcastle	4th and 5th.
Loomis	6th and 7th.
Fresno	5th, 6th and 7th.
Potter Valley	10th and 11th.
Woodland	13th and 14th.
Anderson	18th and 19th.
Corning	20th and 21st.
Winters, probably	24th and 25th.

* * *

The sale of school books by the state in September amounted to $28,000.

The corn crop of the corn belt of the country is considered safe from injury by frosts.

It is estimated that wealth to the amount of $3,000,000,000 was added to the United States by the grain and fruit crops this year.

Governor Pardee has appointed Frank L. Caughley and T. L. Weedon directors of the forty-eighth agricultural district, Mendocino county.

Farm produce commands a good stiff price in San Francisco. Butter squares, 1 3-4 pounds, retail at 55 cents, and fresh eggs at 50 cents per dozen.

Up to this writing something more than 175,000 tons of raw beets have been received at the Oxnard sugar mills. Sugar is being shipped out at the rate of eight car loads a day. The sugar campaign is now about completed.

The contract for the erection of the California building at the St. Louis Fair has been let. It is to cost $15,000 and be completed February 15, 1904. It will be patterned after the old mission building of Santa Barbara.

Not many years ago there were many California farms containing from 10,000 to 40,000 acres. Those great ranches have been, or are being cut into small ranches and put into fruit, and it is found that fruit growers can make money on from five to forty acres.

The following are the chief officers of the State Grange, newly elected: H. C. Raap, Martine, Master; M. V. Griffith, Geyserville, Overseer; Dan'l. Flint, Sacramento, Treasurer; Mrs. L. S. Woodhams-Brasch, San Francisco, Secretary; J. D. Connel, Sacramento, Lecturer.

At the beginning of the season there was a cry that, owing to scarcity of farm help, the farmers of Central California would be unable to harvest their fruits. That foreboding was not justified. The shipments of fruits at this writing from Northern and Central California have been 110 car loads more than were shipped at even date last year.

Ventura county has long been famous as a bean county. It is destined to be known also as a sugar beet producer. This year six bean raisers, H. Hall, W. J. Heard, Frank McDivitt, M. H. Anderson, Mr. Rickart and the Horse and Cattle Company, tried beets. Their crop filled 165 cars. The beets are worth $4.75 a ton, or $25,000. The acreage planted was 285. Their returns were $88.00 per acre.

There are 72,452 farms in California, with an average size of 397 acres. The California Promotion committee has prepared the following table showing the size of the farms and what they produce.

	Total No. Farms.	Ave. Size. Acres.
Hay and Grain	19,048	533
Vegetbles	3,045	89
Fruits	18,537	96
Live Stock	15,418	812
Dairy Produce	8,686	274.8
Tobacco	1	640
Sugar	386	179
Flower Plants	208	8.3
Nursery Products	141	47.4
Miscellaneous	7,072	231.5

This classification of the products of farms does not exclude such products as are fed to live stock.

The Oregon crop of hops is being generally sold now at 25 cents.

The total yield of hops this year in Sonoma county, was 14,600 bales.

A movement is on foot to divide Siskiyou county into two counties.

Ninety-eight Filipino students left Manila October 10 for this country to enter American colleges.

The statement is now made that the steel trust had watered its stocks to the amount of $64,000,000.

Southern California, in the next legislature, will ask for a penitentiary in San Diego county, to cost $1,000,000.

The postal authorities have decided to substitute automobiles for horse carts in San Francisco, for gathering and distributing mail.

The use of crude oil on the roads has proven so satisfactory in many localities in Central California, its use is quite generally being resorted to.

The Pacific Redwood shingle company of Eureka, has cut the prices of shingles from $1.60 to $1.45. This is done to force smaller mills to join the lumber trust.

The ladies of Petaluma have organized an improvement club and are planning a campaign in which they will plant trees on each side of all residence streets.

Very interesting farmers institutes were held at Placerville and Marysville the 14th and 15th instant, and at Fair Oaks the 16th and 17th instant, conducted by Prof. Fowler.

The price of silver bullion still slowly advances. The director of the mint on the 12th instant, purchased 100,000 ounces at 60 1-8 cents per ounce. This is to be coined into Philippine money.

The three Eppinger Brothers, whose crooked dealing with the grain growers of the state have attracted so much attention, have been expelled from the Merchants' Association of San Francisco.

Judge Ross, of the Federal Court, has decided that the supervisors of any county cannot alter a state law which places a limit of twenty-five on the number of quail a sportsman may kill in one day.

Mrs. Daniel Gilger, of Healdsburg, informs the Cultivator that a solution of 14 parts of alcohol to one part carbolic acid is an infallible cure for those afflicted with poison oak. Apply the remedy to the afflicted parts two or three times a day.

Mrs. Russel Sage, Mrs. Grover Cleveland, Mrs. Theodore Roosevelt and other leading women, will hold a convention in December to discuss the servant girl question. They hope to create more humane treatment of servant girls by their employers, and thus induce more self-respecting young women to engage in that useful, and in no sense degrading occupation.

The Southern Pacific Company will oil 200 miles of roadbed in Arizona to keep down the dust. The experiment is satisfactory and other sections will be oiled.

The women of Marysville have organized an improvement club, and are preparing to plant out many hundreds of shade trees along the streets. There is a like movement in many towns of Central California.

On the 12th instant twenty-eight children and two adults were made violently ill at the county orphanage near Fresno by using bad milk. A force of doctors were busy all night with the patients. Fortunately no cases were fatal.

Several of the great railway and manufacturing companies are discharging large numbers of employes. Their excuse is that they are compelled to economize.

Immigration to this country is rapidly increasing. Recently 5000 a day passed through the gates of Ellis island.

Citizens of Tulare county brought suit for $14,000 due them for coyote scalps. The case has gone to the Supreme Court. The claims had been assigned to a bank that brought the suit. The lower court decided in favor of the bank.

Coast News and Notes

CONTINUED

Nearly 3000 people are now employed in the orchards and packing houses of the Pajaro valley.

Charles Gallettey, of Santa Clara county, has sold 10 tons of dried prunes to San Francisco parties at 2¼ cents.

The Sacramento Record asserts that all our best canned fruits are sent east and Californians eat the second grade.

The highest price received, this year, for a car of navel oranges from California, was $1,387.75. The fruit was sold in Boston.

The total shipment of fruits through Sacramento to the east on September 14th were 6717 cars as against 6590 to same date last year.

The Indian Bureau of Washington has awarded the contract to California bidders for the supply of dried fruits required by the bureau the coming year.

Hundreds of men and girls are now busy packing dried prunes at San Jose for shipment. Fifty to sixty car loads of dried fruit are sent out weekly for the east and for Europe.

The orange industry is growing to large proportions in Tulare county. The packing houses of Exter and other towns in that county are preparing to do a large orange shipping business.

Horticultural Commissioner D. W. Rohrback, of Monterey county, officially reports that a decided difference is noticeable in sprayed and unsprayed orchards in that county. In some instances the loss in unsprayed orchards is from 50 to 75 per cent.

The Pomona cannery, at this writing, has put up 800,000 cans of peaches and has been running on tomatoes more than a month. The tomato canning will last till November 1st.

Ten acres of land, near Mountain View, Santa Clara county, has been selected by the government as an experiment station, for grape vines. Sixty-four varieties of resistants will be experimented with.

W. F. Clark, at a recent farmers' institute, stated that it pays to spray for the coddling moth. From one unsprayed tree there were eight boxes of bellflower apples wormy—57 per cent of the whole yield of the tree,—while 16 boxes of perfect fruit were achieved by spraying.

Margaret and Lizzie McMurray, on one-quarter of an acre, planted to Phenomenal and Logan berries, realized a profit of $300 on a sale of fruit; and $144 from the sale of plants, and Miss Ida Shepard, of Fair Oaks, from a single acre of Phenomenal berries, realized $750.

The gathering of the Newtown Pippin apple will soon begin in Monterey county. The crop is good. Commissioner Rohrbrach estimates that the crop will amount to about 400,000 boxes. The prices range from 75 cents to $1.00 per box. In this county apricots proved to be only about half a crop.

Senator Perkins recently returned from Europe. He says California Peaches were selling when he left London at 40 cents. On the Rhine he found the vineyards not bearing one-fifth as well as here, and no wine he tasted was as good as California "Cresta Blanca." The high price of cotton has closed nearly all the textile mills, particularly in Manchester.

Now that winter is approaching the citrus fruit growers are again indulging in discussion as to best methods of protection against frost. One prominent grower says the only effective method is to warm the orchard by fires. It has been ascertained that crude oil smuts the fruit. A firm has, for frost preventative, begun the manufacture of briquettes made of crude oil sludge, coal screenings, asphaltum, sawdust and shavings. This, it is claimed, is impervious to rain and will not smut the fruit.

The supervisors of Tulare county offer a bounty of two cents for squirrel tails.

Yellow fever has broken out in Laredo, Texas, and has become an epidemic.

Beans were a little slow and the market slightly off owing to bear movements.

The U. S. government has let the contract for the big irrigation reservoir near Phoenix, Ariz.

New oil fields in Mexico of much promise are to be exploited by California capital this fall and winter.

The wool growers of Sutter and Yuba counties held a sale the 11th instant. Prices ran from 8 to 11¼ cents.

In the Berryessa valley black leg is killing many cattle, and the disease is spreading in spite of all efforts to stop it.

Four hundred and ninety-two locomotives on the Southern Pacific system now use oil instead of wood or coal for fuel.

Owing to the injury to cotton by the weevil in Texas, hundreds of cotton growers are moving to Oklahoma and the Indian Territory.

Australia has the largest duck farms and the largest incubator in the world. The incubator has a capacity of 11,440 ducks' eggs and 14,080 hens' eggs.

Four gas wells near Ventura give forth a flow of 25,000 feet per day of excellent gas. Ventura and Oxnard are to be supplied with natural gas for fuel purposes.

A movement is on foot to ask congress to amend the Inter-state Commerce law giving power to fix rates on railroads after a full hearing of grievances of shippers.

The famous trotters, Lou Dillon and Major Delmar, were pitted against each other at Lexington, Kentucky, the 10th inst. The first made a mile in 2:01¾ and the latter in 2:03¾.

W. H. Blaine, of Tulare county, will next week, bring 200 head of cattle from the mountain range and put them with his 180 other head on his Monson ranch. Mr. Blaine raises some of the finest cattle found in the state.

The fourth annual meeting of the California Game and Fish Protective Association will be held at Paso Robles on November 13th and 14th. A barbecue and quail and wild pigeon shooting will be features of the entertainment to be provided for the visitors.

The Central California Beekeepers' Association held a convention at Bakersfield on the 13th instant. A telegram from the Los Angeles association was read stating that the directors had fixed a price of five cents a pound on light amber extracted honey, to hold good for the next thirty days.

The regular prizes offered by the Louisiana Purchase Exposition to Holstein-Friesian exhibitors amount to $3,995. The World's Fair special and regular prizes for Holstein-Friesian cattle are about $1000 more than double the offerings on the same breed at the World's Columbian Exposition in 1893.

W. S. Melick, Secretary of the State Board of Examiners, says: "Within six months the government will begin a system of irrigation in California that will cost over two million dollars and place under irrigation 250,00 acres of arid land. Clear lake is to be tapped and waters distributed.

The general government has commenced an extensive system of irrigation in Nevada, Wyoming, Colorado, Montana, Arizona and California. In this state there will be three distinct systems: First, to distribute the waters of the Colorado river; second, utilizing the waters of Clear Lake; third, the uniting of the several systems of Kings river under government management. Over one million acres of arid land will be irrigated under the three systems.

VETERINARY DEPARTMENT

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

INDIGESTION.

Editor Cultivator: Can you, through the Cultivator, give me advice regarding treatment of a horse? Some time ago I doctored a horse for worms and he apparently got rid of them. Soon after he had a very bad attack of scouring and got very thin in a few days. I stopped that with rice milk and laudanum and since have been feeding him wheat hay, rolled barley and bran and have given him flaxseed and milk. The day after giving him the rice milk I noticed in the stable considerable gravel he had passed, which he must have got in picking up stray wisps of hay in the corral. He has been liable to slight attacks of scouring, especially when idle for any length of time and when fed on barley hay, though with wheat hay and plenty of work he has always been all right. After the scouring stopped he picked up very fast to a certain point and past that I can't get him to fatten. If you will put me on the right track I shall be greatly obliged.—A. T. F., Glendora.

Take of sulphate of iron and nux vomica each 2 ounces and cinchonae, gentian and ginger each 4 ounces; mix and put one tablespoonful in the feed three times a day.

* * *

DILATED BURSAE.

Editor Cultivator: I have a colt 5 months old which sprained its ankle or fetlock joint of hind foot by jumping over a barb wire about one month ago. It is no longer lame but there is quite an enlargement of the tendons or muscles on the fore side of the leg over and above the joint. Does it need treatment? If so, what?—F. E. Lowe.

The sack containing synovia that assists the passage of the interior extensor tendons over the fetlock joint became stretched and filled with the oily synovia. They are hard to remove without an operation. You might try painting it with tincture of iodine once a day.

The American Association of traveling passenger agents will convene at New Orleans the first week in November. If the members of that mustrious body would only devise some scheme to compel the baggagemen, who handle the trunks of the traveling public, to dispose of them without wrecking them. This is one of the burning questions which the tourist of today earnestly desires to see satisfactorily answered.

Well Drilling

Wells drilled in first-class manner from six inches diameter to any size desired. Pumps installed.

W. D. Anderson
381 D ST. AN BERNARDINO, CAL.

HORSES FOR SALE.

MILK ROUTE FOR SALE

Owing to my wife's failing health I am compelled to offer for sale my

Milk Route, 10½ Acre Dairy Ranch and 33 Head Well-Bred Dairy Stock

Here is an opportunity for some energetic man to step into a well-established business that will comfortably support him from the moment he takes hold of it. Escondido is one of Southern California's most thrifty, healthful and charmingly located settlements, and this is its only milk route. My books are open to the inspection of bona fide prospective purchasers.

C. A. STAMMER,
P.O. Box 1, Escondido, San Diego Co., Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

FEEDING AND BREEDING JERSEYS.

Please give me some information on feeding good young Jersey milk cows for best results in milk production, with feed available at prices named:

Wheat bran, $20 per ton.

Cotton seed meal, $24 per ton.

Cotton seed hulls, $5 per ton.

Sorghum hay, $6 per ton, with fair pasturage (native timber grass). Do you recommend breeding Jersey heifers young? At what age?—O. P. Nagle, Yoakum, Texas.

Ans.—Referring to yours of the 3rd instant, I am pleased to advise that you use the following ration for your Jersey herd, while running on the native grass described. Five pounds of cotton seed meal, two pounds of wheat bran, ten pounds of sorghum hay and ten pounds of cotton seed hulls per day. When the pasture fails, would advise that you substitute two to four pounds of corn chops daily for the grass, to sustain the flesh of the herd.

Well grown heifers may be profitably bred at 18 months old. Small or undersized heifers should not be bred for two or three months later. The season at which the heifer will drop is a factor to be considered. The spring season is the most favorable time for very young heifers. Full feeding in the late winter with silage or green alfalfa may supply all the protective conditions wanted. One reason that Jerseys are so small when matured is because of too early breeding.—Farm and Ranch.

MAGNITUDE OF WORLD'S FAIR PRIZES.

The cash prizes in Chief Coburn's department of the World's Fair are $55,300 greater than those offered by the fourteen largest live stock shows of the United States in 1902.

This interesting comparison was made at the recent meeting of the American Association of Live Stock Herd Book Secretaries in a paper on "Live Stock Exhibits at the World's Fair," read by Hon. Geo. W. Stubblefield. Mr. Stubblefield took for comparison the amounts of money offered in 1902 by the State Fairs of Illinois, Indiana, Iowa, Kentucky, Michigan, Minnesota, Missouri, Nebraska, New York, Ohio, Texas and Wisconsin, and of the International Exposition at Chicago and the American Royal show at Kansas City. The total live stock offerings of these fourteen great shows, compared with those of the World's Fair at St. Louis, read as follows:

	State Fair.	World's Fair.	Difference.
Horses	$49,488.00	$93,640	$44,152.00
Cattle.	84,623.50	64,030	20,593.50
Sheep .	23,906.50	45,500	21,593.50
Swine .	24,477.00	32.186	7,709.90
Poultry and Pige'ns	13,329.85	15,770	2,440.15
Totals	$195,824.85	$251,126	$55,301.15

These figures give at a glance a view of the magnitude of the World's Fair live stock prizes.

EXERCISE FOR MILCH COWS.

Every dairyman knows that violent exercise is detrimental to the yield of milk, but it is an error to suppose that continued confinement in the stall is the most economical treatment for a milch cow. Close confinement, with impure air and lack of exercise, is as prejudicial to the health of cows as to that of human beings. With moderate locomotive exercise the slight reduction in quantity of milk appears to be fully compensated by the increased yield of solids. Munk undertook to settle this point, and experimented with thirty cows and found that when they were allowed half an hour daily exercise the total quantity of milk, as well as the fat and casein, increased though much exercise exerted an adverse influence on the milk. When cows are on grass their increased appetites in the presence of an abundance of food quite makes up for any loss incurred in the movement necessary to obtain that food. Hence it is desirable that stall-fed milch cows should have daily exercise. Very violent exercise sometimes has the effect of producing very much change in the quality as well as the quantity. It always has the effect of lessening the quantity but the effect upon the chemical composition is not known. There are numerous instances, however, in which the physiological effect of taking milk from an exhausted animal has proven injurious. It is generally recognized that it is unsafe to allow a calf or colt to suckle when the dam is overheated.

On August 19, 1891, at Bourbon, Ind., the following case occurred: A valuable mare owned by Mrs. C., had been used at the harrow while her six weeks' old colt had been left in the shade. The mare fretted greatly and was worked a couple of hours longer than usual to finish a piece of work. The foal was allowed to suckle as soon as she stopped work. It died in in about four hours. No cause could be assigned except the possibility of the milk having become altered by fretting, heat and exertion.

Recently promulgated theories of dark, warm stables and no exercise for profitable milk production are without rational basis and lead to disastrous results sooner or later. Attached to the cowhouse should be an exercise yard, a part of which should be roofed.

Very young grass or alfalfa is a laxative food, and if cows are turned on it in the early spring and allowed to eat their full, they are pretty sure to fall off much in milk. The cows should be allowed to feed gradually on new grass in the spring, and for a short period at a time, until they gradually become accustomed to the new diet.

Are you selling your milk in town? If so, it will pay you to keep every thing about your dairy and barn neat and clean; then if your customers drive out to see your place they will be pleased instead of going to find another dairyman.

THE ALDERNEY BREED.

"The Alderneys and Jerseys are so closely related and so much alike in appearance that the description given for Jerseys will apply to them. They can be classed as the same breed, but bearing the name of their island home. The main difference is that the Alderneys are smaller and more delicate, and for this reason are not so much in favor."

The above passage was printed in a book which I judge is in the hands of many farmers throughout the country.

When Channel island cattle were first imported to the United States, and for a long time thereafter, both Jersey and Guernsey, and especially the former were called by many people Alderney cattle. The Island of Alderney is one of the Channel group, and although the third in size is too small to export any cattle. It probably has no cattle except for family use, and so far as record shows none were ever exported from there. The name may have originated from the fact that Alderney, having a good harbor and being nearer to England, all vessels carrying cattle or produce from Guernsey and Jersey formerly cleared from the Alderney port before leaving the islands for England. This may have given the impression to early English importers that they were Alderney cattle, and the name so came to this country. The fact is that there is no such thing as an Alderney breed of cattle.—Breeders' Gazette.

Don't forget that your cows need salt. Keep it where they can get at it every day of the year.

WILL HOLD THEIR CATTLE.

William Herman, a Wyoming rancher shipping from Grenza is of the opinion that there will be a great many cattle held on the western range this winter unless prices advance before the shipping season is over. He brought in a bunch of cattle and says that he only shipped the poor stuff, off colored, etc. He says he won't sell his best stock at present prices and is making preparations for the winter accordingly. There is plenty of hay in that part of the country, and Mr. Herman thinks that practically all who can will take a chance on next season. The grasshoppers have done some damage to the ranges on the divides, but have not worked on the alfalfa in the valleys. People in that section figure on feeding about a month and a half or two months. They fence off pastures for fall use and the grass in them is now maturing into good substantial feed.—Omaha Stockman.

GO TO GARDENA

Do you want a bargain? Do you want to make money and live in a beautiful farming district near street-car lines, 30 minutes from Los Angeles? Then "Go to Gardena," where there is taken an abundance of water from deep wells, ranging from 200 to 260 feet deep, and furnishing from 40 to 150 inches of water (per well) pouring forth an inexhaustible supply of pure soft water, both for irrigating and domestic use.

The soil is rich sandy loam, laying level and well adapted for irrigation. It produces the finest quality of alfalfa, berries and vegetables. The climate is ideal. There is a good class of people, churches, schools, etc.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 3 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

Gardena, Cal.

Does Fancy Butter Pay?

Samuel Haughdahl, the noted creamery authority, writing in the Dairy World, says:

We often hear the assertion made that it does not pay to make a fancy article of butter, that creameries receiving hand separator cream or making an inferior grade of butter get the same price for their butter as creameries receiving whole milk and ripening their cream by the use of a commercial starter and using up-to-date methods. While this may possibly be true in some exceptional cases, such statements are as a whole erroneous and misleading and tend to foster the belief that the quality of butter is a secondary matter after all, if the same price is paid regardless of quality.

I have known of creamery boards to hold meetings and quarrel for days if they should buy a new vat or buy a starter can or a milk heater or grant the butter maker's demand for a raise of $10 per month and finally conclude that it would not pay to spend the money, and at the same time also conclude that one-half cent premium was good enough. In other words, they would rather be satisfied to lose from $500 to $800 per year in the price of their butter than to pay their buttermaker what they believed to be unduly high wages or investing $100 for improving the equipment of the creamery. I am glad to say that this is not always the case, but sometimes it is, Some creamery managers and boards of directors are shrewd business men and do business on business principles and would rather pay a good buttermaker $100 per month than to take any chances with a cheap, inexperienced man, knowing that one-half cent per pound of butter, more or less, more than makes up the difference between a $50 and $100 per month man.

Some creamery boards have to "learn by experience" before realizing this fully. Such a case was very forcibly brought to my notice lately by the experience of a well-known Minnesota creamery, which was lucky enough to get a very good man as butter-maker for years at a low salary. His demand for a raise in wages of $10 per month was denied and he very properly hired out to another creamery.

The creamery board hired another man and have since lost several hundred dollars cash besides the good reputation which they formerly enjoyed for their butter, and have had such "costly" experience that they will likely not forget it for some years to come.

I have always thought that a good butter-maker is cheap at $75 per month, yes, even at $100, cheaper than a poor man at $50 and I still believe that the sooner our creamery boards learn to realize that this is true the better for the creameries as well as for the good butter-makers. Another thing which I believe to be equally true is that not one man in five, or less than 20 per cent. of all the men that try to learn the butter-making profession, succeed, or turn out to be truly first-class men. It requires such an endless amount of energy, "go-aheadedness" and "stick-to-edness" and attention to business that many who naturally are bright and brainy enough and who we would expect to succeed, fail to come up to our expectations, simply because the daily washing and scrubbing and long hours from 4 o'clock a.m. to 9 p.m. of hard work inside of a hot creamery in the summer and damp in the winter months is enough to hamper the ambition, health and good humor of almost any man.

Then if the ambition and good will is lacking, what about keeping the creamery clean inside, the platforms outside, the skim and buttermilk tanks under the hot ceiling or upstairs, stowed away in a dark corner; the milk pipes, etc., what about the quality of the butter if the milk or cream is poor, tainted, weedy, bitter, sour, and bad, the cans dirty, etc., and when he speaks to the patrons about these defects, that they ought to do better, take better care, and bring better milk, they may drive away angry, with the remark that they will go to another creamery or "ship" the cream?

What about skill and scientific buttermaking, use of starters, ripening of the cream by up-to-date methods, so as to improve the flavor another point or two in order to make it worth another half cent or make a good showing at a convention that he may gain a good reputation for himself, the creamery and the state, when the board of directors says he must be careful in sending home milk or cans so as not to lose any patrons, and possibly his own job, that sending butter to conventions are immaterial to the creamery, that if he wants commercial cultures and starter can and acid test he will have to pay for it himself, etc. Why, it will give four men out of five that "tired feeling" which again results in an unclean creamery, poor butter, run down machinery, etc.

These are some of the reasons why so many fail in gaining the distinction and reputation of being a first-class butter-maker, and why some men are cheap at $100. They keep up their courage and ambition in spite of everything; they keep good humored, talk kindly to their patrons, and gain their confidence and good will. Then the patrons will take any suggestion the butter-maker may make in good spirit, and try to bring better milk next time. The quality of the butter is improved by the improved quality of the milk, and the highest possible price for the butter is easily obtained, and it always did pay, and I hope it always will pay to make good butter. Poor butter has been in fairly good demand the last few years on account of increased demand created by the merits of the good butter, also increase in population; but we should not forget that history repeats itself, and that the hard times may come and the demand and price for butter may decrease. Then the poor butter will be a "drug on the market" worse than it is today. We should also remember that it is the lower grades of butter which keep down the market price on all grades and at all times.

The Imperial Press says: The Calexico Cattle Company is crowding its work ahead as rapidly as possible with a view to seeding about 400 to 500 acres to alfalfa this fall. Also that the California and Mexico Land and Cattle Company have bought two tons of alfalfa seed for immediate sowing, which is enough for about 200 acres.

It is not enough to have a well-bred dairy cow; you must feed her well and take good care of her if you want her to do her best. The same thing is true of the well bred hen.

KNOWLEDGE OF THE AVERAGE MILK INSPECTOR.

The knowledge possessed by the average milk inspector and, for that matter, the average physician, is well illustrated in the following account of a test examination made at De Kalb, Illinois, by an inspector who took with him several young doctors to be sure he would make no mistake. They came, milked and tested and then submitted their report to the health officers of the county when the test was made. The following letter printed in the Chicago Record-Herald shows the extent of their wisdom:

Editor Record-Herald: I notice in one of your contemporaries today that by the tests taken by Mr. Patterson of the pure food commission and Mr. Grady of the city milk inspection bureau the Holstein cow is condemned on the sample of milk taken from the cow that Mr. Patterson milked.

Now, as I was there on the invitation of Mr. Gurler, I happen to know something about the whole proceedings, and especially in regard to the milking of the Holstein cow in question. I naturally supposed all the facts would be given for publication, but for some reason they do not appear in either of the reports; hence, in justice to the dairymen in whose interests it is my duty to speak, and to do justice to that noble breed of dairy cattle that are being so much maligned by the city inspectors, I state the facts from a dairyman's standpoint.

Mr. Patterson did not milk the cow; he only partially milked her. He milked from the cow eleven pounds of milk, which, according to the published reports, tested only 2.8% butter fat. But what followed? I had one of Mr. Gurler's regular milkers take the cow immediately after Mr. Patterson was through and he got three pounds more milk from her.

This can be verified by Mr. Lundberg, of DeKalb, Alderman Fowler of Chicago, and A. J. Glover and myself. four tests were made of this three pounds of milk and it tested 6%, which does not surprise any one conversant with the quality of the last milk drawn from a cow, compared with the first drawn. Thus we have the following to submit as the test of the Holstein cow's milk that Mr. Patterson was supposed to have milked:

	Test.	
Eleven pounds milked by Mr. Patterson	.2.8	.308
Three pounds milked by Mr. Gurler's milker	.6.0	.180
		.488
14 lbs milk, average	3.485	.488

As the state test is 3%, this Holstein cow is still nearly 0.5 above. Why this was given to the public at 2.8 I fail to understand, as I informed Mr. Patterson what we had done before leaving the barn, wishing to be honest with him in the matter.

I am not personally interested in any Holstein cows, but I want to see fair play for all dairy breeds. I love the Jerseys and Guernseys, consider the Ayrshires splendid milkers, learning more every year in regard to the Brown Swiss, and for an all round animal believe the Durham cannot be beaten. Yours for simple justice to the Holstein.

JOSEPH NEWMAN,
Phesident Illinois Dairymen's Association.

WOMEN AND THE DAIRY.

I had the pleasure, a few days ago, of meeting in company with a few ladies who were all farmers' wives. The conversation drifted from one topic to another, finally one lady spoke something in this manner: She and her mother were performing the task of milking the cows while the men folks were absent on business. At this remark another lady spoke in a very decided tone. She never milked a cow in her life. She didn't know how and she never tried to learn. The first speaker seemed to think she had broached a disagreeable subject and, therefore, tried to withdraw a little by saying that she only milked one cow at a time and theirs was the only cow she ever tried to milk.

Oh, dear, how badly I wanted to tell them that milking a cow was certainly an accomplishment that any lady might feel proud of. I really think that farmers' wives and daughters should know how to milk a cow in case their help was needed when the men were absent. I do not mean they should be put to the disagreeable task of going into a dirty stable to milk, such as is found on most farms. I consider that milk drawn from a cow in a filthy stable is unfit for use. If farmers would pay more attention to keeping their cows and stables clean the task of milking would be more pleasant and the profits of the cow would increase, for they would soon receive a far better price for their milk and butter.

Cleanliness in the stable alone does not mean good butter; the rest is just as simple a matter. I think from what I have observed, that too little attention is paid to the scalding of the utensils used in and about the milk. You may think it strange, but I have actually seen ladies wash their milk crocks, churn and butter bowl with the same dishcloth they used to wash their dishes, and yet they seem to think they are strictly neat about their butter making. Good butter cannot be made with such careless work. Plenty of boiling water must be used (to scald everything used) as it quickly cools and then is of no use for the purpose intended. Fresh air and sunlight are the greatest factors for keeping out the bitter bacteria. Did you ever stick your nose into a milk pail that had been washed out and turned down all night without being scalded? It is those little things that cause so much cheap grease on the market.

I know some ladies are trying hard to make good butter, and they have to carry the water so far and they really have no place fit for keeping milk or butter. Now, let me say to those, you are working at a disadvantage, better give the milk to good heifer calves or little pigs and get ready to make butter first. Then you can demand a good price for your butter, and the merchant will be more than pleased to give it. Every one that owns a cow should take some good dairy paper and not neglect to read it and he will soon learn why he doesn't get a better price for his butter.

We often see so much talk to the farmer about his chickens. Now, do tell us of a farmer who is interested in the chickens on the farm. I really don't remember ever meeting one. Why, I never could get one on our farm interested enough to even clean out the hen house, unless I got right down on my knees and begged. The only time I ever saw our men folks show any signs of interest in the hens was when they smelled one frying in hot butter.—Mrs. F. G. Hall in Northern Agriculturist.

THE DUAL PURPOSE COW.

There has been considerable discussion in the agricultural press of late concerning the dual-purpose cow, or the combining in one animal both milk and beef qualities, and while the discussion has been fair and friendly, the lines are as tensely drawn as in the beginning, and agreement seems about as hard to reach as in a congressional convention. Now it seems to me this matter, like the story of the color of the shield in the old school reader, can be determined best owing to the view-point of the individual, if I were a breeder of pedigreed stock there would be no dual purpose cow in my herd. Either I should breed beef strains, something that would produce the most pounds of flesh with the smallest amount of feed in the shortest time, or I would go after the cow that would give the highest per cent. of butter producing milk; but for the general farmer or milk shipping dairyman there certainly is room for a dual purpose cow, one of a cross between the large framed, strong constituted beef breed and the more highly developed milk producers; a cow that will weigh ten or welve hundred pounds, with capacity to assimilate food enough to give 5½ to 6 gallons or 4 per cent. milk per day and that will drop a calf weighing from 150 to 175 pounds at four weeks of age. A cow of that description, if she does take on too much flesh for the dairy, can go to the block with profit at any time, and her sons will make profitable feeders, and a quality of steak fit for the gods; but if a dairyman who ships milk to the city trade and who does not raise his calves, has a little bit of a Jersey cow dropping a calf weighing 50 to 75 pounds, and don't want to raise it a butcher don't want it at any price, and it is too small for veal and too large for lamb, and as a rule he knocks it on the head to get rid of it; and if his cow for any cause (and they are legion) loses her value in the dairy, butchers don't want her, and she has to go at about what she will fetch. So we say there is room on the farm for a dual purpose cow, just as there is for a general purpose horse.—John G. Foight in National Stockman.

We have the best thing yet for preserving fence posts and all timbers under water or under ground, also for all iron roofing and pipe. If you will take sound, dry posts and properly coat with our preparation the part that is to be in the ground, the fence will stand up long after you are laid out. We manufacture the preparation (protected by patent) and ship in amounts required. One hundred pounds is enough for fifty posts. Any man can do the work. You melt up the mixture in a kettle, heat it to boiling point, keep it stirred and apply with a brush, if your kettle is not deep enough for dipping. Full directions sent with every shipment. The posts are ready for use as soon as the coating cools. The process is cheap and absolutely effective. Write for prices and particulars. We want an agent in every county.

THE WOOD AND IRON PRESERVING CO.,
319-320 Douglas Bldg., Los Angeles, California.

He (just introduced):—"What a very homely man that gentleman near the piano is, Mrs. Hopson." She—Isn't he? That is Mr. Hopson." (He (equal to the occasion) "Oh, indeed! How true it is, Mrs. Hopson, that the homely men always get the prettiest wives."—London Tid-Bits.

WORLD'S FAIR PRIZES.

Chief Coburn of the live stock department of the World's Fair has advices from leading Ayrshire breeders of an intention to enter that breed in the World's Fair cow demonstration. The Ayrshire men at the Illinois State Fair held a meeting and passed resolutions requesting the Ayrshire Breeders' Association to take early action toward inviting breeders to furnish cows for the demonstration. The resolutions were signed by W. P. Schenck, Avon, N. Y., as president and G. H. Converse, Woodville, N. Y., secretary of the meeting and the following committee: Howard Cook, Beloit, O., McCormick & Edgely, Pataskala, O., and Secretary C. M. Winslow of the Ayrshire Breeders' Association. The breeders present pledged their services and cattle toward making Ayrshire participation a success at St. Louis.

The Ayrshire Breeders' Association has already made an appropriation of $2000 in aid of the World's Fair Ayrshire exhibit.

The up-to-date dairyman knows which of his cows give the most and richest milk, and he keeps such ones for breeding purposes and gets rid of the poor ones. The poultryman should do the same with his hens; find out which are the good layers, keep them for breeding purposes, and weed out all the poor layers, for they are unprofitable.—Farmer's Tribune.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

EXTERMINATION OF CHICKEN MITES.

(Concluded from last week.)

In one case I tried to exterminate the mites in a henhouse by means of fire applied with a torch, but the attempt was unsuccessful. The flame was applied to the mites that were visible and they were destroyed. But the process was slow and care had to be taken so as not to set fire to the building. As soon as the interior had all been gone over once it was found that the mites covered it as thickly as before, they having crawled out from their hiding places. It was necessary to go over it several times before the number appeared to appreciably diminish and in a few days they were as plentiful as ever. The application of the flame to all parts is a very slow process and it is attended with some danger. It cannot be directed into the crevices so as to destroy the eggs or the mites which are in hiding. My experience convinces me that it is impracticable to exterminate mites by means of flame. The only way in which fire could be made effective would be to burn the entire building.

I next resorted to the use of kerosene emulsion and found it very effective. The emulsion is made as follows: Take one-half pound of hard soap and shave it into a gallon of soft water and put it on the fire and bring it to a boil. By this time the soap will have dissolved. Then remove the soap solution from the fire and stir into it at once while hot, two gallons of kerosene. This makes a thick creamy emulsion which is made ready for use by diluting with ten volumes of soft water and stirring well. It can be utilized as a spray, dip or wash.

It is necessary to use soft water, for hard water decomposes the soap and destroys its emulsifying power. In my experiments I used white laundry soap, but any good hard soap will do. For the sake of brevity I refrain from recounting my various experiments, but will detail in a general way a method of applying the emulsion based upon my experimentation which will be found effective by those who will thoroughly try it.

Make up as much of the stock emulsion as it is thought will be needed. This can be kept in a suitable vessel and a portion taken out and diluted as needed. If the bucket or holder attached to the spray pump holds five gallons, one-half gallon of the stock emulsion should be taken and put into the bucket or holder and four and one-half gallons of soft water added and the whole well stirred. It is then ready to be sprayed on the places occupied by the mites. A beginning should be made at a particular place and the whole habitation of the mites sprayed in a regular order of which account should be taken so that the same order may be followed in subsequent sprayings. The spray should be directed with special care into all crevices, holes, joints, or other hiding and breeding places of the mites.

The first spray of kerosene emulsion will kill within five minutes all of the mites and eggs with which it comes in contact, but many mites will be left in the hiding places unaffected by the spray. Hence the spraying should be repeated as soon as the first spraying is completed. Even this will not kill all the mites, hence a third spraying should be done as soon as the second is completed. At each repetition the beginning should be made at the same place and the same order followed as in the first. These three sprayings done in one day and in rapid succession will destroy nearly all of the mites, but, as my researches have shown, many eggs are left in places untouched by the spray. If mites are seen crawling about the building the next day, it should be sprayed again.

* * *

Young Mites.—One might ordinarily suppose that he had now exterminated the mites. But such is not the case. for, in about three days, a crop of young mites will be found hatched from the eggs which escaped the first spraying. If these would be allowed to go undisturbed, it would not be long until the building would be as badly infested as at the beginning. Therefore the spraying should be repeated once every three or four days spraying two or three times on each occasion, for about two weeks. The spray should be applied to every part of the building that is likely to contain the mites. In a two-story building they will crawl up the posts and find lodgment upon the second floor even if chickens do not go there. In one case I found a colony of mites on the outside of a small door in the second story of stable in which chickens were kept and which was badly infested with mites. If such a lodging place is overlooked, the mites will not be exterminated. The procedure just described will with very little doubt be effective in ridding a place of mites, but I would advise that a constant watch be kept and the spraying repeated when mites are seen at any subsequent time.

It is not necessary or advisable to exclude the chickens from their regular coop while the process of extermination is going on except while the spraying is in progress. If the chickens are deprived of their regular quarters, they will be compelled to select temporary quarters which will soon be as badly infested with mites as the old through multiplication of the mites which are caried upon the bodies of the fowls. If the chickens are not required to make a new roosting place, the mites which are carried out by them will either drop off upon the ground and perish or will crawl off into the crevices upon the roost and be killed by subsequent sprayings.

Extermination of the mites may be hastened by dusting the fowls with pyrethrum powder after they have gone to roost on the evening before the first spraying. The powder will drive the mites from the birds and, as a result, but few will be carried out the next day upon their bodies. The powder is applied by means of a powder blower. In practice I have not found it necessary to use the powder, for, as already explained, the mites which were carried out upon the first morning were finaly exterminated in other ways. However, if it is convenient to use the powder, the destruction of the mites will be facilitated.

The cost of the remedy is very small. The cost of making thirty gallons of the emulsion is as follows:

Two gallons kerosene at 18c	36c
One-half pound hard soap at 8c.	4c
Labor	5c
Total	45c

This will be enough to spray the ordinary farm hen house once.

* * *

SPRAY PUMP.

In order to insure good results it is very important to have a spray pump which is durable and which acts easily and effectively. Such a pump should be obtained as may be turned to any one of the farm uses to which a spray pump is adapted. While a very cheap pump may be made to serve in an imperfect manner, it will be found in the long run to be poor economy to try to save money by buying a cheap, poorly made pump. By investing seven to ten dollars a desirable article may be obtained. While a copper holder costs more it lasts so much longer than tin as to fully repay its cost. The Bordeaux nozzle should be used. With it one can get a spray of any degree of fineness and the nozzle can be instantly adjusted so as to emit a forcible jet in order to throw the spraying fluid into fissures and holes. There are many good, reliable makes of spray pumps and different kinds may be seen in almost any implement store.

* * *

DESTRUCTION OF MITE EGGS BY SPRAYING.

On July 11, a sugar barrel which was used as a nesting place by the hens and which was swarming with mites was sprayed with kerosene emulsion. Afterwards a hoop was removed and was found to be covered on the inside with a large number of mite eggs. These eggs had been thoroughly moistened by the spray, and the mites upon the hoop had been killed. A piece of the hoop was cut out and placed under a glass dish. The air was kept moist by placing under the glass dish a smaller dish containing water. Other pieces of the hoop were left lying in an outbuilding so that they might be under conditions as nearly natural as possible. Observations were kept up until July 20th, but the eggs failed to hatch and were at the end of this time shrunken and evidently in such a condition that subsequent hatching was impossible.

* * *

SUMMARY.

The chicken mite is one of the worst enemies of chickens.

The mites live and breed in fissures about buildings and feed upon the fowls when they go upon the nest or perch.

Mites may be introduced into a flock by a fowl or other bearer brought from infected premises.

Mites may be exterminated by thoroughly spraying the building and its contents with kerosene emulsion.

Kerosene emulsion kills not only the mites, but also their eggs, when it comes into contact with them.—Poultry Keeper.

Place the roost for poultry on a level.

One advantage in keeping poultry, is that they eat much which other wise would be wasted.

Avoid the mistakes made last year, and make good use of the useful things you learned last year.

Poultry make good insect destroyers for orchards. Have the runs extend into the orchard when possible.

The incubator lamp should be cleaned and filled every day at noon. This will give ample time to regulate the flame by night.

If the incubator is to be used in hatching chicks, look it over and see that everything about it is in proper shape before starting the heat.

Keep the poultry buildings and yard properly disinfected. One pint of carbolic acid, in eight gallons of water makes an excellent disinfectant.

It will pay you as well to give the poultry good care and attention, as it does your calves and pigs.

Some poultry keepers feed mashed potatoes and red pepper; the red pepper acclerates the blood, but it does not cause the hen to lay eggs, for it provides no elements for egg producing.

Keep the laying hens working. To do this, feed them at daybreak, and just before sundown.

The Petaluma Incubator Company sends the Cultivator a list of those who gained the highest points in the Australian hen laying contest for April, May, June and July. In the number are three Americans whose birds scored as follows::

Mrs. A. H. Hensel, R. C. B. L., 470 eggs
W. K. Hayes, W. Wya .....414 eggs
W. B. Candee, W. Wya.....245 eggs

WOMAN'S WORK IN THE POULTRY YARD.

If you were to commence again, how would you do it? This question was recently asked me.

As I did at first, by buying thoroughbreds and gradually increasing my flock. This is the usual advice of all poultry books and poultry breeders, a good advice it is, because one can more easily study a small family, learn its ways and its needs, and if there are any sad experiences or accidents, the loss is not so heavy as if many were involved. Or, if I could not afford to buy a pen of thoroughbred fowls I would get thoroughbred eggs and commence my flock with them.

Why are thoroughbreds better than mongrels? The reasons are many. First, you can depend upon the pure breed for uniform growth. Mongrel chicks will vary in size, they never grow fast, and one or two in the flock will be ready for market two months before the others. Look at the waste of food. Not only this, the pure bred are uniform in looks, after dressing for market, and will sell higher on that account. Their eggs and themselves bring a much higher price than mongrels, and they lay many more eggs. Besides there is a satisfaction in possessing a nice, uniform flock of fowls, of the same approximate size, color and appearance, that can never be felt in owning a flock of mongrels of divers sizes, shapes and colors.

But to return to my subject. If I wanted to make money from the start, I would invest in several incubators of the best make, and hatch eggs for other people. Follow the instructions of the incubator maker carefully, use common sense and study the machine. Here let me repeat the warning that I gave last year, test your thermometer, old or new, or get it tested at a drug store. It is easy to test it at home by using a little care. Borrow a doctor's, or clinical thermometer. Take a bucket holding at least half a gallon of warm water. Immerse two thermometers in it, keeping the water stirred, and compare the two. If your thermometer is half a degree higher than the clinical, you must run the incubator half a degree higher than your directions—if your thermometer is lower than the clinical, the incubator must be run that much lower. The thermometers are apt to vary until they are two years old and seasoned. I test mine every year. There are so many little things in the chicken business that negelected bring failure.

In hatching eggs for other people—please consider that this means you—charge when the eggs are shipped five cents for each chick hatched, and two and a half cents each for infertile eggs, which will not hatch, as they take up space in the incubator, and if such a charge is made those furnishing the eggs will try to have them all fresh and fertile. Young chicks from your own eggs can be sold straight from the incubator, not over twenty-four hours old, at from ten to twenty-five cents each, according to quality and breed, or if kept longer, a charge of from two and a half to five cents each per week would be fair to both parties. After one gets accustomed to the use of incubators and brooders, the work seems easy and one can go ahead with surety, but it takes a certain amount of experience; it is something that one must learn for oneself. Books, rules, other people's observations, are undoubtedly an assistance, but one's own experience teaches more effectively, and "if at first you don't succeed try, try again."

To hatch a chick in an incubator costs on an average from six to seven cents, counting the price of the egg at 25 cents per dozen, the oil used, etc. If that chick can be sold at ten or fifteen cents you have a return of from fifty to a hundred per cent on your outlay. Those chicks that are not sold can be raised for broilers or fryers. A broiler weighs about a pound and a half, a fryer from two to two and a half pounds. These sell rapidly at from thirty-five to fifty cents each.

Before leaving the subject of incubators, I will say I have found as a rule, that most of the hot water incubators I have tried have not ventilation enough for this climate. This is shown by the eggs not drying out sufficiently, the air space does not get large enough. A very good plan to test your incubator is by setting a hen at the same time and every few days test some of her eggs and some from the incubator. If those in the incubator do not show as large an air space as those under the hen, they require more ventilation, the ventilator should be opened and the eggs aired by being taken out of the machine at least twice a day and left out from ten to twenty minutes according to the warmth of the room. I am writing of the California climate at about two hundred feet above sea-level.

When chicks die in the shell it is either from weak parent stock, or the eggs have not been dried out enough, or there has not been sufficient oxygen in the incubator to keep the chicks vigorous, or the incubator has not been run according to directions.

Crippled chicks come from the same causes, especially from irregularities in the temperature. Very often the great, strong, beautiful chick has grown so big, has so little air space, that in his struggles to get out he dislocates his leg, usually left leg, at the knee joint. I suppose some one more clever than I might set that leg. I have generally pushed the joint in place but am not surgeon enough to keep it in place, so the cripple is consigned to an early grave.

My next will be on brooder chicks.

ANSWERS TO QUESTIONS.

Editor Cultivator: Will you kindly tell me through your paper the causes of and remedies for a disease among chickens which causes the head to become hot and swollen, the chick as the disease progresses becoming blind and deaf, finally refusing food and dying. Is it contagious? Subscriber, J. A. S.

I am sorry to say your fowls have roup. Sometimes called contagious catarrah. It is very contagious. It usually commences like a common cold, but when it comes to such an acute stage as you describe, the hatchet is the best remedy, and bury the remains deeply. Disinfect the buildings and yards, and if there are only a few slightly sick left, doctor them with the roup cures that have been given in the Cultivator.

Sand is not grit, it is too fine; gravel from the creek is not grit, the action of the water has worn off all the sharp edges. Grit to be of any service to the fowl must be hard and have sharp edges. When these are worn off the grit is discharged with the other waste from the fowl's body.

Swollen legs and feet of fowls is often caused by keeping them on a hard floor.

If poultry need a little extra feed it is a good time to give it to them just before they go to their roosts.

Chickens will moult much quicker if they are kept in a good growing condition.

ROUP and CHOLERA

Get the Habit of using PALMER'S POULTRY POWDERS in your poultry pens and you will have no other.

PALMER'S POULTRY P P POWDERS — Trade Mark

We have what you've been looking for—a guaranteed cure for Roup and Cholera—something that cures in every case if used according to directions. Palmer's Poultry Powders—the only infallible remedy ever offered the public for Roup and Cholera. Manufactured in your own State by the

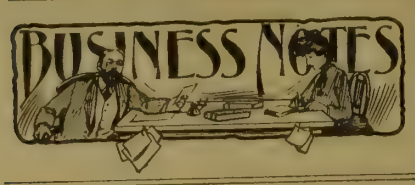
When writing to Advertisers Please mention Cultivator



WE NEVER LET UP.

The advertiser who expects an advertisement to be an all 'round cure-all, and to be able to carry the burden of the business is sure to have disappointment, as the result of his advertising. Once in touch with a possible buyer, the matter must be followed up. The advantage of the particular article advertised, and the possibility of full value for the money must be shown. This may be in the first letter, the second or the fourth. But follow up every inquiry. The persistent advertiser wins.

This truth was shown most conclusively in a recent conversation with R. M. Teague of the San Dimas Citrus Nurseries.

We asked Mr. Tague how he had worked up such an immense business in selling citrus trees in the few years he has been in the nursery business. We knew, of course, that it came largely from a reputation established from fine trees, true to name, and always square dealings. At the same time, how had he gained his reputation. And his answer was, "Well, we never let up." Always growing good trees, always advertising it in the best papers, and with a good follow-up system. Especially this last idea, for it often takes time to reach the purchaser, when he is in the right frame of mind and is ready for business.

Sometimes we are told by our advertisers that "your adds bring many inquiries, but we make few sales." Was this the fault of the paper or of the business man who did not show the full worth of his wares so as to land the customer.

The "never let-up," policy would have done it.

By the way, it may be in order to state that Mr. Teague's stock for the coming year is as fine as it is large. And on quality it is safe to say that no greater number of budded orange trees were ever gathered together.

Navels, Valencias, Japanese, grape fruit, lemons, everything in citrus trees. Whatever you want take it away from Teague's.

Already a number of sales were made, which indicates the season is not so backward and that many plantings of citrus trees will be made.

The catalogue which Mr. Teague issues this year is by long odds the finest and largest he has ever put out. It is of fifty-six pages, of Antique book paper, with inserts of coated book for the half-tones, of which there are thirty-fve different scenes, of the nurseries and of orange tres.

If you contemplate buying oranges, send for it.

* * *

W. D. Anderson, of San Bernardino, announces his ability to sink artesian wells in any size from six inches up. Mr. Anderson has a large power rig, which enables him to do first-class work expeditiously. A card dropped to Mr. Anderson will bring estimates of cost and as to time when he is open for engagement.

Their store is located on the corner of Spring and First streets, Los Angeles, and is filled with a magnificent stock of goods. Strictly reliable in dealing, with best of goods at fair prices, gives this firm a strong pull, country trade as well as city.

* * *

A PRESERVATIVE FOR FENCE POSTS.

The Wood and Iron Preserving Co. of Los Angeles are putting out what is said to be an excellent and cheap preservative for posts, bridge work, and other exposed timbers. It has been long known that coal tar and some like substances preserve wood, but when applied as an external coating they have deteriorated and broken down through the action of salt water. To obviate this difficulty the inventor of this process mixed with hot asphalt Portland cement. The cement does not combine with the asphalt, as cement does when mixed with water, but forms only a mechanical mixture. The timber being covered with this mixture and exposed to water the particles of cement that happen to be upon the surface "set" in the water, and form a hard, impervious but extremely thin coating about the asphalt, preserving it against the effects of water.

WILL MOVE THE CROP.

Advices from Chicago state that the railroads are making arrangements to move the great crop of 1903-4 without delay. To do this immense orders for cars and locomotives have been placed with eastern roads from which these equipments will be borrowed.

Something of an idea may be gained of the great wealth in store for this state when it is estimated that the lemon and orange yield for 1903-4 will be 30,000 car loads; 7000 more than the crop just moved. The estimated value of this crop is $20,500,000. Last year's shipments were 22,500 car loads, value $14,000,000. The Herald suggests that the railroads propose to move this season's crop by months as follows: November, 1000 carloads; December, 3000; January, 2000; February, March, April, May, 4000 each month; June July and August, 2000 each month; September and October, 1000 each month; total, 30,000.

The editor of the Cultivator is in receipt of a leter from a prominent railroad man in the east, in which he says that the California transportation companies are placing heavier orders for refrigerator cars and locomotives this season, with eastern roads, than ever before, and that in his judgment no trouble wll be experienced in moving the citrus crop of 1903-4. There is one thing which guarantees quick movement of crops this year and that is, the increased facilities of the California railroads. For the past year they have been placing large orders for cars and locomotives.

A SUBTERRANEAN RIVER.

A syndicate of water developers has uncovered a subterranean river in the territory of Santa Monica with a volume of 73 inches. The water was reached at a depth of 15 feet. This will insure abundant water for all the Santa Monica and Hollywood district.

The California Fruit Growers' Convention will be held at Fresno commencing December 8th. A committee to arrange a programme has been appointed, consisting of Leonard Coates, John S. Dare and B. E. Hutchinson.

U. S. Senator Detrich of Nebraska, who has just returned from an extended trip through Alaska, says he does not think that territory will ever make any advance agriculturally, but that it will become one of the richest of our mineral possessions.

In taking up trees for transplanting, care should always be taken to save as many good roots as possible. The roots are the life of the tree and good care should be taken to preserve them. No careless digging, no exposure to sun or rain, or anything sufficient to kill the tender roots should be allowed.

C. W. Leffingwell of the Lemonita ranch near Whittier, has been given the gold medal at the recent congress for his exhibit of lemons. This was the highest award. Mr. Leffingwell is an authority on lemons, and on his large ranch more than 200 acres of which is planted to lemons, are many unique features of his own devising. He picks, packs and markets his fruit and insists that unusual care be observed in all the work. As a consequence he has only a minimum of decayed fruit, and gets fine prices. At his packing house this month were to be seen boxes of lemons in the best of condition which were picked and packed last November—nearly a year ago. —Times.

BEANS FOR THE WORLD.

Fifty tons per day of Lima beans grown in the Santa Monica district are being run through a cleaner at a Santa Monica warehouse, and a large proportion of that quantity is being cleaned by a like machine at a warehouse at Palms.

According to estimates made this season's crop, which means practically the "visible supply" for the world, amounts to 755,000 sacks, distributed in the following proportions: Ventura field, 600,000; Santa Monica field, 120,000; Santa Ana field, 35,000. The estimated average weight is eighty pounds to the sack.

There are at present about 50,000 sacks of beans in the Santa Monica warehouse and orders have been received for all of that quantity. This season's acreage of Lima beans for the Santa Monica field numbers about 8000. Next year it is expected there will be 10,000 acres in that field devoted to Lima bean culture. Considerable areas not heretofore in beans have been leased for that purpose for next season.

ANTHRAX.

The two most virulent diseases which cause most loss to stock growers, are anthrax and blackleg. The two diseases are in a way similar in symptoms but the diseases should be treated differently. In anthrax, which is an infectious disease, and because of its frightful mortality is one of the most dreaded diseases which attacks the brute creation. Like its running mate blackleg, it developes so rapidly when once it attacks that it is almost impossible to check its ravages. It usually comes in summer or early fall when feed is changing.

Anthrax is a germ disease, the germs entering the body usually through feed, but some times by contact with earth where carcasses of animals who died with the disease have left the germs so exposed as to permit of their being brought in by scratches on the hides of the animal. The germs are very hardy and live in the soil for a number of years. They may be carried long distances without losing their virulence, and may be conveyed to a farm, ranch or plantation in a vast variety of ways. The grave of an animal that has died of anthrax will keep the land infected for nine of ten years, and the stock grazing on such land are liable to contract the disease. A stream running near such a grave will carry the infection all along its course; fodder cut near a grave may contain the germs and infect the animals fed upon it. Hides are a fruitful source of infection. Cattle, etc., driven through a district where the germs of Anthrax exist are liable to and frequently take the disease. Anthrax is highly contagious, and one sick or dead animal may infect not only a whole herd but a whole region.

The only sure preventative of the disease is vaccination. This will put a stop to the disease and if proper care is taken not to expose living animals to the bacillus of dead ones will eradicate the disease entirely from a herd.

Director Alexander G. McAdie makes the following report of weather and crop conditions for the week ending October 19, 1903:

The rain of the preceding week was less injurious than anticipated.

Oranges are in excellent condition in all sections and colored rapidly during the week; the first of this season's crop arrived in San Francisco from Rocklin, Placer county, on the 15th, which is about two weeks earlier than previous records for the state. It is expected that the orange crop will be above average in quality and quantity. Grape picking continues in some sections and large shipments are being made to markets and wineries. The first crop of raisins is practically all secured and the second crop is curing rapidly; a few days of favorable weather will insure the safety of the raisin and prune crops. Prunes are of better quality than usual, but the yield is below average. No reliable estimate of the raisin crop has been received, but it is believed to be fully average. The season has been in most respects a very prosperous one for orchardists, though the apple and pear crops have been quite badly damaged by codling moth. Walnut trees are below average in yield, but are reported excellent in quality.

Beans and sugar beets are nearly all harvested; both crops are about the same as last season's. Potatoes are said to be below average in some sections. Corn harvest is progressing. Dry feed is scarce and cattle are in poor condition. Plowing and seeding continue in some places.

SAN JOAQUIN VALLEY.

Clear, warm weather prevailed during the week, with light winds; conditions very favorable for raisin making and prune drying. The first crop of raisins is all cured and moving rapidly to packing houses; the second crop is curing satisfactorily, and with a few more days of favorable weather the entire raisin crop will be beyond danger. Prune drying is nearly completed; the quality of the fruit is much better than that of last season. There are still a few late grapes on the vines in some sections, which are being rapidly picked, shipped and sent to wineries. The fifth crop of alfalfa is being harvested in San Joaquin county, and alfalfa thrashing continues in Tulare county. Plowing and seeding are in progress in Merced and Stanislaus counties.

SOUTHERN CALIFORNIA.

Generally clear weather and abnormally high temperature prevailed most of the week, with occasional fogs along the coast. Bean harvest is nearly completed and thrashing is progressing rapidly; the crop is below expectations in most places. Sugar beet harvest is practically completed, and the Oxnard factory has closed; the crop is reported about the same as last season's. Wine grapes are moving rapidly, and late peaches are going to canneries. Raisin making and fruit drying are nearly completed. Oranges are in excellent condition; the trees are heavily laden with fruit of large size. Walnut picking continues.

A great storm is reported to be due on this coast in December. Shipping interests are cautioned in advance to prepare for it.

THE OLD HOME ON THE HILL.

There are voices ever singing of the loved and long ago,
And the sweetness of the music makes us glad to have it so.
But when memory holds me captive and my thoughts run as they will,
They revert with childish fondness to the old home on the hill.

I can see the tree tops waver, as the breezes linger low,
While the sunshine pales in glory to the mystic afterglow.
And the shadows hang so deeply in the streamlet by the mill,
As the moon spreads forth her grandeur, o'er the old home on the hill.

I can recollect emotions, thrills of joy and pulse of pain,
That my heart was keen in knowing as they flooded through my brain.
But the love lights shimmer richly, like the tide that'l never still,
Shedding beams of endless halo 'round the old home on the hill.

I am sailing o'er life's ocean with my Leader in command.
And he'll guide me when he pleases to my own, my native land.
But my frail heart often longeth, while mine eyes with rainbows fill.
For another happy meeting in the old home on the hill. —Slow-Go.

Determined to Wed.

Arnold Treat was thirty-five and an eminent man. When he spoke in court the people turned out to hear him and were spell bound at his eloquence. A number of young women set their caps for him, but he would have none of them.

At last he met Eugenia Duffield and was captured. Miss Duffield was twenty-eight and director on the boards of hospitals and helping-hand societies. She had a fine figure, a firm step and carried her head erect on her shoulders. Her administrative ability was remarkable and it was this that made her valuable as a manager.

When Miss Duffield and Mr. Treat announced their engagement the world said, "What a splendid match!"

All went well with the lovers till one day a suit was brought against one of the institutions of which the lady was managing director, and she put the case in the hands of Mr. Treat. In submitting it she told him the incidents leading up to the trouble, to which he listened attentively. Then she gave him the line of defense he was to pursue, to which he listened respectfully. She finished by stating what she conceived to be the law bearing on the case, and he appeared a trifle bored. As a last word she directed him to proceed in every particular on the lines she had laid down.

"Do I understand," he asked, "that I am to try the case as your assistant or your attorney?"

Miss Duffield without a word folded up the papers and marched away with the remark, "You'll not try it at all."

Before the end of a week it was announced that the engagement was broken. Nevertheless the breaking of it was a great disappointment to both Mr. Treat and Miss Duffield. It was finally renewed after she had acknowledged herself in the wrong, for her brother was a lawyer and told her she had acted like a fool. For awhile the couple were very happy. Their trouble came again, this time from the side of the man. He had a protegee, whom he endeavored to get into Miss Duffield's hospital. She informed him that under the rules the patient was not admissable, whereupon Mr. Treat remarked that he would apply at a hospital where there were more elastic rules.

"Do you mean to imply," asked Miss Duffield, "that our rules are not proper ones?"

"They are not such as I would approve. I am on the board at St. Luke's, you know."

"Our institution doesn't follow the leadership of St. Luke's by any means. I think you had beter take your patient to your own hospital."

"I did not ask your advice. I asked admittance for the patient at your hospital."

Immediately after this interview it was announced again that the engagement was broken. "That will never be a match," said a veteran matrimonial observer. "You might as well put two captains in command of the same ship."

However, the two lovers were miserable apart, and this time at the suit of the man they came together again. Then they concluded that once married they would learn to work in double harness and decided to make a plunge into matrimony, and the wedding day was set. One day Mr. Treat drove up to Miss Duffield's residence and, alighting from the cariage, ran up the steps and rang the bell.

"I have just heard," he said when his lady love came down, "that our wedding is to be the largest and most brilliant ever held in this city. This I hear from others, while I, the principal participant, have not been consulted."

"First," replied Miss Duffield, "I was not aware that you were to be the principal participant; second, I consider you on such an occasion without any rights whatever, and, third, the woman's will as to marriage ceremonies being absolute, I did not think it necessary to inform you."

"I think it necessary," said the groom expectant, flushing, "to inform you that I detest spectacular performances and would not consent to make a guy of myself on any account."

"You'll neither make a guy nor a groom of yourself with me," replied the lady. "We will consider this affair off for the third and last time."

The next step in this affair, after weeks of misery on the part of both, was a note from the man, which by a singular coincidence crossed one from the woman. The man's note asked for an interview; the woman's invited him to call. When they met the man began:

"I have called to say that I have found it impossible for me to live without you. I confess that I expected to find it impossible to live with you and have my own way about anything. Therefore I have called to beg for one more trial. The first time I attempt to have my own way you may break the engagement."

"I have come to a similar conclusion," said the woman. "I confess that I have been very miserable. I have sent for you to say that if you care to try it once more we will be married as privately as you wish."

"That is the woman's part. I am ready to submit to as resplendent an affair as you desire."

They were married before a few friends and went on their wedding trip. That was five years ago. They are married today and comparatively happy. But they do not live as married people usually live. The man lives at his club, the woman at her own home. He dines with her twice a week and frequently takes her to the opera or the theater.—Mary T. Pierson in Encinal.

SHE BOUGHT IT.

Peddler (opening his pack)—"I have here, madam, an improved rat trap, which—"

Woman of the House—"We are never troubled with rats."

"Which can also be used for cracking nuts—"

"We never use nuts of any kind."

"Or as a coffee roaster. Adjusted in this manner, it—"

"We always buy our coffee roasted."

"Just so. Reversing the wires that form the upper portion, and bringing down the side flaps, thus, we have a device for holding eggs when cooking—"

"We never eat eggs."

"And by folding these wire loops, as you see me doing now, it makes a handy arrangement for holding a small mirror—"

"Haven't the slightest use for such a thing."

"While, by adjusting another small mirror in this position, and another at this angle, as you will notice, and placing it in a kitchen window, for example, it has the curious effect of enabling the observer, seated at one side of the window and entirely out of sight, to see distinctly through any window that may be opposite, and to note what is going on inside, and all I ask for this most useful and comprehensive invention is 75 cents, which is about one-half—"

"I'll take it."—Evening Express.

HYGIENE OF THE HAIR.

In order to give to your hair the hygienic care which it demands it is necessary, ladies, that you should know:

First, that the scalp dislikes dampness, which soaks it, and is hurtful to its vitality.

Second, that the scalp requires constant airing, to assist the evaporation of prespiration and other secretions of the skin, which have as injurious an effect upon it as dampness.

Third, that both the scalp and the hair dislike violent twisting and pulling, which put their strength and solidity to a hard test.

These three fundamental principles being known, they should be remembered and applied in the best way, and as frequently as possible.—October Woman's Home Companion.

WE SHOULD NOT FORGET.

A mother who has laid away a golden-haired, blue-eyed daughter of seven summers, said recently, "Life has no charms for me, my love lies buried in the grave with Lillian." I wondered at the remark, for the lady has a kind and provident husband, a neat and well appointed home and sufficient of this world's goods to make her comfortable. But these blessings she has entirely forgotten in the loss of her little girl.

It did not appeal to her that the one she mourned as dead, is as much alive today as ever; that she does not "sleep under the flower decked mound they call her grave;" that somewhere in the confines of a sun-kissed sphere she is steadily progressing, spiritually developing into a being of beauty, intelligence and love. In the mother's view of death her child is lost to her and to her life, and mourning as she does, she sees no beauty in this lovely world. The song of birds does not greet her ear with melody of joy. The brilliant flowers do not tempt her eyes to linger on their loveliness. Kind friends do not awaken her to thoughts of happiness and love.

Why?

Because in her way of looking at so-called death she sees only eternal separation, isolation and sorrow. She does not comprehend the great fact that death, so-called, is not to any mortal nor to anything. She closes her eyes to the all important fact that when we leave our mortal form in this world, we but begin to live in a better, higher, broader sense, and in a world of matchless splendor and never ending growth and energy. "There is no death, what seems so is transition." There is no going out of life, for life is eternal. There is no cessation of work; for in the spheres above our earth plane there is energy unbounded. To believe other than this is to discredit the doctrine of immortality so clearly enunciated in the book of books—the bible—that has been man's g ide and hope for countless decades.

But this mother makes the further mistake of burying her affection in the grave and robbing the living, those entitled to it, of its worth. "There is nothing in all the world we can do for the dead," said Ingersoll, but everything may we do for the living.

When opportunities are so abundant to do good to others about us, it is a mistake to close our eyes and our hearts to those God-given conditions, for in the exercise of these grand opportunities we add joy to other lives and blessings to our own. We should not forget when sorrow overwhelms us and our sky is overcast with dark tempestuous clouds; when those we love "take wings and fly away," that we are not forgotten, but in our grief brought nearer to the life divine.

Let us not forget that we are ever in the eye of the Supreme Being, under whose infinite care we live now and shall live evermore.

"God gives his angels charge
Of those who sleep;
Yet does Himself a watch
And vigil keep
With those who lonely wake
And grieving weep."

A HORSE'S DEVOTION.

"One of the strangest instances of animal devotion of which I ever heard was that of the favorite horse of my brother, Major Frederick W. Matteson," said Mrs. Clara M. Doolittle, a tenement inspector, the other day. "During the civil war after my brother reached Corinth, Miss., as a major in the Illinois Yates sharpshooters, he was stricken with fever and soon died.

"During my brother's illness his favorite horse Sahib was tethered a mile away from the wilderness of tents in a small cleared enclosure. One morning the groom, who visited the horse daily, was unable to find it, and after searching for hours came to report the loss to my brother. Imagine his surprise to find the animal contentedly standing in the tent with its head touching my sick brother's breast.

"The horse had broken away from where it had been tied and found its way to the tent alone. It persisted in staying near the tent, and the soldiers, moved by its devotion, did not attempt to drive it away. A few days later Sahib, without a bridle, followed the ambulance which carried the body of his master. For three days after my brother's death the horse refused to touch food, and was inconsolable."—Chicago Inter-Ocean.

LITTLE BOY BLUE.

The little toy dog is covered with dust,
But sturdy and stanch he stands;
And the little toy soldier is red with rust,
And his musket moulds in his hands.
Time was when the little toy dog was new
And the soldier was passing fair,
And that was the time when our Little Boy Blue
Kissed them and put them there.

"Now, don't you go till I come," he said,
"And don't you make any noise."
So toddling off to his trundle bed
He dreampt of the pretty toys.
And as he was dreaming an angel song
Awakened our Little Boy Blue—
Oh, the years are many, the years are long,
But the little toy friends are true.

Aye, faithful to Little Boy Blue they stand,
Each in the same old place,
Awaiting the touch of a little hand,
The smile of a little face.
And they wonder, as waiting these long years through,
In the dust of that little chair,
What has become of our Little Boy Blue
Since he kissed and put them there.

Eugene Field.

PROFIT AND LOSS

The outlaws was thick around Toomstone county and I kep' a store there. I sold 'em goods and trusted 'em when they hadn't no money, for you kin trust two kinds o' people—them as is honest and them as is at open war with the rest o' the world. It's the middle classes that beats you. There was one on 'em—the outlaws, I mean—that I didn't want around, for he'd carried things too far and there was a price set on his head. That was Dandy Jim. Dandy Jim's head was worth $1000 to any man that could git the drop on him.

I was always a-figurin' how I could git him in a trap and git the reward. There wasn't no use in tryin' to do the job in an ord'nary way, for Jim was as cool as a cucumber and slicker 'n a greased pole. I'd have to fix some way o' gettin' a pint ahead. What I wanted was a confederate; some one to do the shootin' while I did the foolin'.

One day a young woman come to my place and wanted to work in my store.

I tole her I didn't want a woman, but she said she'd work for her board, and after talkin' to my wife about it I engaged her. She could do most anything, but she was handiest about keepin' my accounts. She must a' been a schoolmarm, for one day she took account o' stock and figured up and told me 'xactly what I was wo'th.

"If I could get Dandy Jim," I said to her, "and turn him in dead or alive I'd be wo'th $2000."

"But they say Dandy Jim's a hard man to take," she said.

"Maybe he'll come around here some day and I'll try it."

"How would you manage it?"

"If I know'd he was acomin' I'd post some un outside to cover him. Then if he got the drop on me I'd signal the outsider to shoot him."

"What kind of a signal would you give? He'd shoot you before you could make any signs."

"Well, he'd likely tell me to throw up my hands, and that would be as good a signal as any."

"You're purty smart," she said. "I didn't give you credit for so much sense."

One day the gal tole me that the stock was agittin' law, and if she was me she'd sell the balance and go and lay in a complete new outfit. She was sich a good business woman that I did whatever she said, and I got up a "sale" and cleaned out everything. It fetched just $1200 in money, and with this I concluded to put in the new outfit. The day before I went away I rode out to collect a debt of $50. I had a safe in which I kep' the $1200 on hand and didn't worry about it, for none o' the outlaws could open it and it was too heavy for 'em to carry away. The gal tole me I might's well leave her the combination in case any one wanted any bills paid, but I was too sharp for that. Not that I doubted her honesty.

Well, I got my $50, and when I was a-ridin' up to the store I see the gal a-comin' excited-like to meet me.

"What's up?" says I.

"Dandy Jim's there waitin' for you."

"Humph," says I. "What's he goin' to do with me? Kill me?"

"Oh, no; he won't kill you. If you was dead, who'd open the safe?"

"I see."

"You might do what you said you would if he came."

"What was that?"

"Have some one cover him when you go in and when he tells you to throw up your hands shoot him."

"There isn't a man about the place."

"Reckon I'll do. I'm as good a shot as any man."

Well, I posted her at a winder with a rifle right where she could see the man, then I walked into the house and the room where Dandy Jim was a-settin'. "Howdy, Jim," I says. "Howdy," says he. "Jim," says I, "there's $1000 offered for you. Reckon I might as well have it as any one." "How you goin' to git it?" he answers. "Well, there's two ways. One is dead and the other's alive—whichever you prefer." "I prefer dead," says he, "and considerin' I've got my hand on my gun I thinks it's you that's dead. I'll trouble you to throw up your hands." If I does that, I says, the drops on you, seein' I got a pal posted outside the winder to shoot you as soon as I raise an arm. It is a signal." "You're mighty smart," he says. "It's only takin' time by the forelock," says I. "Who have you got outside?" "One o' the best shots in Arizona, though nothin' but a woman." "Yes, and mighty shart if she is a woman." "How do you know that?" "Because she's my wife. I sent her here to git you to turn your stock into cash, then she sent for me to take it in." "Is that the game?" I asked, a cold chill runnin' down my spine. "You can find out," he say, "if you'll throw up your hands." "I'll do it," says I, "and if you're lyin' you'll pay for the deception with your life."

With that I throwed up both hands and the gal instead o' shootin' comes to the winder grinnin', and asks me if that was the signal and whether we hadn't better wait a spell, and if it wouldn't be cruel to shoot a man in cold blood. Then I knowed the game was up, so I tole 'em I'd open the safe—for it was plain I was a dead man if I didn't—and while the gal kep' me covered Jim took the plunder, includin' the $50 I'd just collected. Then the gal tuk my best horse and my wife's saddle, and as they galloped away she sung out:

"I made a mistake in the accounts. There's $12.50 to be charged up to profit and loss.—Frank Taylor Coyne.

HIS LITTLE SCHEME.

He was cutting an item from a newspaper. "It tells how a house was robbed, and I want to show it to my wife," he explained.

"What good will that do?" a friend inquired.

"A whole lot," was the reply. "You see, this house was robbed while a man was at church with his wife."

"Say!" exclaimed the friend, excitedly, "you havn't got a duplicate copy of that paper, have you? I want to show it to my wife."—Chicago Post.

Recipes...

GRAPE CREAM.—Stew one pound of grapes until soft, then strain through a coarse seive; add one cupful of sugar and a teaspoonful of gelatine dissolved in one-third or a cupful of boiling water. Do not chill, but let it become firm; beat the whites of three eggs stiff with sugar, mix them with a cupful of thick whipped cream, and pile irregularly on the top.

GRAPE SHERBET.—The Catawba and Delaware grapes are excellent for this. Wash the grapes and strain through a coarse cloth. To every quart of juice add a pint of water, the juice of an orange, and powdered sugar to taste. This may be partly frozen or merely chilled and served with chopped ice.

COOKING APPLES.—The apple is chief and sovereign of all the fruits, thinks a celebrated cook, and is adapted to food purposes as well as any other food product on the face of the wide, wide earth. Then revel in it while you may. There are limitless, irresistible apple receipts:

APPLE CUP CUSTARD.—Pare and core four good sized apples, steam them until tender, pass through a colander; add while hot a teaspoonful butter, yolks of four eggs, four tablespoonfuls sugar one cup milk. Turn this into baking cups, bake for tweny minutes. Beat the whites of the eggs until stiff, add sugar, beat again, heap over to the top of the cups, dust thickly with powdered sugar, and brown a moment in the oven before serving frizzling hot.

* * *

STRAWBERRY JAM CAKE.

One half cup buter, one cup sugar, one cup strawberry jam, three eggs, five spoonfuls sour cream (milk will answer) scant teaspoon of soda, one teaspoon cinnamon, one teaspoon of lemon extract, two and one-half cups flour. Bake in layers, put together with white frosting.

NO BOILED DINNERS.

The old custom of a boiled dinner for one day in the week and potatoes and cucumber pickles ad libitum the rest of the time has long since disappeared, and with it many of the people who followed it. Appetizing salads and well cooked vegetables are now daily partaken of in humble as well as in palatial homes, and are recognized as a component part of a dinner. This is in great measure due to the excellent teachings of cooking schools and domestic science classes in colleges; instruction which has revolutionized not only the vegetable idea, but has given us the why the old fashioned boiled dinner should be relegated as a dyspepsia producer.

Men's Shoes

The only proof of good shoes is the service they give. You get them here—newer in style, better in fit, longer in wear.

The Rurul Home...

The happiest life in the world is that of the country, and every where the dream of city people seems to be to have a nook of their own in the country, so strongly does rural life appeal to the educated and refined, that even with limited purses they seek the quiet pleasures that the farmer's wife and children often neither prize or understand how to use.

"Oh! be he King or Peasant—he is the happiest who in his home finds peace," says Gothe.

The sweet peace of the country—where the air is full of the warm scents of flowers and ripening seeds, and the music of the birds ushers in the morning and sings vespers at sunset. The approaches to a home may be made to add greatly to its dignity. The driveway should be wide and sweeping in broad curves, by making the entrance road not less than forty to sixty feet in width and ridging up a driveway in the center, the sides can be checked off and planted to alfalfa, this making a green border pleasing to the eye, and also gives a return for the use of the land. On each side trees should be planted—now as to the variety that must depend on the location. We like palms best, as they give the stately effect of a colonnade, their brown trunks with the gray clinging dead leaves and the half arch of the green leaves of the springing top garden is built, they are in harmony, for this same reason, growing vines of their trunks by softening the lines is undesirable, for by making beautiful the individual, the classic outline of the colonnade is lost.

* * *

When the avenue reaches the lawn, and the trees around the dwelling, the stiff formality should be softened into the mass of foliage by setting two or three palms out of line and as part of the garden, for, after the set order of trees planted at regular distance apart, if the repose of the garden is not gently led into, there is a jar like music out of tune. Somewhere in the Hindu writers, there is a tribute to the palm, to its value as the friend of man. It ends with the beautiful symbolism that aloft towers the brown trunks like sturdy manhood, softened and ripened judgment is shown by the long grey beards and yet the vigor of youth springs upward in the waving leaves that reach toward the sky for Buddha's blessing. The elm, the pepper and the umbrella trees are excellent for avenue planting. The pepper is always graceful and attractive, while the elm arches over and completely interlocks in a few years—making a green tunnel to drive through. The elm is also endeared to many by the magnificent avenues of the collegiate intsitutions of New England. The grevillea is not a good avenue tree as it makes too much litter. The acacias are apt to be irregular in growth, so they do not make the avenue formal enough. The eucalyptus is so good that it seems a pity to say it is often a mistake to plant it, for it shades the roadway and in a wet winter prevents the ground from drying out. Where the place is small, fruit trees as the orange, lemon, fig, apricot and olive are used, if sprayed and cultivated with the same care the orchard receives, are good, but too often they are negelected and allowed to be covered with pests. The driveways are best used as paths and the spaces for planting not cut up into intricate masses, for walks must be kept in order and the expense of a walk will keep several flower beds.

* * *

Lawns are most pleasing when sweeping and not of regular outline. If the ground is irregular, soften off the abrupt places, but do not level it, or make into the shape of an inverted basin. An abomination commonly seen in California is having a straight entrance drive coming in and dividing into two parts, circling around the poor deformed lawn that is high in the center and slopes to the driveway on every side with the greatest regularity as though an immense pudding tied in a bag had been dumped down. While lawns, according to many landscape gardners should be free from trees and shrubs, it is not always possible in California, for in the interior valleys even Bermuda grass will sunburn if not shaded part of the day. Then the excessive amount of water required makes a little shading desirable. By studying the mountain meadows where large trees stand irregularly and the shrubbery hugs the sides, breaking into irregular lines the edges a good idea of natural lawn making is gained. Here the grasses creep lovingly to the foot of the largest trees.

* * *

The euclypts come first in the ornamental planting of a large place and the three great divisions are popularly known in Australia, the the stringy barks, the iron barks and the boxwoods. The stringy barks contain many that are lofty and graceful trees, but are not desirable close to the buildings as sparks often set the clinging bark on fire, and the flames will run up them like a torch, in a minute the tree is on fire in twenty or thirty places. Why do we negelect the oaks? They grow readily in nearly every part of the state and after they are once started, will grow as rapidly as the black walnut or the linden.

Now, the acacias. There ars at least a dozen varieties that are desirable for flowers and foliage, that every one should plant. The grevillea is useful in the background. Sycamore, walnut, buckeye and camphor trees and many others that would turn several papers as long as this into mere catalogues deserve to be mentioned.

* * *

Long lines of rose bushes following the curving entrance driveway are easily kept cultivated and if interspersed by palms, are agreeably diversified, if oleanders, crepe myrtles and other shrubs lead from them to the larger trees, the effect is natural. The roses are best left unshaded in the open ground, away from the large trees. The roses growing low, with the palms towering over them. These palms can have ivy, trumpet creeper and maderia vines clinging to them, adding to the picturesque wildness of the scene. Around the house it is desirable often to screen off at the back a place for ash barrels, clothes lines and the like necessary but not sightly uses. There are many desirable shrubs that can be massed so as to completely veil the background. Then there are hedges, that of Monterey cypress, though that dies badly in spots at times. The pivets are good and not at all common, while pomegranates in either the double flowering or the sweet fruited varieties are beautiful. Perahps after all the most beautiful screen is made of climbing vines on a high wire netting; the trumpet creepers, clematis, jessamine, honey suckles, have few pests and only need water to be thrifty. With these vines for a standby, try a few of the more fancy ones recommended by the florist. The briars including the old fashioned sweet one, with the lovely strains originated by Lord Penzance, when trained to wire netting are beautiful. The single and semi-double flowers so strongly appeal to the artistic sense that it is impossible not to take to water color sketching. The crimson rambler, when grown on a wire screen is at its best and fully justifies the seemingly extravagant laudations it has received. Grown in this way it is free from mildew, aphids and red spiders.

When the inexhaustible possibilities of country life crowd into the mind, how can we help exclaiming, the happiest woman on earth should be the farmer's wife, for she is the true home maker, for she can build her nest like a bird in a garden of flowers, with time to think and time to live. Society leaves one very empty, for the mature brain refuses to act when fed with prattle. All those met are mere acquaintances—for friendships are perfected only by time, and what are the shifting masses of people in the world compared to a friendship like that of Johnathan for David. Warm friends grow up among the flowers and often a few roses will express sympathy better than words.—Mrs. M. E. Sherman.

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

SPANISH CHESTNUT.

W. J. G., Claremont, asks if the chestnut so often recommended by the writer is the Japanese species.

It is not. It is variously known as Spanish, Italian, French or European chestnut (Castanea sativa). It is a larger tree, has a larger leaf and bears a better flavored nut than the Japanese species (C. crenata). The only point in favor of the latter is that it bears at a much lesser age.

The same correspondent wishes an erect, compact growing, flowering shrub, twenty to thirty feet high, of the habit of the Irish Juniper.

There are few flowering shrubs of such habit, though the Spanish broom (Spartium junceum) comes as near to it as anything that is really desirable. The columnar varieties of Juniper, Yew, or Cypress are by far the best if a narrow, upright growth is desired. Of these the Irish Yew is the finest in appearance, though slowest of growth.

SNAPDRAGONS.

Few who know the snapdragon of a dozen years ago would readily recognize some of the latest improved sorts as being of the same species, so much have they been improved. Both the spike and the individual flower have been greatly improved in size and form, and as for color, they run from pure white through the pinks and on to the deepest crimson, while others are shades of yellow and of purple. One strain of seeds give a majority of the flowers beautifully variegated. You may buy them in separate colors in any large seed store and now is a good time to plant them. If you find some colors that you fancy very much, they are easily propagated from cuttings in sand. Cuttings for this purpose should be the soft new tips, though not those which show flower buds. Snapdragons do well in California except where an occasional plant is attacked by a peculiar rust for which there is no remedy but to pull the plant out.

"Only a flower nodding;
A lowly thing indeed,
Only a breath of heaven,
Grown from a flower seed."

For plants to make the most rapid growth, the soil must be kept in such condition as will allow of the plant to most readily send its rootlets through the soil to assimilate their food; keeping the soil pure and mellow by cultivation is the only known, and commonly practiced method of accomplishing this result. Plants cannot grow without food, and the food must be in such shape that they can reach and assimilate it.

The Glendale Improvement Association meets the first Thursday night in November and Mr. Ernest Braunton will address it on "Street and Ornamental Trees."

The school children of Kansas City were, last and this year, encouraged to raise flowers under the direction of the Woman's Auxiliary of the Manufacturers' Association. It was a success and now they are receiving liberal pin-money from the sale of seeds.

The recent Florida tornado is reported to have distroyed 25 per cent. of the fruit crop in that state.

Ontario has organized a chamber of commerce.

A LARGE INCOME FROM ROSES.

A large income in roses is attained by the octogenarian dean of Rochester in England, who spends his spare moments in the cultivation of this beautiful flower. A London dispatch to the Philadelphia Public Ledger says, in referring to the venerable dean: "Combining deep learning with a large fund of deep wit and broad humor, he can spare time from his heavy ecclesiastical duties to add $5000 a year to his income by growing roses in the musty old town so well known to the lovers of Dickens. For sixty years the dean has been studying the national flower, and during that time as many as 300 varieties have passed through his hands. He is his own gardener, even at his present advanced age, and it is only the more laborious part of the work that he intrusts to other hands. As early as 7 o'clock in the morning the dean may be seen in the garden looking after his pets. His method of disposing of his roses is through a London wholesale florist, who cuts them at Rochester under the critical eye of the dean and removes them to Covent Garden market, where they are sold at prodigious rates to west end clubs and restaurants. Many of the varieties are so rare that it is no uncommon thing for a single rose to fetch as much as $2."

BULBS AT WORLD'S FAIR FILL 16 ACRES.

Fifty thousand cannas, with their gorgeous array of colors; great caladiums, with their mammoth foliage; modest dahlias, with their dainty colored petals, and beds of tuberoses, with their wax-like flowers and intense fragrance, combine to make a floral exhibit that will cover sixteen acres of ground on the World's Fair site at St. Louis.

A North Carolina company furnished the bulbs for this display and Joseph H. Hadkinson, superintendent of outdoor planting for the Department of Horticulture, has charge of the installation. The plants will not be seen in one mammoth bed or tract, but will be scattered in well modeled groups over the northern and eastern slopes of Agricultural Hill.

The tuberose bulbs will be so selected and planted that commencing with the early summer there will be a profusion of blossoms, and fresh supplies will constantly succeed one another until frost comes. The caladiums are grown mainly for their foliage. A large group of these almost tropical plants will be at the corner of the terrace 10 feet high and a quarter or a mile long that skirts the mammoth palace of agriculture on the eastern side.

That the dahlia may no longer be considered a "back-yard" flower will be demonstrated by the prominent position alloted to it in the World's Fair garden, by far the largest and most pretentious ever seen at any international exposition.—Florists' Exchange.

PENNISETUM SEED.

Editor Cultivator:—Can you inform me where I can buy seed enough of pennisetum, (the new cattle food) to plant half an acre, kind of soil best adapted to it and the price of seed per pound.—F. T. B., Windsor, Cal.

Any seed house which advertises in the Cultivator will furnish you the seed or procure it for you.

PROSPERITY OF ARROYO GRANDE.

Editor Cultivator: This valley is in a very prosperous condition. Fruit of all kinds have yielded good returns, and the apple crop now being gathered is large and the fruit of fine quality. The beet crop is large and the percentage in sugar high. The bean crop is not up to the average in quantity owing to unusually hot weather when the beans were green. Large quantities of grain pass here daily from the southern portion of the county, bound for Port Harford, taxing the hauling capacity of the P. C. R. R. Hay is not abundant but there is sufficient for home use. All things considered the farmers around Arroyo Grande are well satisfied with the year's returns.

The Cultivator retains its popularity here and is gaining friends all the time.

Kindness to animals is more than kindness; it is justice.

$10 to $42.50.

Fall Suits, $10 to $40

Mail orders carefully filled. Self-Measurement Blanks free upon application.

Mullen & Bluett Clothing Co.

First and Spring, Los Angeles

The annual transportation scare is on again, and shippers of beans, nuts, dried fruits and other commodities, are wondering where they are to get cars to transport their products to market. The railroads have at times experienced great difficulty in handling California fruits during the rush of the season, but this year there is promise of enough cars to handle the business of the state.

The Santa Maria Times thinks that the walnut crop will be almost an average and prices will be better than they have ever been.

The market on apricots and peaches was a little stronger this week.

A comparison has been made of the prices received by the California prune growers at 2¾ cents per pound, and those obtained by French prune growers at the prices they sold at this year. The table was prepared by the San Jose Mercury and is as follows:

Per Ton of 2000 Pounds.

	French.	California
50 to 60	$280.20	$80.00
60 to 70	244.80	70.00
60 to 70	2[illegible].80	70 00
70 to 80	203.04	60.00
80 to 90	168.06	50.00
90 to 100	150.08	40.00

Los Angeles Markets.

Los Angeles, Cal., Oct. 22.

The local produce markets have maintained a steady figure all the week. There has been little change in prices and there seems none in sight. Butter and eggs are firm. Good potatoes command firm prices. Dried fruits and nuts active. Apples and grapes in active demand. Poultry wanted. Hay and grain firm.

San Francisco Markets.

Dairy.

San Francisco, Nov. 21, 1903.

The week has been signalized by a steady tone in the butter market. Better grades of Creamery have commanded stiff prices, but the cheaper article has proved disappointing. Trading in cheap butter was slow all the week and prices were sluggish.

BUTTER—Per lb:

Creamery, extras	.29 @30
Creamery, good to fancy	.26 @28
Dairy extras	.24 @25
Dairy choice	.22 @23
Store	.18 @20
California Storage	.24 @27
Eastern Creamery	.23 @25

CHEESE—Per lb:

Cal. Creamery, mild new, extra	.14 @15
Cal. Creamery, mild new, choice	.13½@14
Young America	.14 15½
Eastern, New York Cream, Cheddars and flats, new	.14½@16

Eggs and Poultry.

The light arrivals of Ranch Eggs and the briskness of the demand caused a further improvement in the demand and a 2 point advance was effective in values for selected offerings. Storage Eggs naturally shared in the improvement and there was a general hardening of values for both local and Eastern descriptions.

EGGS—Per doz:

Ranch, selected large	.52 @53
Ranch, good to choice	.45 @50
Store	Nominal
California storage	.30 @33
Eastern	.25 @30

Trade in the Poultry market continued slow most of the week and the general tone leaned toward easiness at the prevailing prices. Fat Hens, large Young Turkeys and Young Pigeons were the favored descriptions in local stock and brought up to the top quotations when sales were effected.

POULTRY—Old Roosters, per doz, $4.50@5; young Roosters, $4.50@5; Fryers, $3.50@3; Broilers, large, $3@3.50; small, $2.50@4; Hens, small, $4@5; large, $5.50@6; Ducks, per doz, old, $4.50@5; young, $5@6; Turkeys, young, per lb., 19@22c; old, 14@17c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz., young, $2@2.25; do, old, $1@1.25.

Fruits and Vegetables.

No great change marked the quotations in this department during the week. Deciduous fruits showed a pretty firm market basis and prices were generally well maintained.

APPLES—Per box, common to choice, 25@85c; fancy, $1@1.25.

PEACHES—Per box, nominal.

PEARS—Per box. Winter Nellis, $1@1.25; other varieties, per box, 35@75c.

PLUMS—Coe's late red, pr box or crate, 40@65c.

FIGS—Per box, nominal.

CANTALOUPES—Per crate, $1@1.50.

NUTMEG MELONS—Per box, 65@90c.

WATERMELONS—Each, 5@15c.

POMEGRANATES—Per box, 65@2.50 as to size of box.

PERSIMMONS—Per box, 75c@$1.

QUINCES—Per box, 40@65c.

BERRIES—Per chest: Strawberries, Longworth, $6@10; large varieties, $1.50@6; Raspberries, $4@6; Huckleberris, per lb, 7@8c; Cranberries, per bbl., Cape Cod, $9.50; Oregon, per box, $2.50@3.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal; Valencias, $1@2.50; Lemons, $1@3; extra, $3.50; Grape Fruit, $1.50@2.50; Limes, $4@4.50.

There was no special change in the market for vegetables, Potatoes showing no particular demand. The market may be classed easy and prices nominal.

VEGETABLES—Tomatoes, per box, 25@50c; Green Peppers, per box, Bell, 50@75c; Chile, 40@50c; String Beans, per lb., 2@2½c; Wax, 3@4c; Lima, per lb., 2½@3½c; Green Peas, per lb., 2½@3½c; Egg Plant, per box, 40@60c; Summer Squash, per box, 35@50c; Cucumbers, per box, 35@50c; Garlic, per lb, 3@4c; Okra, per box, 75@90c; Marrowfat Squash, per ton, $10@$12.50.

ONIONS—Yellow, pr ctl., 80@85c.

POTATOES—Per ctl: River Burbanks, 50c@75c; Earl Rose, nominal; River Rds, 65@75c; Salinas Burbanks, $1.25@1.45; Oregon Burbanks, 75@85c; Sweet Potatoes, $1.25.

Dried Fruits, Nuts, Etc.

Interest in Dried Fruits at present is less keen than a week ago, but as supplies of the leading descriptions are well concentrated in strong hands the market continues on a firm basis at previous prices. The decline in Raisins was generally welcomed by buyers, and dealers are now busily engaged in making refund to large jobbers.

DRIE DFRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 5@6c; Sun Dried, 3½@4c.

Apricots—Royal, fancy, 9½@10c; choice, 8@8½c; Moorparks, choice, 10@12c.

Peaches—Choice, 5¼@6½c; fancy, 8½@9c. peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Black, 4@4½c.

NUTS—Per lb: California Almonds, hard shells, 8@8½c; soft shells, 8@8½c; soft shells, 10@11c; paper shells, 11@12c; standard, 9@9¾c;

Pecans, 11@13c;Pinenuts, nominal; Peanuts, Eastern, 6@6½c; do, California, nominal; Brazil, 10@11c; Filbert, 10@11c; California Walnuts, soft shells, No. 1, 13½c; do, No. 2, 11c; hard shell No. 1, 13c; do, No. 2, 11c; Hickory, nominal;; Chestnut, California, 10@15c; Cocoanuts, $4.50@5 per hundred.

Live Stock.

San Francisco Chronicle says: Supplies of Cows and Heifers continue liberal but, under the reduced prices, the movement is of larger volume and the market is less depressed. Hogs are in increased supply, and, in sympahty with the easier market for Pork Products, are quoted weaker. Prices, however, show no change, but the outside rate is an extreme for the best offerings. Other Live Stock is in steady demand at former prices.

CATTLE—No. 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6½@7c; No. 1 Cows, and Heifers, 6½@7c; second quality, 6@6½c; thin Cows and Heifers, 4½@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½@4c, gross weight; Ewes, No. 1, 3¼@3¾c, gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb., live weight.

HOGS—Per lb: Hard grain fed, weighing alive 140 lbs. and over, 5½@5¾c; weighing under 130 lbs, 5¼@5½c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

FRESH MEATS.

Business in the market for Fresh Meats was purely of a routine character yesterday, but as supplies were not excessive the appearing prices were well sustained and first quality offerings sold well up to the maximum figures. Values for Mutton and Lamb show a fractional decline.

BEEF—Per lb: No. 1 Steers, 7@7¼c; do, second quality, 6½@6¾c; No. 1 heavy, 7@7¼c; thin, 6@6½c; No. 1 Cows and Heifers, 6@6½c; second quality, 5½@6c; thin, 4@5c.

VEAL—Per lb: Heavy, 6½@7c; light, 86c@9½c; poor Calves, 6@6½c.

MUTTON—Per lb: Light Wethers, 8@8½c; do, Ewes, 7½@8c; heavy Wethers, 8c; Ewes, 7@7½c.

SPRING LAMB—Per lb., 8½@9½c.

DRESSED HOGGS—Per lb., 8½c.

Retail quotations for Meats, as furnished by the San Francisco Retail Butchers' Protective Asociation, are as follows:

BEEF—Prime Roast, 15@18c; Porterhouse Steak, 18@22½c; Tenderloin Steak, 15@18c; Sirloin Steak, 12½@15c; Top Round Steak, 12½c; Beef Stew, 10c; Corned Beef, 8@10c, Soup Meat, 4@10c.

MUTTON—Leg, 15c; shoulder, 10@11c; Stew, 8@10c; Prime chops, 12½@20c.

SPRING LAMB—Chops, 25c; Hindquarter, $1.25@1.50;; Forequarter, $1@1.25.

PORK—Loin Roast, 15@18c; Leg Roast, 12½@14c; Shoulder Roast, 10@12½c; Chops, 15@18c.

VEAL—Loin Roast, 15@20c; Shoulder Roast, 12½@15c; Chops or Cutlets, 15@20c; Stew, 12½@15c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13@$16.50; Wheat and Oat, $13@15.50; Oat, $11.50@14.50; Barley, $10@13; Clover, $9.50@$11; Alfalfa, $9.50@12; Stock, $8.50@10.50.

STRAW—Good to choice, per bale, 55@65c.

FEED CORN MEAL—Choice grades, per ton, $30@31.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@29.

BRAN—Per ton, $22@23.

CRACKED CORN—Choice quality, per ton, $30.50@$31.50.

OIL CAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BEANS—Prices per ctl: Large Whites, $2.50@2.85; small do, $3@3.25; Red, $2.90@3; Pink, $2.40@2.70; Bayo, $2.35@2.65; Blackeyes, $2.25@2.65; Red Kidneys, $4.25; Limas, $3.05@$3.20.

Hops.

The price for new crop is 20@22½c, according to quality.

Wool.

Fall clip, per lb.: California, Plains, 8@10c; Foothills, 10@12c; Middle Country, 11@13c; San Joaquin Lambs', 9@11c; Northern Free 11@12c; do, Defective, 10@11c; Humboldt and Mendocino, 1214c; Nevada, 13@15c; Oregon, 17@19c.

Eastern Markets.

Grain and Produce.

CHICAGO, October 21.—There was good demand from commission houses for both December and May Wheat, early in the session, and with offerings quite light the market took on a strong tone, December advancing to 81 after opening a shade to ⅜ higher, at 80@80⅝.

The leading futures closed as follows:

	Closing.
Wheat, No. 2—	
December (new)	80⅛
May	78⅝
Corn, No. 2—	
October	43½
December	43¾
May	42½
Oats, No. 2—	
October	35⅝
December	35⅝
May	36¼

Cash quotations were as follows: Flour was steady; No. 3 Spring Wheat, 84; No. 2 Red, 81½@82; No. 2 Corn, 43¾; No. 2 Yellow, 44¾@45½; No. 2 Oats, 45⅝; No. 3 White, 35@37½; No. 2 Rye, 56½; good Feeding Barley, 43@44; fair to choice malting, 47@54; No. 1 Flax Seed, 93½; No. 1 Northwestern, $1.00; Mess Pork, per bbl., $11.10@11.12½; Lard, per 100 lbs., $6.50@6.55; Short Ribs, sides (loose), $7.50@$7.55; Clover, contract grade, $10.75.

Grain Movements.

California Dried Fruits.

NEW YORK, October 21.—The market for evaporated apples was firm for futures, with November-December delivery quoted at 5⅝@5¾. Spot supplies of new fruit are in light compass and values uncertain. Common are quoted at 4@5½; prime at 5¾@6; choice at 6@6½, and fancy, 6¾@7. Spot prunes remain quiet. Quotations range from 3½@7 for all grades. Apricots are meeting with a little better demand, and rule steady. Choice are quoted at 10@10½, and fancy at 11@12½. Peaches quiet. Choice are quoted at 7¼@7¾; extra choice at 7¾@8½, and fancy at 9¼@10¼.

CITRUS MARKETS

NEW YORK MARKET.

One interesting feature of the fruit market this week has been the arrival of the first California crop of oranges for the season. They were large and fairly well colored. They sold readily at $5.00 per box.

Offerings have been light so far this week, owing to the desire for new oranges. Four carloads came in on Tuesday and sold quickly.

Some Florida oranges are now coming in, but they are green and not wanted. Regular receipts are expected about November 1. The quality of the crop is reported fine, and later advices say the crop will be 1,700,000 boxes, being 75 per cent. larger than last year. Growers are said to intend holding back until the fruit is fully matured.

No California lemons have arrived in some weeks and none are reported received this season The foreign lemons are in small supply and the market is very strong, though it is mostly local.

Carload shipments of citrus fruits from Southern California to eastern points, the season beginning November 1, 1902: 22,298.

RAISIN CROP.

Rufus Lane, U. S. Consul, Smyrna, reports a decline in prices. Arrivals up to date 13,000 tons, of which 10,000 have been sold. Sultanas have been damaged by rain, which is the principal cause of the probable decline in prices. Red and Black raisins are fairly large and not much damaged. On them there will probably be no decline in prices.

SUMMONS.
No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 14 day of Sept., A. D. 1903.

C. G. KEYES, Clerk.
(Seal) By C. O. Winters, Deputy Clerk.

Griffiths, Munson Briquette Co.

TELEPHONES { MAIN 806 / HOME 806

Office, 128 Hellman Blk. Works, Atlantic St. and Santa Fe Tracks

Los Angeles, California

Orchard Briquettes are in size 12 inches by 6 inches and 5 inches in thickness, weighing about 9 pounds each. They are to be burned in the orchard on the ground, requiring nothing to contain them, and being entirely consumed unless intentionally extinguished. Two or three are inclined towards each other, forming a pyramid, leaving free vent beneath for air passage, at which point the torch should be applied. No kindling is required. It will burn long enough to meet the requirements of the usual cold night. In orchards where some degree of protection is afforded by wind breaks or trees being large and close together, two Briquettes are used to the fire, twenty-five fires to the acre, one ton being sufficient to protect four acres for one night. In open and more exposed groves we suggest using three Briquettes to the fire or one ton to three acres for one night's fires. It is best to use the extra Briquette on the first two rows of fire on the exposed side of the grove.

Briquettes are impervious to water; and when placed in position where they are to be burned if it should rain, the Briquettes shed the rain and are in condition to light at any time, and burn as freely as if not rained on. They should not be exposed to hot sun.

Price $12 a ton f. o. b. Los Angeles. Present freight rate same as coal. We hope to have a lower rate based on rate for fertilizers made, and are working for same.

SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

**NO SMUT
SIMPLE AND
EFFECTIVE**

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees' I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is healthy, with fine flavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

Coulson's Egg Food

What It Is and What It Is Good For

It Makes Hens Lay Eggs When Eggs Are High

Times are getting so that the poultry business is like every other business. The man who doesn't understand his business will fail, and the poultryman who is not willing to learn how to make his hens lay will either fail or have a very poor living if he has to depend upon his hens to keep him. If one expects his hens

to lay well they should be fed well; that is, the right kind of feed, the feed that the hens can easily digest and turn into eggs. Every egg contains exactly the same kind of material, and the nearer we furnish the hen with exactly the right material in the right proportion and fix it so that it is easily digested, the more eggs the hens are likely to lay. Thousands of hens have little eggs of which only a few are laid because they do not have the proper food. Some things used in making Coulson's Balanced Ration Egg Food are: Best heavy oats ground into meal. These are then bolted over screens to get out as much of the hulls as possible (these hulls are sold for cow feed.) The fine oat meal makes the best kind of feed for eggs. Also use ground Chevalier barley, known as beardless barley. Also shorts and middlings, pea meal, cottonseed meal, pure flax seed meal, fresh raw ground bone, pure deodorized, dried beef blood ground fine, fine hen's teeth, granulated charred bone, powdered willow charcoal, and a little red pepper, ground ginger root, ground Foenugreek seed, iron tonic, etc. All weighed out in the right proportions and thoroughly mixed together ready to feed. All you have to do is to stir up with water and give a little green stuff of some kind.

This is a very rich mash food and it is only necessary to feed it once a day, either in the morning or at noon, and at night feed whole grain.

There is some fine grit mixed with this food to keep the hens from eating it too fast and to help digest it. This is certainly one of the very best rations for egg production and the cost is not much.

One of our customers has about 2400 hens. He feeds them twice a day only. One meal in the morning he gives them all they will eat of Coulson's egg food and at night he feeds them whole grain. 140 pounds of Coulson's Egg Food is all it takes to feed these 2400 hens. 140 pounds of this food costs about $2.75; so the cost is less than 15 cents a hundred to feed the hens all they can eat of it for one-half a day's rations. The egg production of this flock has increased an extra 300 dozen of eggs this month.

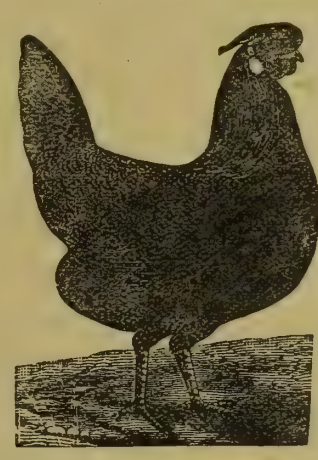
Another man has 600 hens and 100 pounds of this food lasts four days, and the hens have a full meal of it once a day. This man feeds three meals a day but for the one meal of Coulson's Egg Food the cost is less than nine cents for 100 fowls.

A hen cannot eat as much in weight of Coulson's Egg Food as she would of ordinary food, because Coulson's Egg Food is so rich and more substantial and so it is really cheaper than any other kind of food that you can feed.

And the hens will be healthier and produce more eggs during the year. Remember this feed is so rich that it

is only necessary to feed it as a mash once a day.

Nothing venture, nothing gain! Don't be afraid to try it. You have to buy some kind of food and a few cents more spent on a sack of good rich food



may make your hens lay a great many more eggs.

Now, when you start feeding this food, please stick to it for at least two months, and by that time you will be convinced that it is the best food for egg production. Many of our customers started feeding the food last fall and kept it up. Their hens laid well all winter, some hens averaging five eggs a week each. One flock of 200 hens laid from 8 to 10 dozen eggs a day. Another flock of 500 hens laid 200 eggs a day through the winter season.

Give the hens a little help if you want the hens to help you by laying lots of eggs, why not help them a little by giving them good, rich food like Coulson's Egg Food?

One meal a day of Coulson's Egg Food well be a great help to the hens because it will furnish them with a lot of good egg-making material.

You can produce eggs for 12 cents a dozen by feeding Coulson's Egg Food, and you can sell them for 45 cents a dozen. The more eggs the more money you will have.

A hen is simply a machine. Keep her in good order and feed her properly and she will make you a profit of more than a dollar a year for each hen properly managed. Better get a ton of this food right away and get the hens down to business.

A ton of this food will cost you $33, f. o. b. Petaluma, and it contains more egg-making material than forty dollars worth of cheap feed.

Cheaper to steady customers.

200 tons a month now being used.

The price of this food at Los Angeles is $2.25; in Santa Cruz is $2 a sack; Sacramento and San Jose, $1.85 a sack; Oakland, Santa Rosa and surrounding towns, $1.75 a sack; in Petaluma, 5 sack lots, $1.55 a sack. If you are living at a distance and your feed dealer hasn't got it, write to us and we will send it by freight.

Feed Coulson's Balanced Ration Egg Food and your hens will lay. It pays others to feed it! Commence now and fed the hens Coulson's Egg Food, 175 eggs a year from each hen. It beats all how it makes hens lay.

MIDLAND POULTRY FEED

Will make your fowls moult in one-half the time, which means they will lay that much sooner. "Laying fowls are paying fowls." You will not be disappointed at the results you get from feeding Midland Feed.

No. 4, Egg and Feather Producing Food

Is what you should feed your hens now, and the results you get will surprise you, for we know it will prove a paying investment. Our book, "The Science of Poultry Feeding," will tell you more about this feed. Send for it. It is FREE. Also

No. 1, Nursery Chick Food
No. 2, Growing Chick Food

We will be pleased to give you further information about this feed if you wish it. WRITE FOR PRICES.

The Only Reliable Balanced Ration for Poultry in the World.

These special foods are composed of the very best materials obtainable and as carefully and accurately mixed as it is possible to make them. They are a COMPLETE FOOD and will produce specific results, each for its purpose, and no other. We want you to become an established customer of ours. We want your trade, be it little or much. There is only one way we can secure it and that is by sending you material that will do what we claim for it.

The Midland Feed will cost you very little more than any good grain you now feed, and no more than you now expend for all the extras you must use in addition to your grain, and the results will be so far in excess of any previous experience you have had that you will readily acknowledge its value.

What the poultry man must be able to count on to a certainty is RESULTS.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 18 LOS ANGELES, CAL., FRIDAY, OCTOBER 30, 1903 Subscription $1 a Year

. . . Dairy Farming in California . . .

MRS. M. E. SHERMAN, FRESNO

Butter and cheese making are fully discussed from the creamery standpoint at the dairy associations and the butter makers conventions; to the enlightenment of those having a large amount of milk to handle. Yet how little help is there found in these able papers contributed for the woman struggling to make gilt edge butter from the milk of one or two cows, and with the limited appliances usual to the farm.

I was totally ignorant of the working side of country life when we moved to the ranch, just a shade less ignorant than the Bostonese who went to a farmer, to buy three kinds of cows, one to give milk, one to give cream and one to give butter milk. The incentive that compelled the taking-up of butter making, was having a family of invalids, that could not eat the store butter or even endure its odor on the table. The standard to reach was the highest, for in the old Philadelphia home, the Darlington or Sharples butters had been used. These old Quaker families produced a butter that is their pride, and is nearly faultless in flavor and grain; and when on the table the delicious aroma or boquet prevades the room with an appetizing odor. At last, the value of aroma, as indicating the highest quality has been recognized and at the coming St. Louis Purchase Exhibition, in the scoring of butter, aroma will be allowed 15 points, and better yet, the leaders in the creamery world are admitting that it is the correct way of scoring. We have heard of butter receiving a first award, that in 24 hours was rancid. This injustice to other exhibitors of butter could not have occurred had the aroma been scored as well as flavor and grain. It is always to be deplored, when a low standard is established for any staple article like butter.

Milk is in itself a complete food, containing all the human family needs to support life and health. It is extremely nutritious when diluted with water, and suggests that the dietary error of the day lies in the use of concentrated foods and the cereals that are burdened with starch, while Nature's broad hint that a perfect food is not concentrated, and not starchy, but contains plenty of water to aid elimination of the undigested portion, goes unrecognized. Milk is the most valuable food that we can put on the table, for family use, and we farmers can have it, fresh and sweet for our daily living. The water contents of milk make it an excellent culture medium for bacterial growths, both good and bad, the necessary good ones can be retained, and by cleanliness in handling the bad ones kept at bay; for if any success is to be achieved in butter or cheese making, absolute cleanliness must be observed in every part of the work. Slovenly, careless people may do to raise pigs, but are out of place in the society of my lady, the cow.

When one or two cows are kept, the milking is usually done by the hired man. It would be better if some one of the family did the milking, as then the hours would be more regular, as a rule, it is not possible to have the hired man as neat, or make him see the necessity for clean clothes, before entering the cow lot. If the children do the milking, the cows become very gentle and great pets. It is a good thing for the children to have pets that are useful and to have work to do that counts for a part of the family living.

Have a corner fenced off to milk in, where there is not a barn or stall, at least, and if the ground will harden under water, wet it down or else have a few planks for the cow to stand on, that can be kept clean. The cows should be brushed off before coming into the milking place. It helps to keep the cows clean, if the hair on the hips and shoulder is closely clipped. In brushing off a cow, use a common broom, cutting off about four inches of the whisp part and shortening the handle to a convenient length. The brushing can be done in five minutes. The udder is then wiped off with a clean cloth, the time spent is fully repaid, in the greater ease with which perfect butter and cheese is made. A covered milk pail is desirable, but if not convenient to buy one, a flat bottomed tin wash basin can be used, it must be large enough to cover the entire top of the pail, and have a two-inch strainer soldered into the bottom, by milking through this, the newly drawn milk is strained into the pail. The cover pail is, however, better if the cow is at all restive, as it can be moved away more quickly. Blue and white check aprons made very full and a pair of sleeves complete the milking clothes. It is little trouble to wash these out and use them rough dried. The particles of scurf from the body of the cow as well as the particles of manure clinging to any part of the milker are kept out of the milk. When there is only one cow to feed, she usually has grass for her diet with hay, a little bran and perhaps some rolled barley. It is surprising how much of the waste from the family table can add to the variety of her menu. If the vegetables are carefully washed the potato parings, the clippings from the vegetables cabbage leaves, with dry bread and remains of the cereal foods left from the breakfast table, everything except grease, meat scraps and tea and coffee grounds can be given to her. some cows are fond of the clabbered milk and of buttermilk. The milk room may be merely an airy closet, but it must be used for milk only, not open off the kitchen where odors arise from the cooking. The

THE WEEK.

Crisis in the Orient.—Again the war cloud seems drifting away from the East. Russia and Japan appear to have come to a common sense view of their respective conditions and war is averted—at least for a time. Amicable compromise seems likely to take the place of war. It can not be told just how far this intention will go, for we do not know how honest Russia is in her apparent desire to keep the peace. However the longer open hostilities are averted the more remote are the possibilities for trouble. Nations, like individuals, need time to cool down from anger or excitement and often a second thought entirely changes the nature of affairs. Let us hope the cycle of "belligerency" in which our planet is now revolving will be passed soon, and our round old earth slide back into its time-honored groove of harmony and good will.

* * *

Senators Go Wrong.—Scandals in high places are threatened in connection with land frauds that are being investigated by the Secretary of the Interior. A high official of the Interior Department says that the investigation now proceeding will reveal a condition of affairs far more astounding than was discovered in the Postoffice investigation, and that instead of a lot of minor bureau officials being caught, several men of national importance will be involved in gigantic public-land deals. The names of no fewer than six United States Senators are mentioned today as being implicated in the various great deals in timber lands on the Pacific Slope and the Far West. In addition, the names of state officials of various states are being mentioned as men likely to be indicted for frauds and the names of some important members of the House of Representatives are included in the list. When one thinks of the corruption witnessed by men in high places he cannot help asking the question which the long suffering politician from the South once asked President Cleveland, viz.: "Where are we at?"

* * *

Judge Estee Dies.—One of the best known and honored Californians has been called from the scene of his earthly activity by death this week. For more than 30 years Judge Estee has been a prominent figure in the public affairs of his state. He was a thoroughly representative man, for not only had he been a farmer, a miner, and a lawyer, but he was a horticulturist and a viticulturist. He was a member of the Pan-American Congress. His services were recognized June 2, 1900, by appointment as the first Federal Judge of Hawaii, which position he held at the time of his death.

* * *

President Diaz.—The assassin's bullet sped thick and fast about the person of Mexico's able president, as a noted criminal attempted the life of this honored man. Fortunately the missles of death went wide of their mark and Diaz still lives.

* * *

Intelligent Service of God and State—The President of the United States on Sunday last, delivered an address before 7000 people in Washington, at a missionary service, which is quite out of the ordinary for men occupying his position. It still further emphasized the christian spirit which this strong man has developed in his public utterances and has still closer linked his life and career with the great Republic whose servant he is. The argument he advanced with so much power was the need of civic righteousness in the citizen. "The chance to do work, the duty to do work, is not a penalty but a privilege," said he. This declaration made at a time when it is believed we are approaching a crisis in our nation's' history—a crisis between labor and capital—is the more worthy of consideration because it comes from one who understands the gravity of the situation, and who knows that between these conflicting elements there must come harmony somehow, or the country witness irreparable and widespread ruin. The thoughtful reader will recognize the point at which the President aims in the entire address. It is a fair chance to be a good citizen, unrestricted by conditions which tend to destroy the ability of the man to make of himself all he honestly can. "The best constitution that the wit of man has ever devised; the best institutions that the ablest statesman in the world have ever reduced to practice by law or custom, shall be of no avail if they are not vivified by the spirit which makes a state great by making it honest, just and brave.

"If you have not honesty in the average citizen or public servant, then all else goes for nothing. Not only the honesty that keeps its skirts technically clear, but the honesty that is such in the spirit as well as the letter of the law; the honesty that is aggressive; the honesty that not merely deplores but that wars against it and tramples it under foot. I ask for that type of honesty."

These are indeed ringing words that fall with wondrous effect upon the public ear in these times of social and financial unrest and when, in both public and private life the disposition to be dishonest is so painfully apparent.

* * *

Canada Disturbed—The decision reached in the boundry contention by the American and British commission has stirred the ire of our northern cousins to fever heat, so bitter is their feeling of opposition to the finding of the court that they now propose to cut off the tax they have annually paid England to assit in maintaining the war footing of that power. To read the editorials in the Toronto and Quebec newspapers one will be taken back in history to the times before the revolutionary war, when our forefathers, aggrieved at the tyranny of the mother country, resolved to become an independent nation. Really Canada is getting up to a point of open rebellion—if this thing goes on and we may possibly see another conflict on the Western continent and a new sovereign power on the north of us. But, of course, this is a remote possibility—for left to herself the query arises, can Canada maintain a government "all her own" when, at present, her greatest ability seems to be manifested in augmenting, rather than decreasing, her public debt.

* * *

Colombia Again.—News comes from Panama that a revolution has broken out in that little country, the cause of which no one seems to have a clear idea. For several weeks there have been rumors of an approaching revolutionary movement in Colombia. The political horizon of the country is clouded and there are many signs of unrest arising probably from the discussion and opposition to the canal project and approaching presidential campaign and the heavy deficit in the treasury.

Just how far this movement will extend is a subject for speculation. The outbreak does not appear to have the support of the Liberals in Panama, and without it, it will be difficult to make it very dangerous or formidable. But Colombia has before shown that a small spark can create a big fire, and it may be this is to be another instance of what a small revolution may grow into.

* * *

Road Making.—The Cultivator is glad to note the interest the Woman's clubs in California are taking in road making. In the northern part of the state in particular, much activity prevails, and the result from woman's work is apparent to a marked degree. These women are practical, and up-to-date, and in addition to their household duties and their club work they are imbuing their husbands with energy born of poetry. As they go about their daily duties they may be heard to sing:

"In this world's broad field of battle
Where each one must bear his load,
Be not like dumb, driven cattle,
Get a hoe and fix the road—"

* * *

Division of Citrus Fruit Business.—Judge Wellborn of the U. S. District Court has issued an order to the agent of the Southern Pacific Railroad Company to bring into court certain documents which the Interstate Commerce Commission desires information upon.

The evidence wanted is the so-called percentage table, which shows the agreement existing among the several initial lines for a division of the citrus fruit shipments out of local territory. This evidence, it is claimed, will be very valuable to fruit shippers in this territory.

* * *

Among the estimates for deep water improvements to be submitted to congress are two in California: San Pedro, $500,000; Wilmington, $50,000.

Santa Barbara, also ought to come in for a small appropriation, at least sufficient to erect a deep water wharf that will admit sea carrying vessels to land if they desire to.

* * *

The fate which follows notoriety has come to Mrs. W. J. Bryan. An enthusiastic admirer of her husband has left $50,000 to the family, but the wife of the benefactor refuses to have the will construed as it is written. As Mrs. Bryan is one of the executors of the will it is charged that she influenced the maker to remember her family. It all came about by the Bryans staying with the Bennetts when Mr. Bryan was hustling for the presidential chair. Such is the fate of publicity.

Individual fruit growers are writing to the State Board of Trade commending the resolution adopted by the board to provide for an investigation relative to the returns that California farmers receive for their products in the markets.

The Pacific Redwood Shingle Company has raised the price of redwood shingles from $1.45 to $1.65 per 1000. Prices were cut recently from $1.80 to $1.45 on the prospect of a fight with some rival mills but peace is now said to have been patched up.

The great George K. Porter ranch, comprising 16,450 acres in the San Fernando valley, has been bought by a syndicate of Los Angeles developers, for $575,750. This is at the rate of $35 per acre. The ranch lies about sitxeen miles northwest of this city. It comprises the north half of the San Fernando valley, and includes the town of San Fernando, on the main line of the Southern Pacific railroad, and some of the finest fruit and farming lands to be found in this portion of the state.

Manager Briggs of the State Board of Trade has prepared a letter to be sent to growers and organizations throughout the state asking then to co-operate, and suggesting ways in which they can render invaluable assistance. Work is also being done in preparation for a systematic investigation of the subject both in this state and in the eastern markets to get at the causes of present conditions, and particularly to provide a remedy.

A. Sbarboro, chairman of the California Promotion Committee today announced that the American Grape Acid Association, which was formed for the purpose of discovering a formula for making cream of tartar from grapes, and which has offered a prize of $25,000 to the discoverer of such process, will make a suitable reward for a solution by which grape juice can be utilized in making syrup.

The Department of Agriculture has for several years been experimenting to determine the dietary of different foods. The report is that nuts and fruits will sustain even those who labor as well as meat, and such diet costs from 15 to 18 cents per day, while animal foods containing an equal amount of protein, will cost 26 to 30 cents. Prof. Jaffa, who made the experiment, says nuts are the cheapest source of energy for the frutarian, the peanut ranging far ahead of any other variety. Dried beans, however, supplied more protein than the peanut.

An appeal has just been issued to the users of tobacco in Germany to boycott the American tobacco trust.

..General Agriculture..

WILL HANDLE ITS OWN FRUIT.

The Independent Placentia Fruit Company, the recently perfected independent fruit packing concern, has perfected plans for handling the coming season's crop. At last meeting it was decided to limit the season's pack to 150 cars and a contract was given the Benchley Fruit Company to handle the fruit. One new feature will be the doing away with labels. Instead the brand and name of the grower will be printed on the box itself. The following plan was adopted for doing business: No fruit shall be pro-rated. All fruit packed shall have the name of the grower on the box and shall not lose its identity. The grower shall have the right to say when and how his fruit shall be sold and when it shall be picked and packed. The manner of selling shall be spot cash when possible, otherwise it will be sold in auction or f. o. b. It is strictly understood that each individual grower has the right to dictate when and how his fruit shall be picked, packed and sold with the understanding however, that all fruit, no matter how sold, shall be packed by the company and shipped under the brand of the company. The idea for this is to endeavor to establish a brand that will, by its excellence, command at all times the highest market prices. The brand selected is I-X-L. The greatest care will be given in picking and handling the fruit from the orchard to the consumer. The grading will be careful and all fruit sent out under the I-X-L brand will be on a par with any sent from the State.—Anaheim Gazette.

VALUE OF THE APPLE CROP.

The New York Commercial Advertiser says that apples are among the important agricultural products of the United States, which stands first in this specialty. The average annual yield in this country is about 176,000,000 bushels. Of course, the total varies from time to time. The value of the apple crop has come to be recognized of late, and especial care has been directed to the raising of the best varieties. The average yearly output of New York State is now 24,111,000. Pennsylvania comes next, with 24,060,000 bushels, while Ohio and other middle western states are large growers. The exportation of apples has also become a considerable trade. In good years we sell abroad not less than 3,000,000 bushels. The foreign appetite for American apples is growing, as they are recognized as most healthful and appetizing articles of food. They have a quality and relish not found in any product of foreign lands. There was a time when apples for the use of the household of Queen Victoria were imported directly from the farm of an American producer.

ORCHARD AND GARDEN.

Making a good stack is an agricultural fine art.

It is best to do right things than to do big things.

What nurseries of vile weeds towns and cities are.

A dose of mowing machine is good for the weedy pasture.

Aecording to the figures of the California State Board of Trade the shipment of fruit and fruit products outside the State have risen from 23,347 carloads of ten tons in 1891 to 77,538 carloads in 1902.

THE "DESPISED" BERMUDA GRASS.

The editor of the San Joaquin Valley Farmer has become a convert to the use of the much hated (in Florida) Bermuda grass. In his paper of October 10th he takes up his pen in defense of this much despised article of "growing value" and defends it in the following vigorous language:

"The popular prejudice against Bermuda grass is something we cannot understand. Being thick, heavy and velvety it is an ideal grass for lawns as well as back yards. It does not require one-tenth the care of blue grass, but you will hear the nonsense of "you can't get rid of it," and it "runs all over." Why should you want to get rid of so hardy and valuable a plant as Bermuda? It makes an ideal pasture for both cattle and horses, and is very nourishing as well as fattening.

"An employe of the Minnewawa vineyard informed the writer that thirty acres of it on a low piece of land there, has supported one bovine to each acre and a few horses besides and all are rolling fat.

"On a trip to Hanford a few days ago, the scribe observed hundreds of acres lying between Goshen and the county seat, heavily impregnated with alkali, producing an indifferent growth of salt grass upon which hundreds of young cattle were eking out a bare living. On the return via the Santa Fe road through Laton and Conejo other hundreds of acres of alkali soils, with its miserable salt grass contained other hundreds of young cattle just above the starvation point. Now every foot of this land will yield a fine pasture of Bermuda grass. Why this land has not been sown to this splendid pasture grass passed our understanding. We have yet to find the stock raiser or small farmer who has been disappointed in this plant. It will grow and flourish on alkali soils; it will withstand drought and excessive moisture alike and, in this climate, affords a good pasture all the year round. By all means sow Bermuda grass and get rich."

The Cultivator is not prepared to endorse the suggestion of the Farmer, until it knows more about the real value of Bermuda grass. It is not a popular grass in the South, at least in Florida, where it is, for some reason, despised by those into whose farms it has spread.

It is the experience of those who have grown alfalfa most successfully that it is much more valuable as a hay if cured in the shade, by being cocked up as soon as wilted sufficient to handle well on the rake, and then covered with the hay cap. Extreme heat seems to cook the life out of the leaves and when too dry from a hot sun the feeding value goes out of the grass.

A first crop of 10,000 tons of salt is just now being "harvested" by the San Pedro Salt Company, whose works are situated about a mile back from the ocean and between Long Beach and Brighton Beach. The last of the first year's crop is just being taken out of the ponds and placed in piles, ready for shipment. The price of salt has been reduced about one-half in this territory, much to the delight of dairymen, to whom this is indispensible.

BEES AND HORTICULTURE.

The benefits the horticulturist derives from honey bees in close proximity to his fruit farm can not be too strongly set forth. The Kansas Farmer says that experiments have proven beyond any doubt that bees are a valuable fertilizer of the fruit blossoms and the means of materially increasing the quantity as well as the quality of the fruit. As a pollen distributor among the fruit blossoms, nothing equals the honey bee, or will come anywhere near it in the distribution of pollen to secure the most effectual fertilization of blossoms. The theory that bees are injurious to blossoms or to sound fruit has completely fallen through since the subject has received the attention necessary to discover the facts.

One would be surprised at the amount of work one colony of bees can do in thus distributing pollen in an orchard, and by no means does it require any great number of colonies to completely pollenize an ordinary orchard. One honey bee will visit several hundred blossoms during the day, and if this is true, how many blossoms will 25,000 bees (the number in a fair colony during fruit bloom) visit during the day? Hence a few colonies of bees in close proximity to an ordinary orchard will completely execute the job.

If the weather is favorable bees will go long distances to visit orchards and I have known them to go in large numbers as far as eight miles. I had a good opportunity to test this at my present locality, and none nearer than 50 miles distant. On several occasions I found my bees on the bloom of a peach orchard just eight miles on air line. But we can not expect to receive full benefits at such distances or anything like it on account of weather inclemencies. The weather also has much to do in preventing bees from thus visiting the blossoms on account of its being too cold for the bees to leave the hives.

By J. W. Jeffrey, Los Angeles

FEAR OF FREEZE-OUT.

The Fruit Trade Journal of New York, prints a doubleheader dispatch from Buffalo announcing that the California Fruit Agency is beginning a game of "freeze-out" with certain Buffalo dealers who refuse or neglect to sign a contract with the Agency to buy oranges exclusively from the latter. Following the announcment from Buffalo of the fell policy of the California organization the Journal comments richly upon the "Combine's" attempt to drive out of business all who will not come into the tent and agree to buy exclusively from the Agency. In the discussion, some points of which contain principles, the New York trade paper fails to grasp the true significance of matters. It speaks, for example, of the absurdity of cutting off orange supplies from two Buffalo dealers as if it were an attempt to cut off supplies from the Buffalo consumers. We can see how reprehensible it would be for the agency to refuse to sell oranges to the people of Buffalo, but we fail to make out the bad policy of selling to the people through certain dealers who are wiling to make a specialty of California oranges in pushing their fruit trade. If one thing relating to the citrus fruit trade has been more thoroughly demonstrated than another it is that there were too many wholesale merchants in the business. Long before the agency was thought of the succumbing of the unfit demonstrated that economic features alone, at this end of the line prevented the maintenance of six or eight packing houses where three or four could handle all the fruit, and this was one of the greatest factors in bringing about last spring the organization of the California Citrus Union, one of the wings of the agency. Do the Buffalo complainants suppose that the Earl Fruit Company, Ruddock-Trench, Spruance and the other members of the Union will now become frightened at incoherent objections to the selection of a few agencies in the East where many are not necesary? Or the Exchange to become panciky because two large firms in Buffalo refuse to become its agents when the two singing firms can supply the trade as easily as could the four? If the Union and the Exchange is not afraid what can make fearful their own servant, the California Fruit Agency?

The Journal makes the artful charge that the Agency (attempted to make odious by calling it a "Combine") would like to drive out of business all the growers who remain independent. We do not believe the agency has any such sinister motives. Even if it did meditate such a course it would be in vain, for have we not been assured for years that these independent growers-shippers were making money hand over fist every year and are therefore invulnerable? Indeed the Journal informs us that these independents are making money because their fruit is handled competently by merchants in the various cities? In looking through the advertising columns of the Journal it is surprising how many of these commission merchants are bidding for the privilege of making the California orange growers rich on commission sales. There are literally scores of such advertisers in this paper and their patronage must be enormous if the Journal gets fair rates for its space. Verily this trades paper should profit in convincing the citrus fruit growers that the "independent grower-shippers are waxing stronger all the time." Convinced of this the commission merchants would renew their "ads" and perhaps even bid up a little for write-ups could a journal be found willing to devote its space to that purpose.

We have not far to look for the source of these diligent attacks from the commission merchants' journals of the East. Self interest is the point from which these attacks arise. We cannot blame the commission men for seeking to again control the fruit marketing proposition. But we do blame them for the vain effort to do up the agency by unfair opposition. It is a matter of life or death to the citrus fruit business. The so-called "Combine" is not engaged in illigitimate methods as has been demonstrated in the columns of the Cultivator for years. It is an economic move of the straightest and most necessary character, and its fulfillment will work no harm to any factor in the citrus fruit industry which is rendering an equivalent to the producer for what it costs. Under this category of necessary factors we do not class the commission merchants, who are, through their organs, making all this noise about the unfair methods of the agency. That institution is but the representative of the principle of selling fruit for what it actually costs to render that service, or its equivalent, in a flat contract very favorable to the growers formerly outside the selling agencies of the Exchange, but now in the Citrus Union in a combination to foster the selling of fruit in the most economical manner. We may be sure that the motive of the eastern attacks of the commission merchants is instigated by the fear that a large number of them will be frozen out and finally lose all connection with the citrus fruit business of California. For the sake of the truth, however, we would like to see the editorial writers of the fruit trade journals of New York become better posted upon the subject at this end of the line. It would save them some mortification in having written most ridiculously of the situation.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO

CO-OPERATIVE WINERIES COMING.

The sudden and unexpected slump in the prices of wine grapes this season will have a beneficial effect in forcing the growers into co-operative societies for handling their own crops. An association of this character has been formed in Sonoma county under the title of "The Vineyard Proprietors' Wine Company.'" The corporation is formed for the purpose of leasing and conducting wineries and distilleries. There are rumors of other organizations of a like nature in different parts of the state and it is not improbable that a number will be in operation by the time the next grape crop is ripe. This is as it should be, and it would be profitable for the wine growers in every community to combine and have their own wineries always in working order, even if they never used them. They would then always have an opening of escape from the wine makers when they felt the latter were treating them unfairly.

* * *

DEMAND FOR WINTER TOMATOES.

There are very many frostless nooks in California from which a very handsome revenue might be derived by the production of winter vegetables for the San Francisco and the eastern market. Near all the great eastern cities this is found to be a profitable industry, even where it requires the construction of expensive glass houses, fitted with appliances for artificial heating, and the maintenance of a high temperature during the intensely cold weather of the winter months characteristic of the eastern states. If, then, the production of winter vegetables is found profitable under all these adverse conditions, how much more so should it be with those of our people who are fortunate enough to be outside of the frost belts of the state; and where the tenderest vegetables can be grown in the open with a little care in cultivation and occasional light shelter on the coldest nights. In such localities, tomatoes especially would be found a very profitable crop, and one of the most easily handled. There are scores of places in the foothills along the mountain ranges from Shasta to San Diego, where this fruit can be produced almost every month in the year, and it is one that always commands a market. During the winter and early spring months, tomatoes are imported from Mexico by thousands of boxes, and of the cargo of every steamer arriving from Mexican ports in San Francisco, tomatoes and peppers form an important item. As a rule these are poorly grown and poorly packed, green and ripe fruit of all sizes and generally of poor quality are packed together in twenty pound boxes, yet these sell readily at $2.50 per box. There is no reason why our own people should not have the benefit of this market, or the wider market of the East, for the early fruits and vegetables which our frostless sections can produce.

* * *

A PROSPEROUS FRUIT SEASON.

The fresh fruit shipping season in Northern California is practically ended, for while shipments of table grapes will continue for two or three weeks yet, the daily shipments are growing smaller. Apples now form the bulk of fresh fruits going out of the state. Apples, however, are not generally classed with our fresh fruits in speaking of the fresh fruit season, but are placed in a class by themselves. The season, throughout, has been a most favorable one to the grower and for the first time nearly all returns have been on the right side, and the grower can figure up the profits on each carload with a good deal of satisfaction. "Red ink" returns have fallen into disuse, and with a few small exceptions, there have been profitable returns on all carloads and, on some, an extraordinary margin of profit. While the volume of shipments has not come up to early expectations, it has exceeded that of last season, and in the matter of returns this has been one of the most prosperous seasons our fresh fruit men have ever known.

* * *

THE COMING TREE PLANTING SEASON.

Every year we are all warned against further orchard and vineyard planting, and every year no one pays any heed to the warning. We learn from nurserymen in the northern counties that they have already received large orders for stock delivery during the coming winter and the prospects are that the acreage set to new orchards will be equal to, if not greater than that of any former year. Peaches, prunes and apricots are still the favorites and orders for these are heavier than any others. The apple, however, is steadily growing in favor, and will be very extensively planted in all sections of the state that are at all adapted to it. Orders for apple stock are heavier than ever before.

* * *

INTERESTING MATTER ABOUT THE CODLING MOTH.

Among the papers which will be presented at the coming Fruit Growers' Convention are two of especial interest to apple and pear orchardists. One of these is by Prof. Woodworth on "New Observations on the Codling Moth," and the other by Prof. Clarke on "Spraying Operations in the Pajaro Valley." These gentlemen have carried on a long, persistent and successful fight against one of the worst insect enemies of the fruit grower, and will now tell what they have accomplished. The apple growers of the Pajaro Valley are well satisfied with what has been done and claim that they have but now 3 to 5 per cent of wormy fruit against 40 to 60 in former years. Prof. Woodworth has discovered new habits of the Codling moth, the knowledge of which will enable our orchardists to attack her at the most vulnerable period. It has been demonstrated satisfactorily what intelligent and persistent work will accomplish against this most serious pest and this knowledge will be made public by Profs. Woodworth and Clarke at the next convention.

A quarter of a million dollars worth of goat skins is annually imported into the United States. Here is an industry the California farmer might profitably engage in.

WALNUT CROP IN FRANCE

C. P. H. Nason, U. S. consul, Grenoble, France, under date of October 4, 1903, writes:

The latest advices from the walnut-growing districts of the valley of the Isere are to the effect that the coming crop is in a fine condition. All reports agree that this year the yield promises to be very abundant, and the fruit itself of an excellent, choice quality, providing always that nothing untoward occurs to mar these prospects before the harvest time, now near at hand. Thus for this season the weather has been all that could be desired for the normal development of the nuts, neither too dry nor too wet, while the nuts themselves are well formed, healthy in appearance and free from spots.

As to the yield of the harvest, it would not be prudent to venture an opinion as yet, since the best experts are disposed to make varying estimates for special reasons from their own point of view. In any event, presupposing favorable conditions, it may be said safely that it will be large—probably one-half larger than the crop of last year, or say, to fix an approximate figure, about 40,000 bales of 100 kilos (220 lbs.) each. Of this quantity it is expected that the American market will absorb one-half, especially if the quality of nuts proves to be fine, as it is anticipated, and prices rule easy.

As to the opening prices it would seem, in view of the promise of an abundant crop, that low figures are likely to prevail this season as compared with those of last year, for it is reported that within the last few days some few contracts have been concluded between buyers in America and sellers here, for future deliveries of the new crop, on the basis of 73 and 75 francs per 100 kilos. c. i. f. New York (about 6½ cents per pound) and some enterprising dealers are said to be offering to sell walnuts of the new crop on the American market at 72 francs per 100 kilos, same conditions.

SCUTELLISTA CYANEA.

Editor Cultivator:—Will you please tell me where to procure the bug which eats the black scale?—A Subscriber.

You should file your application with the County Board of Horticultural Commissioners, as they are prepared to send out colonies to districts which need them. It is too late now to secure them inside the next seventy or eighty days, as they are not very numerous in the egg or pupa state at this time. Write to J. W. Jeffrey and when your turn comes you will be supplied.

* * *

PITLESS PLUM AND PEARL MILLET.

Editor Cultivator:—Will you please tell me what plum the enclosed pit belongs to? It is a tart reddish plum, clingstone, which settles to the bottom when cooked. In the Cultivaor of Ocober 9th, mention was made of a new kind of cattle feed, Pennisetum. Where can I get plants or seed? What can you tell me about it?—L. C. Smith, Redlands.

The plum you sent must have been nearly a pitless one, as only a piece of shell was to be found in the letter. We would not venture a guess on simply a pit, we would need at least one typical specimen of the mature fruit.

The forage plant referred to in the issue of October 9th is without doubt Pennisetum spicatum. It is by no means a new plant, having been raised in this country for over thirty years and is known to have been raised extensively in Egypt for over 300 years. We have grown it on the damp lands of the Chino ranch during the last four years and consider it a good green crop for stock. During the season of 1899 it grew to be seven and eight feet high and was much relished by stock.

This millet was introduced into this country about the time the sorghums and Egyptian corns were, but unlike them, it has changed its names often to suit the spasmodic efforts of seedsmen to introduce something new. Following are some of the names under which it has been offered for sale in this country: Manns Wonder Forage Plant, African cane, African millet, Bajree millet, Black millet, Brazilian millet, Bulrush millet, Cat-tail millet, East Indian millet, East Indian Pearl millet, Indian millet, Egyptian millet, Horse millet, Japan millet, Pearl millet and Pencillaria. Under these different names it has been boomed by seedsmen at fancy prices, while if the farmers had only been supplied with reliable information, they need not have spent so much money experimenting with something they could have been enlightened on. It is a good forage plant but can be bought cheaper under the name of Pearl millet than under any of the other names. Those firms advertising it under the name of Pearl millet charge from 12 to 40 cents per pound. Those selling it under the other new fangled names charge from 75 cents to $1.50 per pound and one seedsman in Germany asked at the rate of $69 per pound.

Pearl millet requires rich moist soil to give the best returns and will stand considerable alkali. It will stand several cuttings in a season, and authentic records show that it has produced from two to sixteen (16) tons of cured fodder per acre. As far back as 1879 it was recorded that in this State on very rich land, it produced 31 tons of green fodder per acre at one cutting. It produced in Kentucky, 20 tons the first cutting and 19 tons the second cutting per acre. It is not so nutritious as sorghum, but makes up in quantity, and is very palatable as is shown by the avidity with which stock of all kinds eat it.

This millet does not require treatment much different from that of ordinary fodder plants. Thorough cultivation up to the time of planting being essential to keep all weeds down and retain all the moisture possible. Planting should not be done until after all danger of frost is over and the ground warms up well. The seed should be drilled in as a better stand is assured. When it is intended for green feeding, the rows should be at least three feet apart, but for hay, they should be about eighteen inches so that it will not grow too coarse. It is a difficult crop to make hay of as it is almost impossible to cure it on the field in ordinary weather, before the new crop will come up through it, and if the yield is very heavy, there will not be room enough on the land on which it grows, to cure it. It requires about 4 pounds of seed per acre for the thinner planting and double that for the close planting. Sown broadcast, it will require about 25 pounds per acre.

* * *

GROWING LOGAN BERRIES.

Editor Cultivator:—Will you please inform me how to propagate Logan berry vines, also the proper time and dimensions for proper trellis?—Subscriber, Yuba City..

The tips of Logan berry vines should be buried and kept moist. several plants may be secured from one cane by burying it the full length, but better plants will be obtained by burying it near the end, leaving just enough out so that it will continue to grow. When it gets long enough to repeat the operation do so, and if you commence early enough in the season, many vigorous plants may be secured from one plant. For plan of trellis, see the issue of October 23rd. Heavy posts at the ends and light slats or stakes at short intervals when wire is used. When lath or boards are used for trellis, the distance at which the stakes are set depends on the length of the lumber.

* * *

AGAWAM GRAPE CUTTINGS.

Mr. J. H. D., of Santa Ana, wants to know where he can buy Agawam and Lindly grape cuttings and if the station will send any out. We have none that are not engaged, having but two vines. These varieties are not new and can be secured from or through any of our nurseries.

* * *

CORNICHON GRAPES AND GINSENG.

Editor Cultivator:—I wish to ask if you think Ginseng growing would prove profitable in this locality? I hear great reports of it east of the Rockies but know nothing of it here. Please let me know what you think of it. Also, tell me how to prune my Cornichon grape vines so that they will stop running all over everything, and will bear some fruit.—Subscriber, Garden Grove.

We cannot give you any encouragement along the lines of Ginseng culture in Southern California. Its native habitat is in the dense, cool and damp forests of the Northern and Middle States, extending into Canada. You would have to reproduce those conditions here to make Ginseng thrive, and you will find it very expensive and well nigh impossible. The circulars that are being sent out advertising it are very alluring, but we would advise prospective growers to invest very little money in it until they have experimented on it on a very small scale. Those who seem to be making the big money out of it seem to be those who are selling seeds and roots for from 25 cents to a dollar apiece to prospective growers. You may remember the Belgian hare boom. It started in about as mildly as the Ginseng agitation has, but we predict that it will not spread as rapidly. It will not reproduce its kind so rapidly. Remember, if you decide to experiment with it, you will have to expend from four to six years of patient toil and care before you will know if it is a success or failure. You cannot harvest commercial roots under that time.

You should prune your Cornichon vines half long. Where you have two canes on a spur, cut one to five or six buds and the other to two buds. You will get your fruit on the longest cane and the two-but spur will produce two canes the coming season from which you can repeat the operation. At trimming time, after you have established this kind of pruning, remove the old six bud on cane with its old bearing canes, and you will get rid of all that brush which will then have served its time. By leaving the six bud cane on the opposite side from which you did the previous time, you will be able to keep the vine in shape. Just remember that the two bud spur is always retained and its position determines the shape of the vine, therefore, shift it on the other side of the long cane each year and it will form an arm that will have a general straight direction.

PERFECT GROWN CITRUS TREES

The cut to the left shows a budded citrus tree as grown in the San Dimas Citrus Nurseries, showing a perfectly shaped head to make a first-class and profitable tree when planted out. It is a one-year-old bud, affording a splendid object lesson of the superior orange and lemon trees we are now offering. Our monograph on "Citrus Culture," — finely illustrated — tells all about planting and care of orange and lemon trees. If you will write we will be pleased so send you one.

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

P.O. BOX 14 FRESNO, CAL.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.
(Continued.)

The three first items in this article should have appeared last week under Prof. Cook's discussion of insects, but the length of the article forbade their publication.

* * *

Aphids or Plant Lice.—Few who have anything to with plants need to be introduced to the aphid pests. The insects are flask shaped, have long antennae and sloping wings which fold on the back. They are interesting not only from the great damage that they do, but from their enormous prolificness and their novel mode of reproduction. They are so pestiferous that were it not for natural enemies of which they have near a score, they would render agriculture most discouraging.

So rapidly do they increase that it is stated that the progeny of a single female which lays eggs in the fall, might reach three billion the next year should all live. In the fall there are both males and females. These pair, after which the female lays her eggs on the twigs of plants, usually near the buds. In the spring from these hatch only females and these give birth to other females the summer through, there being no males till autumn. I say give birth, for these are born alive and do not hatch from eggs. This novel mode of reproduction is known as agamic or parthenogenesis. Of the many broods in a season, there may be a dozen, occasionally one comes with wings, though nearly all are wingless.

* * *

Tree Hoppers—Closely related to the leaf hoppers are the tree hoppers. These are remarkable for their bazarre forms. Parts of the body, usually the head or prothorax are prolonged into great spines, often producing a very grotesque effect. A collection of these tree hoppers cannot fail to cause amusement by their oddity. While all feed upon plants they are rarely sufficiently numerous to do any great damage.

* * *

Jumping Plant Lice.—These insects appear like tiny cicada and like the two families just described are also jumping or hopping insects. In all these cases the hinder legs are much thickened and used to propel the insects as they hop from the leaves or the twigs. While they are called jumping plant lice, they are really quite different from the true aphids. The wings are more complex in their venation. The pear tree psylla belongs here and has done not a little damage in the Eastern states. It is strange that so tiny an insect, only one-tenth of an inch long, can do such formidable damage, yet there are millions of them and minute as they are they have been known to destroy whole orchards. The distillate spray would undoubtedly be an efficient remedy against these pests.

Every lady with house plants, every keeper of a green house, and every gardener and orchardist realizes the danger from these plant lice. The melon growers in the Coachella valley have been seriously troubled by the melon aphis. A well known habit of these insects is the secretion of honey dew which attracts the ants and these in turn protect the apihds against their many foes. Honey extracted from this honey dew is often excellent in quality. In most cases the natural enemies will keep these in check. In case they fail to do so, kerosene emulsion or better, the distillate spray, and where is can be confined, tobacco smoke are found quite sufficient in destroying these little sappers. In our next article we shall finish the bugs, in describing the last two families, the White Flies and the Scale Insects.

* * *

SPOTTING OF FRUIT AGAIN.

The worst case of spotted fruit that I have yet seen was brought to my study the past week. The spots are large and the injury seems deep and mars the fruit more seriously than anything I have before seen. It seems a very grievous matter and I have sent for the Commissioners of San Bernardino county and will, with them, visit the orchard next Monday. I have never seen anything like this before and feel sure that neither fumigation nor spray causes any such trouble. I hope that Monday will reveal the cause.

* * *

LEGUMES IN THE ORCHARD.

Mr. C. C. Teague of the Limoneira orchard asks my opinion of the effect of a green crop in the orchard in winter in adding to the injury from possible frosts. He was proposing to put fenugreek in his orchard but was told by some one that orchards with green crops were more likely to be injured by frosts. He asks if I agree with the above opinion. I certainly do not. I think the tendency of the green crop would be helpful but I think its influence would be so little that it need not be regarded. Frosts are promoted by radiation from the earth. Clouds, or anything that acts as a blanket serve to prevent this radiation and thus help to protect against frosts. I should suppose that a green crop would have this same tendency. In another way, I should suppose that the green crop would aid in battling this frost evil. It feeds the soil generously with nitrogen. This in turn makes strong plants and strong plants are always the ones that are strong to resist frost or any other enemy.

* * *

WATER FOR ALFALFA.

Mr. C. W. Leffingwell of Whittier, asks me to report through the Cultivator any knowledge that I may have concerning the amount of water necessary to grow a crop of alfalfa. I have consulted two of our exeprienced alfalfa growers who are very successful in growing this magnificent forage plant south of Pomona. These gentlemen have wells on their place and thus are not limited in the quantity of water which they have at command. On a five-acre piece they used 75 inches allowing it to run three days of ten hours each. They irrigate, using this amount of water, once for each crop, about every four or five weeks. This is applied just after the crop is cut, and they aim to thoroughly soak the ground. The soil in this section is rather light sandy loam. As I remember the soil at Mr. Leffingwell's place I should think that it was a clay loam, and therefore a much heavier soil. Such soil would take less water and would be more retentive of moisture so I presume the amount required would be somewhat less than is given above. Will not others who have had experience report throngh the Cultivator?

* * *

THE APRICOT SCALE.

Mr. W. L. Cunningham, Windsor, California, desires the Cultivator to give a full account of the brown apricot scale which is doing great injury to the prune trees of his county. He is sure that the readers of his section would greatly appreciate all possible information regarding the life history of this scale and any remedies that may be expected to eradicate the pest. This is a common scale in the northern part of our state and is known to science as Eulecanium (Lecanium) armeniacum. It was named by our own Professor Craw. He first mentions it in the report of the California Board of Horticulture, page 12. It is a close relative of the peach scale, frosted or prune scale, pulm scale, currant scale, and tulip tree scale. It is also much like the common black scale. Its life history and habits are much the same as we find in any of those just mentioned. Some sent me in June hatched out in that month. They are annual, are very prolific and secrete honey dew. as do all similar scale. I have never had any experience with these scale but I have seen so much of kindred scale that I have little hesitation as to advising a treatment. The parasite comys fusca, a chalcid, preys upon this scale. This parasite could be got of orchardists about San Jose. There is no doubt at all but that the distillate spray would destroy the young of this insect. In the month of June, after the insects had all hatched its use on the prune trees would certainly be very effective. I shoulld suppose that the fruit at that time would be in condition so that the spray would not do any possible harm to it, yet I would certainly urge that the spray be used in a small way until positively assured. I believe that a two or three per cent spray would kill all of the young scale and would do no injury to the trees. It is to be hoped that this scale hatches quite uniformly in which case there would need be no second application, as one thorough spraying would kill all the insects. I have not tried this distillate spray on deciduous trees but have used kerosene emulsion very largely on such trees in the East, and from what I have observed in regard to distillate spray I should use it with very great assurance of success.

Mr. Cunningham wishes to know what kind of a sprayer to use. This distillate spray is not an emulsion, but is simply a mechanical mixture. The machines used in Southern California are run by gasoline engines, which are placed on the wagon with the tank.

The oil and water are mixed in the right proportions and the machine by a sort of a churn thoroughly mixed the two liquids. Horses are kept on the wagon and move along as fast as the spraying is done. The whole cost is about $390. The great advantage of the spray is its effectiveness in killing the scale insects and its great advantage in cheapness. If done by the owner of the orchard and I think it always should be, it will not cost more than one-third or one-fourth as much as it does to fumigate. I have long urged the great importance of each neighborhood owning its own machine. Then the spraying will be done just when it ought to be, will be very likely to be well done as the owner either does the work or superintends it, and the saving of a single season will very likely pay for the machine. The point to be kept steadily in mind whether we are to fumigate or spray is to do the work well. To be penny wise in this case is certain to be pound foolish.

GO TO GARDENA

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret — there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 8 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room honse, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

For information about these places and other good bargains in Gardena property, write to

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

HORTICULTURE.

California has an area of 85,000 acres planted to orange trees.

Pajaro Valley apples are selling for good prices in England.

The olive crop of Orange county is larger than for several years last past.

John Rosasco, of Healdsburg, sold his crop of prunes at the rate of $100 per ton.?

Ranchers are saying that next summer they will use the lead arsenates in spraying.

Oranges are beginning to ripen in the vicinity of Porterville. The crop will be large.

The Earl Fruit Co. has shipped about 100 carloads of apples from Watsonville this season.

The "Belle" peach of Georgia was experimentally planted in California, and successfully.

The Hoyt Tree Support Company of Watsonville has shipped 250,000 tree supports to Riverside.

The Lemon Cove Citrus Company shipped the first car load of lemons out of Tulare county this season.

The Rosenberg Brothers Company are doing an immense packing business now. Forty tons of raisins are some days received.

The bankers attending the national convention here last week were freely fed on apples from Pajaro Valley and they pronounced them very good.

The Southern California grape growers will follow the plan of Northern California growers and organize an association and make their own wine.

Dr. H. W. Westlake, of Duarte, has 5000 citron trees of the Corsican variety. He is the first man in the United States to successfully grow this fruit.

The co-operative cannery at Oakdale in Stanislaus county was burned to the ground last Sunday. The loss was $5000, with $3000 insurance on the property.

E. T. Barnard's packing house in Visalia was destroyed by fire the 24th inst. One hundred tons of prunes, two cars of peaches, one car of raisins and a lot of valuable machinery were lost.

It is asserted by an Oakland horticulfurist that if the English black walnut is grafted on the California walnut tree when the latter is three years old, it will bear a merchantable nut of great value.

Swan & Son, near Palo Alto, raised this year two carloads of seeds from 250 acres. The seeds consisted of onion sets and lettuce seed. Next year they will plant an increased acreage which will require 6,000 sacks of seed to plant the tract.

The pear crop in Sonoma county was poor this year. Last year the codling moth did great damage. This year at least two-thirds of the crop was unfit for canning because of the scab. Most farmers fed their pears to the hogs. Some dried the fruit.

Humboldt county is going to the front as an apple producer. George Stewart, near Eureka, has a very fine orchard and has this year raised a very superior crop. He offers his pickers $10 for the first apple they bring to him containing a worm.

A "silk company" has been organized at San Diego. A lady member says a couple of dozen trees in the back yard, a spare room and a few inexpensive trays is enough to raise cocoons worth from $100 to $200 per annum. It is claimed that the climate of California is specially adapted to such culture because here we can grow silk for nine months in the year, while in other countries they can not grow at a profit for more than seven weeks per annum. One acre of mulberry trees will produce from 70 to 110 pounds of silk.

Some time ago the American Grape Acid Association, through A. Sbarboro, chairman of the California Promotion Committee, offered a prize of $25,000 for a formula for producing cream of tartar from grapes. Now comes William Coldsworthy, of Tipton, Iowa, who is ready to demonstrate that he has the correct formula and will claim the prize. If he is successful the discovery will be a great value to California.

The experiments of Prof. H. J. Webber, government expert, are being carefully observed by horticulturists. He proposes to produce seedless apples, grapes, watermelons, tomatoes, thornless blackberries, also strawberries and blackberries combined, and a combination of orange and grape.

The Los Gatos Fruit Growers' Union is sending out large quantities of packed fruits under the "Gatos" and "Pathfinder" brands. Other canneries of Los Gatos send out daily an average of about five cars of fruit. Mr. Curtis of the same place is shipping barrel prunes which are to go to France.

G. B. Robbins and Robert Graham, officers of the Armour car line, made the statement at San Francisco a few days ago, that during the season 182,000,000 pounds of deciduous fruits and grapes were shipped eastward from California. This amounted to 7000 car loads. The total net profit was $2,100,000.

The California Raisin Growers' Association of Fresno, after a strenuous effort to control the industry in that county, succeeded. Outside packers bought heavily at 4½ cents clear, in the sweat box. The association then dropped the price one cent a pound and badly pinched the outsiders. The association has the situtation well in hand.

The American Grape Acid Association has deposited $25,000 with Daniel Meyer, banker of San Francisco to be given to the individual who can successfully furnish a formula for utilizing the California grapes so as to produce tartaric acid from grapes containing over thirty per cent. of saccharine. This offer stands good until December 1, 1904.

MISCELLANEOUS.

California has 3,925,000 acres of land under irrigation.

A deep sea wharf is to be built at Huenema for the benefit of the Bakersfield Electric Railroad.

The flower show held at Menlo Park the 22d and 23d instant was a very attractive exhibition.

J. J. Adams, of Kings county, presented to the Hanford Board of Trade a sunflower measuring 17 inches in diameter.

Orders have been issued to patent every acre of Southern and Central Pacific lands. 2,700,000 acres yet remain unsold.

The people of Windsor will hold a bazaar on November 6th and 7th and the proceeds will be applied in town improvements.

Chile raised a crop of 50,000 sacks of English walnuts this year. They very much resemble the walnut raised in California.

The Saunders family of Cotati narrowly escaped from death last week from ptomaine poisoning from eating canned corn beef.

The Southern Pacific Company has recently received 245 passenger coaches 125 of them being chair cars, 15,616 freight cars and 337 new locomotives.

It is now stated that South Africa is so productive that she will ere long be a serious competitor of the United States in Europe in grain and fruit.

Marseilles imports large quantities of cotton-seed oil from the United States, mixes it with olive oil and sends the mixture back to us for our consumption.

The California creditors of the Porter Brothers Company, the big fruit firm that failed some months ago, will not get over twenty cents on the dollar for their claims.

A movement now nearly consummated was recently begunin Chicago to amalgamate 500 building and loan associations into one gigantic combine. It will have a capital of $40,000,000.

Coast News and Notes

CONTINUED

Heretofore it was supposed that the Rubber tree could be produced only in Mexico and Central America. O. F. Cook, of the U. S. Department of Agriculture, has been investigating the matter and raises the hope that the tree may be successfully grown in Southern California.

A gentleman from Brazil says coffee is an antidote for alcohol. In Brazil the inhabitants drink coffee several times a day, and intoxication is rarely seen. Even foreigners, heavy drinkers of whisky, who settle in Brazil often are cured by adopting the coffee habit of that country.

On the 17th the Secretary of the Interior withdrew from entry thirteen tracts of land in Alaska, to be devoted to reserves for a salmon hatcheries. This was on recommendation of David Starr Jordan, who was last summer sent to Alaska by the government to investigate the matter.

There may now be found in American markets two substitutes for silk. They both come from Europe. One is made from wood. The fabric looks very much like silk but it has but little strength. The other is made from cotton. It is a most clever imitation of genuine silk.

Chas. L. Davis, of Petaluma, has invented a new kind of paint and varnish remover. It is a liquid. With a cloth saturated with the fluid, old paint can be easily removed, leaving the surface perfectly smooth. A stock company capitalized at $300.000 has been organized to manufacture and sell it.

A federation of women's improvement clubs of the Sacramento valley, recently held a meeting at which steps were taken to plant shade trees and inaugurate other improvements in Oroville, Auburn, Winters, Colusa, Marysville, Wheatland and other towns in the valley.

There has been landed at San Francisco a small cargo of native farming implements, samples of timber, etc., from the Philippine Islands, to be put on exhibition at the St. Louis fair. A native Filipino brass band of seventy-five instruments are on the way to the exposition, also 100 native Filipino students.

F. H. Newell, chief hydrographer of the Geological Survey who has charge of the irrigation work of Nevada, says after the Government accomplishes what it contemplates in the way of irrigation, that state will have a wonderful development. Instead of having a population of 40,000 as now, it will in a few years have 500,000.

R. J. Hamilton, of Philadelphia, who attended the bankers' convention here last week, said that this year's cotton crop is eleven million bales and the corn crop about two billion bushels, while wheat is about an average. He added. "The crop conditions are satisfactory, but there is some uneasiness among bankers, because of the depressed condition of the stock market on Wall Street."

Work on the great million dollar irrigation canal has commenced. It starts from the Truckee river east of Reno, Nevada, and will end at the Carson Sink, 32 miles distant. 350,000 acres of arid land will be watered. About 300 men are now at work. Later on 2,000 men and 1,500 horses will be employed. The reclaimed lands will be homesteaded at the proper time.

John Hamilton, Farmers' Institue specialist of the U. S. Department of Agriculture, has made the important announcement that it will be part of his work hereafter, to devote a part of the institute session to teaching boys and girls. We must, he says, have a boys and girls department and instruct them. He adds: "Too often it happens that a farmers' institute is made up of a few retired farmers. It is estimated that five hundred thousand farmers attended the farmers' institute meetings throughout the United States last year. But who takes notice of the boys?"

It is claimed that the general government has determined to try the experiment of producing every plant imported in this country in the experimental station now being located in California. P. H. Dorsett, superintendent of the Plant Introduction Garden, has been in consultation with Luther Burbank relative to the matter. This is a movement of great importance.

AGRICULTURE.

Wheat sowing has begun in some sections of Central California.

Prof. Fowler will conduct a Farmers' Institute at Corning November 20th and 21st.

A field of 600 acres at the Cone ranch in the Antelope valley, is being prepared for alfalfa.

The Japanese have, since the fifth century, produced silks. One cargo of silk eggs brought them $2,500,000.

The Pasadena Farmers' Club met this week at the home of Dr. Grinnell. The topics discused esepecially were Johnson grass, C. A. Day; Bees, Mrs. Grinnell.

Prof. Geo. A. Colby has been appointed by the general government to make chemical analysis of food products imported into this country at San Francisco.

Late rains have damaged the wheat crop of Washington 30 per cent. The crop was originaly estimated at 19,000,000 bushels. The estimate is now 12,000,000.

J. P. Quimby, of Kings county, sent in to Chittenden & Co., of Hanford, a tomato that weighed 2¼ pounds, and measured 17 inches in circumference.

Much interest is being taken by the farmers of Geyserville and vicinity in the Farmers' Institute to be held there October 30 and 31. Premiums will be distributed to those who exhibit the best fruit or farm products.

Walter Armstrong, of Sebastapol, intends to drain off a number of acres of pond, and plant a lot of celery at the proper time. He says this drained swamp will raise as fine celery as is produced in Orange county.

Fritz Werner, near Livermore, raised string beans this summer, the pods of which measured thirty inches in length. They are tender and palatable. The seed was procured in Calaveras county.

The directors of the newly formed Independent Packing Company of the West, met in Denver last week. The capital stock is $5,000,000. Fifty-one per cent. of the stock will be held in escrow. This association is organized to fight the meat trust.

The first carload of celery from Southern California has been shipped. The celery is of fine quality and is expected to bring a good price, celery and cauliflower are two new industries in Southern California and they promise much in the future.

California was allotted 40,000 square feet space at the St. Louis Exposition, but that has been found to be inefficient and more room has been applied for. The entire grounds to be occupied will double the area used at the Chicago Exposition and the buildings will be more magnificent.

The State Board of Trade estimated the value of the 77,538 car loads of fruit shipped out of California last year at about $35,000,000. This year it is believed the eastern shipments will reach 86,000 car loads. The following shows the shipments the past five years: 1898, 56,149; 1899, 55,482; 1900, 66,797; 1901, 83,731; 1902, 77,538.

J. B. Meloche, of Stockton, has made a careful calculation of the amount of beans raised in the state this year. He says the crop is 5000 tons less than last year. He has kept the bean record for four years and gives the yield as follows: In 1900, 18,375 acres and 16,000 tons; in 1901, 24,720 acres and 23,638 tons; in 1902, 28,180 acres and 25,633 tons; in 1903, 31,700 acres and 20,350 tons. He says there is on hand in the State 10,445 tons, or 249,000 sacks.

LIVE STOCK.

California has now $125.000.000 invested in dairies.

The anthrax among cattle in Inyo county has been stamped out.

At a late sale, held at Cloverdale, 300 bags of wool were sold at 13 cents per pound.

The Tulare Co-operative Creamery has been incorporated. The principal place of business will be Tulare.

King Edward VII, of England, is a great lover of pure-bred stock. He makes about $200,000 a year on his cattle.

In 1902 this State produced 28,783,859 pounds of butter and 5,000,000 pounds of cheese. It will make a better showing this year.

Dr. Charles Blemer, State Veterinarian, says: "We have had less trouble with cattle diseases in this State this year than ever before known in California."

Jacob Baier, a butcher in Denver, dressed a 1200 pound steer in three minutes and thirty-eight seconds. The feat was accomplished in a contest and beats the world's record.

George Jackson is arranging to establish a creamery with a fifty gallon churn at Altamont. He has fifty cows of his own and will use the milk of many cows owned by neighbors.

Nebraska is going to the front as a dairy state. One factory in Lincoln puts out 42,000 pounds of butter each day. California is naturally a better dairy state than Nebraska.

The Tulare Register says the law prohibiting the sale of oleomargarine, except under its own name, is proving to be a good law for the dairy farmers of the San Joaquin Valley.

John Cockcroft shipped 25,000 pound of mohair from Corning during the past week, and also expected to make another shipment from Orland during the same period. At least so says the New Era.

At a meeting of the Board of Health of this city, held October 23d, it was determined to raise the standard of milk allowed to be sold here. The proposition is to raise the percentage of butter fats compared with total solids.

A woman of Sonoma county aged 79 years, outclasses all her neighbors in poultry raising. She is a widow and for sixteen years has personally managed her farm and is making money. She raises some of the finest chickens seen in the county.

Organizer H. Murray, Judge E. F. Emery and others are canvassing Sonoma county and holding meetings urging the poultry raisers to join the county co-operative association of poultrymen. A thrifty branch has been organized at Cotati.

E. M. Wheeler, of Santa Ana, has just purchased of Mr. Sibley, owner of Moore Hill farm, Spencer, Mass., the young island bred bull Interested Mon Pleaisir, a son of Mon Pleaisir, the sire of Mr. Coutt's Pacific Golden Lad, and from an imported Island cow.

It is charged that swindling milk men in this city have been daily selling with their milk 5,000 gallons of water. The bad thing about it is that they do not use pure water in their adulteration. It is said many cases of typhoid fever are traceable to foul milk.

HORSES FOR SALE.

Some very fine driving horses and brood mares. I am closing out my stock.

P.O. Box 1, Escondido, San Diego Co., Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

Signora Bruce Butter Test Oct. 7-13, 1903.

Editor Cultivator: Have just finished making an authenticated butter fat estimate of Signora Bruce 15457, owned by Guy H. Miller, Riverside, Cal. I presume a report of this test would be of interest to many of the readers of the Cultivator, as this is the first authenticated butter fat estimate made by an appointee of the American Jersey Club, New York City, N. Y., thus making this an official test, it will probably be of more interest that it otherwise would be.

I hope Mr. Miller has set a good example to Jersey breeders by heading the list of authenticated butter fat tests, as the cost of making these tests is very light, and of but little trouble to owners of Jersey cows, and of inestimable value to them. I should think every cow capable of making test would be tried out. The number is not great that is capable of making the required 14 lbs. of estimated butter containing 85 per cent fat in seven days, notwithstanding the many claims of owners of sows of all breeds. When they are put to the test there is no guess work. They must produce the milk that contains the fat equivalent to 14 lbs. of 85 per cent fat butter.

In looking over this report notice the difference in quantity of milk given, also the great variance in test of same, showing the fallacy of a single test of a cow to establish her worth.

SIGNORA BRUCE BUTTER TEST.

		Weight of each of the 14 milkings	Test Bottle No. 1	Test Bottle No. 2	Butter Fat in Each Milking	Total Daily Butter Fat	Daily Butter Estimate 85%
7	A.M.	19 lb	4 9	4.9	.931

Total Milk, 250 lbs.
Average Test, 4.94.
Total Butter Fat, 12.288.
Total butter 85% fat, 14.453.

Signora Bruce was milked out dry in my presence at 6:30 p. m., October 6, night before test commenced; she was milked in my presence each and every milking at 6:30 a. m. and p. m., for the following 14 milkings. I weighed the empty milk bucket before and after each milking, after which I immediately took out two samples. After milk was poured four times from one pail to another I took as soon as possible ½ test sample. I then took another ½ sample, then poured again for test bottle No. 2, until two tests were taken. I used guaranteed, accurately graduated test bottles, the pipetto used being the most perfect instrument I have seen or used, the most accurate obtainable. One can see the reading of bottles corresponds perfectly, there being no difference in reading but once during the test. The scales used I know to be correct. As I had the honor of the appointment by the A. J. C. C. to test this cow. I wish to say the test was made as carefully and accurately as is possible to be done, and the cow justly deserves the credit due her of 14.45 lbs. in seven days. I have sent my report to the A. J. C. C., where the test will be recorded in authenticated butter-fat book.

I noticed Mr. Miller fed 5 qts. of ground barley twice daily, and all the alfalfa hay the cow desired twice daily also. Now, if Mr. Miler was on to his job and could feed fat into milk, as some claim is possible, it is quite evident in my mind that a much larger record would have been made, and I further believe that there would be many more tested cows in California if breeders were told by knowing ones the secret. I notice, however, that in every case where it has been tried, they have failed to increase the fat, only as the increase of milk is produced, and in that proportion only—as will be seen in looking over report of this test. The flow of milk and richness of same fluctuates greatly with some cows; others not in so marked degree. It is possible to increase fat in milk. Also increase flow; but to increase fat for any great length of time is impossible. Walk a cow, say 8 miles a day for three days; at the end of that time you will see a marked difference in the fat in her milk, as also in her flow, which will be greatly decreased. A cow will produce a certain amount of fat and to make her increase 2 or 3 pounds more in seven days is the trick I would really like to learn.—C. S. Burgess.

A REFRACTORY COW.

Professeor Cook writes the Cultivator of a device he has made to cure his cow of lifting her feet while being milked. He says:

We think a great deal of our cow. We have reason to. She supplies four families abundantly with milk. She is a partnership cow as each family has one fourth interest in her. Like all good cows, she has a nervous disposition, and with very little provocation, while she is being milked, a foot is apt to rise altogether too vigorously for the comfort of the milker. It is not, however, difficult to keep her from doing any harm, yet it does make the time of milking a time of anxiety. I have borne this with meekness and patience now for two years. As the habit seemed to grow upon the cow I bethought me of a plan to stop it. I now use a short strap with two loops next to the buckle. I loop his about one foot just above the dewclaws and then buckle it about the other. She objected vigorously the first time, but now seems utterly cured. I recommend the strap.

Why do we abuse the horse when he is the best friend we have next to the dog.

VALUE OF MIXED FARMING.

The farmer who judiciously follows a good line of mixed farming is pretty sure to make a profit out of at least one line, while if, on the other hand, he confines himself to one special line of production, there is danger of taking it up just at the time when there is a depression in the very products he is trying to produce. Mixed farming should be carried on in such a way as to make the farm operations blend, and where there is a failure in one particular crop or division of live stock work, there will be some crop produced or branch of live stock that will come to the rescue. Of course, the getting of too many irons in the fire should be avoided. Develop those lines in mixed farming where experience has taught that there is greater possibility of gain than loss. Branch out into new fields gradually, but keep ever on the alert for new ideas. New lines of work should be worked into the farm plans slowly—but if done with care it may become educational in the studying of new crops, different breeds of live stock, etc.

Mixed farming is coming to the front rapidly in this country, due to the operating of small farms. The idea of extensive farming is spreading rapidly and the era of large farms is passing, and the success of our farmers, taken as a whole, today in most sections of the country is in depending upon the carrying on of mixed farming along up-to-date lines, putting brains as well as brawn into the work. —Fruit and Irrigation Age.

MAKING FARM BUTTER.

Better butter can be made on the farm than at the creamery if the same care is given. The managers of creameries secure the best assistance to be had. The advantages possessed by the farmer who makes dairy butter are that he can feed his cows on the best foods, use more care and work with cleaner surroundings. A large proportion of creamery butter is not uniform, as the milk come from many sources, but dairy butter is injured in the churning and manipulation of the product by inexperienced persons.—San Jose Mercury.

Convincing Evidence That the U. S. is the Best and Most Popular Separator

ROCHESTER, MINN., Sept. 2, 1903.
I have handled the U. S. Separator for the past five years. The first year I sold about 46 machines. Looking over my books this spring, five years later, I find there are 30 out of the 46 sold the first year that have cost their owners *not one cent* for repairs during the five years they have run them.
Altogether I have sold about 270 U. S. Separators.
P. D. ANDERSON KEEL.

THE U. S. SEPARATOR PLEASES OTHERS AND WILL PLEASE YOU IF YOU WILL GIVE IT AN OPPORTUNITY.

If interested write for catalogue.

We transfer our separators from Chicago, La Crosse, Minneapolis, Omaha, Sioux City, Hamilton, Ont., Montreal, Sherbrooke and Quebec City. Address all letters to

Dairying in California

(Continued from first page)

lower room of tank house is commonly used, and if painted a light color, so it can be kept shiningly clean, is as good as any place on the farm.

The newly drawn milk should be poured from one bucket to another several times before being strained into the shallow pans. A simple form of aerator is made by driving holes with a sharp nail into the bottom of a ten pound lard pail and suspending it two or three feet over the pans, letting the milk drip slowly through the holes, this will remove animal odors and gas from the milk. Milk taints do not come through the body of a healthy cow, they are from without, so if the alfalfa flavor is rank in the milk, bring the cow up an hour before milking time and let her breathe off the odor. Then while milking should there be any droppings cover them promptly with either earth or better yet with gypsum, and use the aerator to run the milk over. If the temperature of the milk room is above sixty, the cream rises in 36 hours and should be skimmed, if it does not rise completely the milk room is too cool. Heating the milk room from 90 to 100 degrees before setting will overcome this difficulty. The milk is ready to skim when it has begun to thicken a little on the bottom of the pan, it is well to wait until this shows or there will be too much loss of butter fat. The cream should be thick, for as it has to be held until enough is gathered for a churning, so if it contains too much milk it will sour too rapidly and then taint, making the cream rank. When adding cream to that already gathered it should be stirred thoroughly and particular care paid that there are no dried particles on top. If there is any tendency to bitterness the temperature at which the cream has risen and been held has been too low and the skimming too long delayed. Years ago we made butter at Fresno without ice, during the hottest weather. We found that setting the milk in cans 24 inches deep and 16 inches in diameter gave good results, the can was straight sided and covered with a flat tin lid. They were placed in poverty coolers, that is one made of a frame covered with gunny sacks and lined with clean white muslin, a tin honey can with small holes in each corner was filled with water and let drip down over the sacking, cooling the contents by evaporation. It was then possible to make sweet clean flavored butter in the hottest weather, though not perfection, as it carried more butter milk than was consistent with long keeping. In using these poverty coolers, nearly everyone makes them too large, as they can only cool by evaporating a limited amount. One for each milk can and one for the cream was found to be right. In skimming the cream from these deep cans, a small conical dipper is used so as not to force the cream down into the milk. There are many mistakes in washing the daily tinware that is unnecessary labor. They should first be washed in cold water until all the milk is removed—this takes away the albumen and matter that hot water would cook on the tin. Wash in hot water and sal soda to remove any casien and also remove the more greasy cream. Soap and soapy powders have no place among the dairy tinware and often are responsible for much mischief. Then, last of all, fill the cans with clean scalding water and let them stand for a few minutes; wipe the outside carefully and turn upside down on a rack in the sunshine, where the air is fresh and sweet. By having a double set and using a second set in the morning—the washing can be done at one time. The articles used at night can be rinsed with cold water and left until next morning for the scalding. A small separator saves much labor and it is only a matter of time, until they are, like sewing machines, cheap enough to be indispensible.

The cream from pan skimming having already begun to ripen, no cream should be added within twelve hours of the churning time, or there will be great loss of butter fat. When the cream is ready for the churn it should have a granular appearance and a sharply acid flavor, yet the smell should be clean, not in the least musty or tainted.

Where the extra butter is a source of revenue a uniformity of flavor is desirable, it is obtained by ripening the cream for each churning to exactly the same degree of acidity. The Farfington alkaline tablets are simple to use and not expensive. The Mann acid test is also used and costs five dollars for the outfit, which is rather more than the most of farmers' wives feel like spending. Good dairy butter when first made should be low in flavor, but high in aroma, the full flavor developing slowly and in forty-eight hours the butter should be at its best, while a month should elapse before it is rancid. Here the private dairy has a distinct advantage over the large creamery, as the milk delivered to the large plant comes from many sources and in all sorts of conditions. In order to save the butter fat the cream is ripened to the wire edge, and it soon cries "Wolf" as the Germans say of the overtuned piano.

If the weather is cool it may be necessary to help the cream to ripen by heating it to seventy degrees; wrapping the can up closely hold it at that temperature six or eight hours, then it should be cooled to 58 or 60 degrees, before churning. Some good buttermakers churn at 45 degrees. Anywhere between that and 62 degrees will make a butter from which the milk can be readily washed. Higher temperatures than 62 makes oily butter with little grain, and the buttermilk retained between the globules will quickly make it rancid. Sometimes the cream swells and adheres to the sides of the churn, the butter refusing to come, by adding water at 60 degrees and letting the cream stand to settle, the gases will escape and the butter come readily. If this occurs often it is well to rinse everything in use in the dairy with lime water to disinfect it of bacteria. During cool weather small portions of the buttermilk from a previous churning can be added to the cream twelve hours before churning time. This is a good way to ripen the cream provided the butter is good and the buttermilk carefully kept from contamination with bacteria. There was an opinion at one time that the cream from different breeds of cows required to be churned at different temperatures, but it has been found to be a fallacy, that cream is cream, ripe cream will churn quickly when at the right temperate. When the butter is the size of uncooked grains of rice, stop churning and let the butter milk off, but not draining so closely however that the butter falls into a mass. Add cool salt water until the grains of butter float, turn the churn a few times, slowly, letting the water wash out the butter milk. Let off the first salt water and repeat, take up the butter and work it, salting to taste. After six hours we prefer to work it again and make up into squares. Mottled butter is caused by uneven salting and if the butter when taken from the churn is quite granular, the salt will penetrate evenly, sometimes if the salt is warm, say 76 degrees, it will cause mottles, but the second working usually removes these. If it is desirable to color the butter and it has been forgotten to put coloring matter into the cream, it can be mixed with the salt. The small white specks that sometimes appear are formed in three ways, the common one is not stirring down the froth or wind pudding, as the milkers call it, that comes on the bucket from rapid milking. Another cause for white specks is allowing the top of the cream in the can to dry into hard lumps. Then there are the particles of cheesy matter made by skimming too closely into the clabbered milk. Either of these last causes can be removed by straining the cream into the churn. Using parchment paper around the butter will keep it sweet much longer by excluding the air.

Well made butter finds its own market, and though we have not been in the butter making business for nearly three years, we are constantly asked to start again by our old customers.

While many of our customers were delightful people there was always a few hard to please and slower to pay. When the butter was as perfect as care and cleanliness could make it, it had then to run the chances of a dirty refrigerator, full of scraps from spoiling food and ancient odors that smelled to the high heavens. I wish some of the members of the Board of Health could follow the men that deliver butter, milk and cream for a week, they might learn that the dairyman was fully as clean as their mothers had taught them to be, or as housekeepers are at the present time. When there is an excess of milk for home use, it can readily be stored away in the form of cheese for future consumption. We have made many cheeses and do not consider the work as difficult as making a good cake. The Hansen rennet tablets for cheese making come in sizes for one hundred pounds of milk. For a family cheese we use 25 pounds of milk, this making a cheese weighing between two and three pounds. The morning milk is strained into the granite bread pan. If at 85 degrees a quarter of one of the rennet tablets dissolved in a little cold water is added. If the milk is below 85 degrees, warm enough of it to bring it up to that temperature. Cover the pan closely with a cloth and let it stand for an hour, when it will be ready to cut. Use a long bladed knife and cut into squares of about an inch in size. Cover for ten minutes, and then dip off the whey carefully as there is danger of disturbing the cream, and the more cream held in the curd the richer and mellower will be the cured cheese. Sometimes it is necessary to break the curd

LEWIS BRADBURY - DUARTE, CALIF.

the second time to liberate all the whey. When the curd is ready to be scalded it should look crumbly and grainy. Heat enough of the whey to 90 degrees to cover the curds, pour it over them, gently stirring until the whey penetrates all parts of the curds, repeat this with a second supply of hot whey after ten or fifteen minutes. If the curds are cooked enough they will squeak when crumbled between the fingers. Draw off the whey and mix in with the hands a heaping tablespoonful of salt. Wet a cloth in the whey laid over the hoop and pile the curds into it. The hoop we used is simply the section cut off a gallon tin can. Lace the hoop on a folded cloth and fold one over the top, then a piece of board and weigh with flat irons. After six hours double the weights, after twelve hours slip off the hoop, put the cheese into a fresh cloth, wet with clean water, turn it the other side up and put on the weights again for twenty-four hours, then take the cheese out of the hoop and put a cheese cloth bandage around it on the edge and rub it well with butter, put it well covered in a dry warm place to cure, turning and buttering it daily, and changing the cloths over it. There will be little dampness after the fourth day. Remember by keeping it well buttered the outside will not harden and crack open. The cheese should be thick rather than thin and not cut for eight weeks after making.

Devonshire cream is a simple dainty and yet commands a ready sale. It is made by putting a pan of milk on which the risen cream has not been disturbed, and is perfectly sweet inside, a large pan of wafer and putting them on the stove, heating it slowly to aid evaporation but not to boil. When the cream thickens it is folded over on itself like an omelette and slipped off on a wet cold plate, when chilled it is ready to be cut into squares and served with fruit or be eaten on bread, or used as a dessert with sugar and cream.

Cottage cheese made with clabbered milk by scalding we are all familiar with, from it can be made a little fancy cheese that is delicious. Rub the curd fine and put into small two-inch tin moulds a little at a time, then put in a layer of thick cream seasoned with white pepper and salt, then a layer of curd, until the mould is filled, press over night under a heavy weight. These sell well at ten cents apiece. A variation that finds favor at lunch parties is made by putting chopped caper with a dash of mustard into the cream layer, sometimes water cress is used. When ready to serve slip from the moulds and cut into large pieces, serving on lettuce leeves with mayonaise sauce made with olive oil and lemon juice.

The American people do not eat enough cheese, for it takes the place of meat and with a little bread and some green vegetable or fruit to add the water portion to the diet it furnishes all the nutriment required for even those who do hard physical labor.

SAWDUST LITTER.

An abundance of clean loose litter is a great help to the horses and cows to protect them from the stable flies. Another advantage is to keep stables clean and free from the pungent odor which attracts these pests. Fresh sawdust is the best litter. Oak and chestnut sawdust is better than pine, which is liable to give an odor to the milk. Sawdust is cool, clean and an excellent absorbent, and a slight brushing of the cows and horses soon frees the skin from and adhering fragments.—San Jose Mercury.

VALUE OF THE DAIRY INDUSTRY.

Dairy Commissioner Wright, of Iowa, in an exhaustive article on the subject of the Dairy Industry points out the fact that there is no one factor in farm operations that has done more to help out the farmers of the country than the dairy cow. Her importance is much greater than at first thought it would seem to be. The growth of the dairy industry in this country has been gradual but sure, and no backward steps have been taken. "Improved and better cows" have been the watchwords. Iowa's State Dairy Commissioner, H. R. Wright, points out that the largest single line of agriculture save one, is the dairy. Its products with a value of $590,000,000 is greater than the annual value of hogs sold in the United States, $500,000,000; it is greater than the value of all hay and forage, $484,256,846; is is greater than the value of all the meat cattle slaughtered, $419,455,200; it is greater than the value of all the wheat produced, $369,945,320; it is greater than the value of all the eggs and poultry, $281,178,035, and it has a value almost twice as much as the value of oats, $217,098,584; sheep, $300,000,000; barley, $41,631,762; rye, $12,290,540; rice, $8,000,000, and buckwheat, $5,747,853, of the United States. It far surpasses the value of cotton, $330,000,000, and is second only to the value of corn produced, $828,258,326.

Commissioner Wright, while correct in the main proposition, must not forget the great mortgage lifter—the American hog. He is the farmers' never failing friend.

KIND OF BEEF THAT SELLS.

The steer which is the most profitable in the market on the present demand for carcass stuff, says the Provisioner, is the fairly finished beast, whose interior is not padded and whose hide is not cushioned out with fat. The meat of the finished steer is "food fit for the gods" but the average consumer does not care to render fat or buy a steak which contains a huge filler of suet. He wishes meat, and his wishes create the market demand for beef. It is seriously asserted by those who ought to know, that the flavored highly fed beef is not so good as that of the naturally matured and comfortably filled carcass nor is it as nourishing, there being more stearin than casein or albumen and more insipidity than flavor in the former than in the latter viand. Let that be as it may, the present grade of good beef sells more rapidly and is more profitable to all concerned than is the meat of the highly finished prime beef steer. Medium grade beef is the kind which nature produces on the ranges and flavors with her grasses. The cottonseed meal and the corn man take it at this point and sweeten it. The hurried forced growth and fat-stuffing process of the finisher produces a young sappy flesh, which is largely devoid of that beefy flavor which the eater of beef desires. The medium finished carcass is not so costly to produce, hence it sells cheaper and better in the general market. For the special customer and the oleo renderer the fancy prime steer is a necessity. The great army of meat consumers seek the other class of animal, and that is the trade which moves the stuff.—Arizona Cattleman.

California has 298,898 acres planted to alfalfa. In point of alfalfa acreage it is the second state in the Union.

The man who beats a horse can be reached by the law, although too seldom does he meet with his just deserts.

The man who does not beat his horse and who forgets to water him for long periods does him an injustice almost as great.

MRS. A. BASLEY, ASSOCIATE EDITOR, PROSPECT PARK, CAL.

WILL APPEAR LATER.

I had intended writing on the work of bringing up brooder chicks, but the article is crowded out by answers to questions from subscribers, which have been unusually lengthy, so brooder chicks must be postponed a week. I would like to urge those who are just starting up their incubators for this season to have their thermometers tested, whether they are old or new, before commencing to incubate. It is a small thing to do, but a great deal depends upon it.

* * *

ANSWERS TO QUESTIONS.

Editor Cultivator:—Will you kindly answer the following questions in the columns of the Cultivator?

How much ground space is really needed on which to keep a hundred and fifty chickens? What kind of fixtures are the most suitable in the way of shelters, roosts, nests, and sheds? In fact an entire outfit needed for the above number of chickens? Will it pay to buy any of the prepared foods? If so, what kind? Is it advisable to feed rolled barley, particularly when fowls are moulting?—E. W. Taggart.

I would have to write a book to answer fully all these questions, I would advise you first to buy that excellent little book "Poultry West of the Rockies" from Henry Albers, 315 S. Main street, it will give you more information than I can put into the small space allowed in these columns. How much ground space is required for one hundred and fifty hens entirely depends upon your manner of taking care of them. I should say about an acre of land, but by keeping the yard exceedingly clean, constantly digging them over, giving the hens shade, and a good scratching pen, you can keep that number on a quarter of an acre. It all depends on you, how much real hard work you are willing to put in it, what you will do to help the hen in her efforts to make you money. But we will say that if you want to try on this small space. Divide the land into six pens about twenty-five feet by fifty feet in each. A house eight feet by ten for twenty-five hens to roost in, and a scratching shed pen about the same dimensions. The roosts for American breeds should be three inches wide, and should be removable to allow for cleaning them. Nests, I prefer the trap nests, but in any event the nests in this climate should be outside and away from the house the hens sleep in, this is on account of lice and mites. I find a moth ball in each nest a safe preventative. The scratching pen made of boards 12 inches wide, should be kept filled with clean straw or hay. All the grain food thrown into this hay and the hens kept busy all day long scratching and digging it out. This makes them lay more eggs as the exercise of scratching strengthens and develops the egg producing organs in the hens. Hens in this country must have shade as well as sunshine. If you have not trees or bushes you will have to provide shelter from the sun. You can drive stakes in the ground and make a frame work, on this lay palm branches or eucalyptus or any branches, even weeds will do. You can make cheap pens and cheap shelter in this way, or you can spend money in making good pens and build beautiful and costly houses, you must suit your own pocket book and your own taste in this. I can only give you an outline of what is needed In answer to what kind of food is desirable I would say a "balanced ration." You ask what is a balanced ration? and this brings me to your question will it pay to buy any of the prepared foods, if so what kinds? The prepared foods are "balanced rations," and it will most decidedly pay you to buy them, follow exactly the directions of the makers for feeding them. What kinds? I have used and am using the feeds sold by the houses which advertise in this paper (see ads in the Cultivator). These "balanced rations" are made up of many different grains ground and mixed and animal food, charcoal, and grit added making a food which when analyzed shows the same elements as an egg. It really is putting into the egg machine (the hen) the proper material for forming an egg, and if your machine (the hen) is bright, clean and in good running order (healthy) by using balanced rations you cannot fail to get eggs. Rolled barley is good for fowls, I feed it once a week. I prefer wheat to any other steady diet, but prefer a variety of grains, and I feed a great deal of green food, clover, lawn clippings and alfalfa, lettuce, cabbage, beets, etc. If you intend going into the poultry business, come out to Prospect Park, near Hollywood, and see my ranch, it will help you, and I am always willing to answer questions and gladly give pointers on the chicken business.

* * *

One Form or Roup—I would like very much to know what is the matter with my chickens, also what I could do for them if anything could be done. A swelling comes on one side of the head in front of the eye, and then a yellowish white growth comes over the eyeball, from the front inside of the eyelids. In a few days the other side begins to swell in the same way. They rub the eye a great deal, so there must be some irritation. The eye waters somewhat, but the nostrils are clean and there is no discharge from them. The fowls seem to be in good health otherwise. In the past week I have had two such cases. The first one I kept cooped up away from the other chickens for a few days and saw that the other eye became affected the same way. It got no better so I killed it. But the other I killed as soon as I noticed it, because I was afraid it was contagious. I never saw anything like it before among my chickens. Please answer through the Cultivator.—A Subscriber, Pomona.

What you describe is one form of roup and as such is contagious. Dr. Salmon, in his valuable book on diseases of poultry, gives the following description and remedies to be used: "Roup is a contagious disease, which is localized upon the mucous membranes of birds. That is, the microscopic parasite which causes the disease, develops and multiplies upon and within the mucous membranes of affected birds; escapes from their bodies, with the discharge from nostrils and eyes; soils their feathers and also the litter and other objects about them; when dried it is dissipated through the surrounding air, in the form of dust by every movement of the bird or of the soiled objects, and by every breeze that disturbs the contaminated surface. This dust, containing the germs of the disease, as it floats into the air is drawn into the nostrils with the breath or lodges within the eye. When the germs reach the moist and warm surfaces of the membranes lining the nostrils or eyes, they find favorable conditions for their continued multiplication. They penetrate the membrane, set up irritation and inflammation, and as a result there follows catarrh, ulceration, and the formation of purulent and cheesy deposits about the head.

Treatment—If the disease appears use disinfectants freely and isolate diseased individuals. Antiseptic and healing applications are indicated to the interior of the nostrils the cleft of the palate, the eye and other affected parts. If swelling containing thick pus or cheesy matter form upon the head, they should be opened with a sharp instrument, the contents removed, and the wound treated with antiseptics. Antiseptic powders such as iodoform and aristol are convenient for wounds. Antiseptic solutions may be injected into the nostrils and into the cleft n the roof of the mouth which communicates with the nostrils by using a small syringe or even an oil can such as is used for oiling machinery. The solutions most suited are boric acid fifteen grains to the ounce of water (half teaspoon to half cup A. B.); carbolic acid and two per cent. solution; peroxide of hydrogen diluted with an equal quantity of water; permanganate of potash one grain to the ounce; or sulphate of copper, five grains to the ounce. Some persons have reported success from the use of coal oil (kerosene) either pure or diluted with equal parts of olive oil keep the birds comfortable and free from draughts. Give stimulating and easily digested food, containing small portion of meat scrap. It is important to dispose of the carcasses of dead birds promptly by burning or deep burial."

I have quoted at length from Dr. Salmon, as he is the great authority on chickens' diseases, being employed by the government as expert for that purpose. You cannot do better than follow his advice, but in addition I would strongly urge you to do as I have already advised, keep blue stone (sulphate of copper) in the drinking water of your fowls, sick or well. It is a well known disinfectant, a slight tonic, very cleansing and healing. All of the roup cures that have to be placed in the drinking water have the stone as the foundation. Blue stone and permanganate of potash mixed are

* * *

Chicken Pox—Will you please tell through the columns of the Cultivator what to do for chicken pox. Our chickens have little sores on their heads, both old and young are affected, they are otherwise in good condition. Fed on barley.—W. T. W., San Dimas.

Chicken pox, sometimes mistaken for warts on the head, is not usually a dangerous disease, it will kill off young chicks quickly if neglected. It can easily be cured by greasing the spots with carbolic salve or carbonated vaseline twice a week. They will heal up in ten days or less. Or you can bathe the heads in warm soap suds, and afterwards in a solution of sulphate of copper (blue stone) a teaspoonful to half a pint of water.

Chicken pox is very infectious, the premises should all be thoroughly disinfected by spraying with the kerosene (or distillate) emulsion to which has been added five per cent of crude carbolic acid. The feeding troughs and drinking vessels should be daily washed in boiling water.

THE ADVANTAGES OF FARM LIFE.

It is the farmer's boys who are most likely to succeed, whether in business or in professional life. Spending most of their time under the open sky, breathing fresh air and eating simple food, they are more likely to have vigorous health and strong constitutions than are their city cousins. Brought into constant contact with nature, they absorb a great deal of useful knowledge and acquire habits of observation Then, too, the regular farm work, the "chores" and numberless other little things keep them well occupied and enable them to feel that they are earning their way, thus giving to them a sense of independence and cultivating a spirit of self-reliance and manliness.

The performance of a deal of drudgery is an indispensible preparation for all real success in life, whatever the occupation. A boy who is afraid of work or of soiling his hands need not expect to accomplish much in the world. Country boys have their full share of fun, but there are many disagreeable duties on a farm which farmers' boys learn to accept as a matter of course. Edward Eggleston, speaking of the value of his farm training when a boy, once said to me: "I learned one thing of great value, and that was to do disagreeable things cheerfully."—February Success.

ANSWERS TO QUESTIONS.

Do you consider the Douglas mixture good for moulting hens? Please give the receipt for it.—J. F. Y.

Douglas mixture is a first class tonic, and if used judiciously as such is of extreme value in the poultry yard. It is made thus:

Sulphate of iron ½ lb.
Sulphuric acid 2 oz.
Water 2 gals.

The acid must not touch the flesh or clothing, at least not until diluted. The easiest way is to omit the water at the drug store and add some warm water after you get home.

Dose, a teaspoonful of above to every quart of water used for drinking by the fowls: The drinking vessels while using this tonic must be of glass or glazed earthenware.

A BOY POULTRY RAISER.

Walter V. Howe, of Omaha, Neb., is cutting quite a figure as a successful young poultry raiser. He is but thirteen years old, and, according to his own statement published in the Nebraska Farmer of June 4 last, he is successful to a very high degree. Walter caught the chicken fever last fall, when he and his chum went into business together, visiting the commission houses and buying chickens until their money ran out. The back yard of Walter's home was to furnish the accommodations for the new business. The first two or three weeks things went along swimmingly, and the young business men could see immense profits piling up in the prospective. As time went on Walter's chum proved a poor business partner, Walter doing all the work. A dissolution of partnership was thereupon agreed to and each took with him the chickens that he had bought. Since January 1 last Walter has been conducting business on his own hook. He says he now has twelve non-Union hens and one rooster, a mixture of Plymouth Rocks, buff Cochins, Brahmas, and three bantams. He has thirty-two young chickens, with a hen due to hatch in a few days. He has kept an accurate account of his receipts and expenditures since January 1, showing that he has gathered 681 eggs, a large number of which were sold at 25 cents a dozen. He has disposed of some of his hens and bought better ones, and has cleared $6.15, besides having had lots of fun and learn something. Walter says if there is a boy in Nebraska that can beat his record he would like to see the color of his eyes and have him tell when, where and how he did it.

We would prefer a small flock with plenty of room to a flock of the best layers in the world which is crowded.

There is greater activity in the poultry business just at this time than ever before. The business is growing by leaps and bounds.

The eighth annual exhibition of poultry, pigeons, cats, dogs, and pet stock, under the auspices of the National Fanciers' and Breeders' Association of Chicago, will be held January 25th to 30th inclusive, A. D., 1904.

Poultry believes in reciprocity. If you will give them care and attention and the right kind of feed, they will return the favor by giving you lots of eggs.

Do not think you can make money out of poultry without putting time, energy and earnest thought into it.

The best preventative of roupe and other infectious diseases is perfect cleanliness about the poultry house and ground. No medicine can successfully combat filth, darkness and dampness.

Feed the hens the best when they lay the fewest eggs. If they are moulting they need heavy feeding to help them to a new suit and if they are not laying it is because they are not properly fed.

Do not forget to store some dry earth for winter use in the dust boxes. We like to use road dust, but if this can not be had we have found garden soil, dried, equally useful.

FLORICULTURE AND GARDENING

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

STREET TREES.

A Pomona subscriber regrets that his district is planted with about a dozen sorts of street trees and wishes to know what are best for the purpose, that he may work for uniform planting.

Although the subject of street trees has been very fully covered in this department several times, the season for planting is close at hand and the question may be profitably discussed at this time.

First, it was with regret that the writer saw in a daily paper the intention of the Highland Park Improvement Association to plant the Monterey Pine (Pinus radiata) on some of its streets. Conifers or cone bearing trees should, at all times be allowed to retain their branches to the ground, and this is impossible along streets unless a space of at least twenty feet is left between sidewalk and curb. Trimmed up in the ordinary street fashion, the Monterey pine is a sorry looking object. Our best writers on the subject have for years been trying to educate the public regarding the proper treatment of conifers, and it is strange that a live community like the above should err in this direction.

The uniform planting of street trees is dependent for success upon co-operation. The residents upon a certain street should vote upon a street tree and the kind receiving the largest number of votes should be used. Some are bound to be disappointed, but should gracefully yield to the majority. All streets should be planted with but one sort of tree to each street and it is best to plant the principal street, and those parallel with it, entire, and then let the cross streets be planted afterwards. A bridge or some other radical break in the continuity of the street is the only excuse possible for changing the sort of tree. It will pay in the end, if streets have been planted with a mixture, to take out all the odd ones, no matter what the size or age and replant. All the property on that street will have the value increased by such a method. No finer landscape effects are to be gained in a town or city than by having long lines of trees of but one sort. A street so planted may be likened to a garment of but one kind of cloth, while the mixed planting has the effect of one made up of cloths of every conceivable color, size and texture.

The writer's favorite street tree is the Victorian Bottle Tree (Sterculia diversifolia). It has been closely watched for several years past and stands well the test of time. The one illustrated stands in Pasadena, where the tree is much used. On the car line running up to Altadena may be seen various kinds of street trees, perhaps more than a dozen sorts, yet the Bottle Tree looks and grows best of all. It is one of the cleanest of trees, of a bright, pleasing shade of green, the trunk is straight and mast-like, the branches are not far reaching and therefore not liable to injury by wind, needs little, if any pruning; it is a fast grower when well supplied with water, yet noted for its drought-resisting qualities. Its general outline is well-nigh perfect, its carriage graceful, it does not grow so thick as to harbor dead leaves and rubbish, yet enough to cast all needed shade, seldom does one make abnormal growth and it will not injure the sidewalk by upheaval of the soil. What can surpass it in number of points.

The tree most used in California for street planting is the Blackwood (acacia melanoxylon) though in the writer's estimation is neither second or third best. There are other acacias that far excel it, yet some streets should be planted with it. Acacia floribunda of the trade are A. retinodes floribunda of the botanist is a most excellent tree and improves with each year of growth.

Ceratonia Siliqua, the Carob Tree or St. John's Bread is a most excellent tree and one that will steadily grow in favor. Nothing but its scarcity has ever been urged against it and as it is a very fast grower, a town or community might grow their own supply.

For a deciduous tree, the pecan has been growing steadily in favor for several years, and the Texas umbrella should appear in every extensive planting.

Some of the streets should be planted to palms, to gain variety, and for this purpose the Chinese Wind-mill palm (Trachycarpus excelsus) is the best, for several reasons. This palm is known to nurserymen in general as the Chamaerops. Where the soil is well drained to a considerable depth the so-called Dracenas (Cordyline indivisa

Sterculia diversifolia

and C. australis) are fine for palm-like effect.

Grevillea robusta is an excellent tree for dry localities, but is much objected to for its disgusting habit of dropping leaves each month of the year. Then, too, the wood is brittle and they will require pruning each year.

Our list might be extended to a great length but the following, in the order of their desirability, would give sufficient variety for any community: Platanus orientalis, the palm tree (deciduous); Acacia's Mollisima, dealbota decurrens, cyanophylla, longifolia, and neriifolia, Pittosporums eugenioides, lenuifblium and undulata; Lagunaria Patersonii; Ligustrum lucidum, at least three species of eucalyptus: rudis, polyanthema and ficifolia; but not the one most used, E. robusta. A tree much like the latter in appearance, but superior for street purposes, is E. calophylla.

It is not generally known that our live oak (Quercus agrifolia) is a most excellent street tree, for few have given it a trial, but it will grow from ten to twenty times as fast in cultivation as when left to chance and when of a suitable size would easily stand at the head of the list. Mr. Abbot Kinney, who has experimented with them for a number of years, states that fair sized young trees are quite easy to transplant. Where available, one street at least in every community should be planted with them.

POT FLOWERING PLANTS.

The soil for most flowering plants should not be too rich, and to induce plants to flower well it is best to let them become pot bound. There is a natural law that when plants find they cannot continue to grow, they always endeavor to reproduce their species, which is by flowering and producing seeds. Experienced gardeners take advantage of this law and starve their plants after they have made a fair growth. This always induces them to flower much more profusely than if kept growing all the time.

To this end, all flowering plants should be grown in as small pots as possible, for instance, cinerarias or geraniums are better in 5 or at most a 6-inch pot than in any larger sizes. Ferns, palms and other foliage plants should also be grown in small pots, but since they do not flower, we cannot practice the starvation process on them, but when they have filled their pots with roots, a little nitrate of soda given in homoepathic doses occasionally will be beneficial to them.

BIG SUGAR BEET RETURNS.

At Los Anamitos about 47,000 tons of beets have been sliced and 11,000,000 pounds of sugar sacked thus far this season, and within a radius of five miles in all directions of the factory the farmers have been busy for months delivering their crop. The disbursements the 15th of this month for September delivery of beets amounted to upwards of $78,000 and for the season the payments amounted to over $175,000 for beets alone.

Prosperity prevails amongst the beet growers this year and this augurs well for the coming season.

THE BOYS ARE ALL RIGHT.

Mrs. Belle A. Matthews of Santa Ana writes for a copy of the Cultivator which had been lost, and says: My boys would sooner lose a meal than go without the Cultivator.

Those boys will make good farmers. Watch them.

The growers of wine grapes at Geyserville and Healdsburg are taking steps to organize a growers' association. They propose to establish their own wineries and they are much dissatisfied at the prices of grapes fixed this year by the wine manufacturers.

Another meeting of poultrymen has been held at Santa Rosa to consider ways and means of organizing the poultry raisers in Sonoma county into a co-operative association. This far the effort has not been enthusiastically received, especially by the Petaluma poultrymen. At a late meeting W. J. Curtis said: "The advantage of co-operation is that it eliminates the commission men." He cited a case that one rancher had saved $8.00 on thirteen cases of eggs by dealing through the co-operation.

At this writing the San Francisco game market is in a muddle. Several lots of wild ducks were confiscated, and there is a large quantity on the dock, uncalled for, as dealers are in fear of arrest should they accept lots of more than fifty each. Poultry prices are down, mainly because so much has been shipped in from the east.

The announcement is now made that as a result of the serum tests cattle are going blind in Contra Costa county. On one little ranch twelve cows have gone blind. The owner believes his misfortune is due to the squirrel serum. The farmers are afraid the horses will be next infected.

The poultry market in San Francisco has been dull since the game season opened, October 15. At this writing the market is glutted with wild game. About four carloads of poultry from the east have been arriving for some time.

An' Ah will see yo' froo."
Yo' keep a-peggin' 'way
An' jes' be good an' true;
Be suah yo' don't forgit to pray,
An jes' yo' keep a-peggin' 'way—
De Lawd'll see yo' froo.
—Frank A. Marshall, in Lippincott.

GOING HOME.

Williams, of Arizona, was down on his luck. He had been five years in the gold territory, and had confidently looked forward to each succeeding year, enabling him to go back home and make things comfortable for the woman and little ones. But each succeeding year had found him precisely where the previous one had left him—a sanguine prospector, with a wealth of hope and a pitifully small outfit. He had frequently struck promising veins, and had hurried to his tent to write glowing, exultant letters to the woman who was waiting for him, but somehow the claims had always petered out prematurely.

But this last find had been different. He had taken out sixty dollars a day for a week, and with this substantial evidence of coming prosperity had written a letter which filled the far-away home with sudden joy. Then the vein had disappeared, and he had picked and shoveled and hauled away dirt until his money was exhausted. But the gold was there—he was sure of it, and his confidenie induced the trader at Three Forks to advance him funds. However, there had been a shaft to sink, and solid rock cut through, and it had all been expensive. When it was accomplished, the money was gone and there was no vein.

He was still confident, but the trader was angry, and had accused him of false pretenses. Only this morning he had received intimation that the sheriff was about to levy on his mine, his "Molly," named after the dear one it was to do so much for. He was a strong man, hardened to ordinary weaknesses, but as he sat there on the rough boulder tears began to drop from his eyes and roll down his bronzed, bearded face.

He was aroused by approaching footsteps. When he looked up two men stood before him. One of them was the owner of the adjoining claim; the other was the sherin.

"I have come to—" began the officer.

"Yes, yes, I know." Williams rose heavily to his feet. "It's all right, Just go ahead. I can do nothing."

The sheriff looked at him curiously. "Oh, 'tain't quite so bad as that," he laughed. "I did 'low on makin' a levy, but Kansas here has been tellin' me something that has changed my plans. You needn't bother about that jest now."

"I s'pose ye heerd 'bout my luck?" Kansas asked blandly.

"Yes." Williams looked at him stolidly, Kansas was a person of established shiftlessness, and yet only a few days before he had struck it rich, and was now a man of wealth and consequence.

"I've got a pretty vein," Kansas went on frankly, "but it dips to'ards you un's land. If thar's a pocket I 'low hit's acrost your line. I don't s'pose ye'd be willin' to sell out clean, but if ye'll go pards I'll give ye ten thousand for a half share." He waited a moment, but, as there was no reply, added: "I'll make hit twenty for a clean job, but of course ye won't quit?"

Williams looked down into the valley and up the mountain, and then across to the east, where the sun was just rising above the pines."

"Yes, I'll quit," he said huskily, "You can buy me clean out—I'm going home."—Frank H. Sweet.

DON'T WAIT FOR THE FUNERAL.

"If folks could have their funerals when they are alive and well, and struggling along, what a help it would be!" sighed Aunt Jerusha, folding her Paisley shawl with great care.

"Now, there is poor Mis' Brown," she added, as she pinned her Sunday bonnet into the green veil. "How encouraged she'd have been if she could have heard what the minister said today. I wouldn't wonder one mite if she'd got well. And Deacon Brown a-wiping his eyes and all of them taking on so. Poor soul, she never dreamed they set so much by her.

"Mis' Brown got discouraged. Yer see, Deacon Brown he'd got a way of blaming things onto her. I don't suppose the Deacon meant it, 'twas just his way, but it was awful wearing. When things wore out or broke, he acted just like he thought Mis' Brown did it on purpose, and they all caught it like the measles or whooping cough.

"And the minister a-telling how the deacon brought his wife here when it wasn't nothing but a wilderness; and how patiently she bore hardships and what a good wife she had been. Now the minister wouldn't have known anything about that if the deacon hadn't told him. Dear, dear! If he'd only told Mis' Brown herself what he thought, I do believe he might have saved the funeral.

"And when the minister said how the children would miss their mother, seemed as if they couldn't stand it, poor things. Well I guess it is true enough. Mis' Brown was always doing for some of them. When they were singing about sweet rest in heaven, I couldn't help thinking that was something Mis' Brown would have to get used to, for she never had none of it here.

"She'd have been awfully pleased with the flowers. They were pretty, and no mistake. You see, the deacon w'n't never willing for her to have a flower bed. He said 'twas enough prettier sight to see good cabbage a-growin,' but Mis' Brown always kind 'o hankered after sweet smelling things, like sweet peas and such.

"'What did you say, Levi? 'Most time for supper? Well, land sake, so it is! I must have got a medatating. I've been thinking, Levi; you needn't tell the minister anything about me. If the pancakes and the pumpkin pies are good, just say so as we go along. It ain't best to keep everything laid up for funerals."—Aunt Jerusha in New York Herald.

APPRECIATION.

There is so much in appreciation in this world; not that people need flattery, but a just recognition of what they do. It makes life's burdens a good deal easier to bear if we drop a word of encouragement, now and then, to those who we know are working under difficult conditions. It matters not whether man or woman, the value of an encouraging word is seed sown that will grow luxuriant plants, which blossom into flowers by and bye.

As a general thing it may be said, with truth, that women need kind words, and words of appreciation oftener than men. Their work is of a more nervous character. Their organism more sensitive and susceptible to depression, therefore easily affected by pleasant suroundings and kindly expressions, or words of appreciation —or the reverse.

It costs so little to speak gently to the tired wife; to notice what she has done and commend her work. Half the worry has gone out of the day when, at night, she pillows her head with a pleasant thought of some word of affection, carelessly dropped, by the one from whom appreciation comes with greatest delight.

"So often the lines of the sad face relax,
And the eyes grow bright
With a tender light,
From a word that is fitly said."

We ought not to wait until those we appreciate are gone from us to express our value of their worth. It matters little what we say or do when so called death closes the eyes and ears of our friend or companion. What he or she wants are kindly words while they are here. Well did Ingersoll express the thought, when in that beautiful oration he declared, "Praise and blame fall alike unheeded on the cold and pulseless ear of death."

And then, too, how great will be our comfort as we stand by the bier of the loved one who has gone away, to think, "I did what I could" to smooth the rough pathway in life's uneven journey.

And in the coming of that brighter day, when companion's congenial here, shall meet in the spheres above; when families shall be re-united to separate no more; when the good and the beautiful shall come into our being, in that proportion which our lives here warrant the inflow of the divine thought, for "as we sow so shall we reap," how grand will be the mutual greeting, as softly falls upon the ear of the soul born into spirit life, the loving welcome of the dear one over there. Kindness, thoughtfulness, appreciation of one another, and above all little words of affection are jewels which shall flash with a radiance beyond description, in the future crown of the man and woman who send them forth on their mission of love to bless and encourage a tired heart.

So let us cultivate the habit of appreciation and of recognition of the good in others, for by so doing we add blessings to their lives and happiness to our own now and hereafter.

How aptly does Ben King express this thought in the following beautiful poem:

"If I should die tonight,
My friends would look upon my quiet face
Before they laid it in its resting place,
And deem that death had left it almost fair;
And, laying snow-white flowers against my hair,
Would smooth it down with tearful tenderness,
And fold my hands with lingering caress—
Poor hands, so empty and so cold tonight.

"If I should die tonight,
My friends would call to mind with loving thought,
Some kindly deed the icy hands had wrought;
Some gentle word the frozen lips had said;
Errands on which the willing feet had sped;
The memory of my selfishness and pride,
My hasty words would all be put aside,
And so I should be loved and mourned tonight.

"If I should die tonight,
Even hearts estranged would turn once more to me,
Recalling other days remorsefully;
The eyes that chill me with averted glance
Would look upon me as of yore, perchance,
And soften, in the old familiar way;
For who could war with dumb, unconscious clay!
So I might rest forgiven of all, tonight.

"O, friends, I pray tonight,
Keep not your kisses for my dead, cold brow—
The way is lonely, let me feel them now.
Think gently of me; I am travel-worn;
My faltering feet are pierced with many thorns.
Forgive, O, hearts estranged, forgive, I plead!
When dreamless rest is mine I shall not need
The tenderness for which I long tonight."

"The Quality Store."

TOP COATS

These cool nights make a man feel the need of a top coat. We are ready for you with a bright new stock of the very latest styles and patterns approved by good dressers. Come see them and try on a few. We can please you, without doubt. Prices range from

$10 to $42.50.

Fall Suits, $10 to $40

Mail orders carefully filled. Self-Measurement Blanks free upon application.

First and Spring, Los Angeles

YOU BROUGHT ME FLOWERS.

You brought me flowers! Blush roses, three,
  Not guessing all they held for me;
The day was dark, and I alone;
  Life sang to me in monotone,
While every hope afloat at sea
  Seemed wrecks upon the sands to be;
While chilly winds were making moan—
  You brought me flowers.
As 'twere love's mantle overthrown
O'er all the sky a radiance shone;
Hope swung her snowy canvas free;
Because, because, dear heart, you see,
When I was aweary, sad, and lone,
You brought me flowers.
—Mrs Sarah Wolverton.

A Short Love Story.

"Ralph, am I going to die?" asked Norman Bradford, in a weak voice.

Dr. Adair's keen black eyes suddenly dimmed as he looked into the face of his friend. His voice was husky as he tried to answer cheerfully:

"My dear fellow, while there is life there is hope."

"Ralph, your reply is evasive. I must know the truth. Can I live?"

For a moment the physician's lips quivered. His heart was touched. He took his patient's hand as he said, tremulously:

"No, my poor fellow, your hours are numbered."

"I thought so," calmly returned the sick man. "Call Bessie, then kindly leave us together for a while."

The doctor left the room, and soon a pretty girl, with large blue eyes, entered.

Do you want me, Guardy?" she asked in low, sweet tones.

"Yes, Bessie. Close the door, please, and come to me."

She obeyed. When she had reached his bedside Norman took her hands in his feeble clasp.

"Bessie, the doctor says I am dying. You are poor, and when I die will be friendless. I want you to inherit my wealth. There is but one way in which you can do that without reproach, dear—you must become my wife."

The girl literally held her breath. How was she to answer him? Once, twice, she essayed to speak, but, though the lips moved, no words came.

"It will be only for a few hours at most, Bessie," the weak voice went on, "and it will comfort me inexpressibly to know that I leave you provided for."

There was not a word about love. Bessie looked searchingly into the pale face, and her own color faded.

"I cannot," she said. "But—Oh, dear friend, it is hard to know that I must lose you."

So Bessie Graham knelt by the supposed death bed of her guardian, while the minister, who had been quickly summoned, spoke the words that made them husband and wife.

Bessie was an orphan. When her father died he left her—then a child—to the care of Norman Bradford, his esteemed and trusted friend, and most faithfully had that friend discharged the obligation.

Bessie's scanty fortune had been sufficient to educate her; but now the last dollar was spent and she was dependent on her guardian for support.

As child and maiden she had looked up to him as her dearest friend. Now that he was dying and wished her to be his wife, she never dreamed of opposing him; his wish was her care. Her tears fell fast as she knelt there.

* * * * * *

With the last words of the ceremony the close clasp of his hand relaxed, and she thought he was gone. But he was not dead; only sleeping.

Dr. Adair shook his head as he examined his patient's pulse and said he could not possibly survive the night; but he was mistaken; the morning brought a decided change for the better. It was even possible that he might live.

Bessie watched over her husband faithfully. She could not have been more watchful for his comfort—more solicitous for his recovery.

But as the weeks passed and Norman slowly struggled back to life she began to avoid being left alone with him. He noticed the change and it troubled him greatly.

"She does not love me and regrets our unfortunate mariage," he thought, sorrowfully. "It is more than I can bear! Why did I not die? Death would have been preferable to this torture.

"I cannot endure it—I cannot. I must go away."

So the next morning, before Bessie made her appearance, Norman left the old home and went to the city, some twenty miles distant, for the purpose of making arrangements with his lawyer, who resided there, for his wife's support. As yet he was undecided what his next step would be.

When Bessie went to breakfast she was surprised to find a note beside her plate. She hastily tore it open and read:

"Dear Bessie—I am going away. Forgive me that I did not say farewell. I dare not meet you again. Forgive me, too, for the wrong I did you in asking you to marry me; had I dreamed that my life would be spared I never would have fettered you so. But Ralph said I had but a few hours to live, and, before heaven, I believed him.

"You have borne it patiently; but trust me, Bessie, you shall be free again. I claim nothing of the past, and I can restore to you the future. Two years must elapse, however, before we can obtain a legal separation.

"I wish you would stay in the old home with your faithful servants until other arrangements can be made. Just now I am too mentally shattered to think of our future. It will be best for you not to write to me; what comfort would your letters be to either? You cannot love, and I must have your love or nothing. Yours ever.—Norman Bradford."

For several minutes Bessie sat staring at the words before her, her breath coming in short, quick gasps. Then she rushed down the stairs and almost into the arms of kind Mrs. Powell, the housekeeper, who had been a mother to the orphan since her guardian's home had been her abiding place.

"Auntie, please tell me where Norman is?" she pleaded. "I must go to him."

"But, dearie, why the need? He has only gone to see his lawyer, Mr. Latimer."

"Oh, you don't understand. He has left me forever'" Said Bessie, with glowing cheeks and sparkling eyes. "I love my husband with all my heart and strength, and he must know it' I must go—it would kill me to stay here."

In an incredibly short time the excited girl was ready for her journey, and the day was not far advanced when she found herself at the law office, where she learned that Norman had been too ill on his arrival to transact business, and Mr. Latimer had taken him home with him.

Bessie entered a cab and was rapidly driven to the lawyer's residence. She was shown to the room which had been prepared for Norman's exclusive use. Here, on a sofa, she found him stretched, motionless, with closed eyes, as though asleep.

She quietly advanced until she stood beside him.

Suddenly the gray eyes opened, and Bessie, with a broken sob, flung herself by her husband's side, and was gathered to his breast in an ecstacy of passionate joy.

"Am I dreaming?" he said huskily, "or is this indeed Bessie Graham?"

"Not Bessie Graham, dearest Norman, but Bessie Bradford, who has come to tell you that she loves you with all her heart' Oh, Norman, we have both suffered unnecessarily. I thought you married me for pity, not for love, while I—well, I must have loved you always, I think."

"My precious wife," You have given me back my life," cried her husband.

And Bessie, meeting the gaze of his love-lit eyes, no longer doubted his love.—Yonkers Statesman.

WRITE DIRECT TO BAY VIEW.

Editor Cultivator: Will you please tell me through the California Cultivator where information can be obtained about the Bay View Reading course for literary clubs? It is frequently mentioned in the papers and seems to be in much favor. If you could give some description of it in the California Cultivator, I feel sure it would be, just at this time, a real favor to many others who may be looking for plans for a literary club.—Etta MacFarlane, San Francisco.

The Bay View Reading course embraces a regular literary and scientific programme laid out for several years work for individuals or clubs. The books furnished by the association are exhaustive and valuable as authorities on the subjects treated of. The best way to secure the desired information regarding the course is to write to the Secretary of the Bay View Reading Course, Bay View, Michigan.

Recipes...

Apple and Rice Compote.—Make a syrup of a cupful of sugar and half a cupful of water. Drop into this medium tart apples pared and cut into quarters. Lift out when they are tender but unbroken, then add to the syrup a little stick cinnamon, or orange peel, and cook until thick and rich. Have a mold or baking dish lined with steamed rice; into this place the apples and strained syrup, and cover with a slightly brown meringue.

Apple Butter.—Boil fresh cider down to one-third. To every gallon add three quarts of apples, not too sour, pared and quartered, one teaspoonful ground cinnamon, a quarter of a teaspoonful of ground mace, and three cupfuls of sugar. Stew carefully so that it does not burn, and stir often. When very thick and smooth remove from fire. When cold put in stone jars.

Apples en Surprise.—Take large baking apples and cut off a slice from the blossom end. Scoop out part of the inside and fill the apple shells with a mixture of sliced bananas, seeded raisins, chopped nuts, a little grated lemon or orange peel, and sugar to taste. Replace the slice cut from the top, and bake slowly with a little water in the pan.

Cider Apple Sauce.—There are two ways of making this. One is to boil the cider down to a third, and then cooking in it pared and quartered sweet apples. This is to simmer for several hours, being almost constantly stirred, and when thoroughly soft and of a rich brown color, it may be canned or simply cooled and packed in jars. It differs from apple butter in that it is made from sweet apples, and that no sugar or spices are used. The other process calls for dried sweet apples. Boiling the cider down to half will be rich enough for this, as the dried apples are much richer than fresh ones, and besides the mixture will need longer cooking, which also adds to the richness. Stir very often, to prevent burning, and when done simply put in jars.

Apple Shortcake.—Stew some good cooking apples in as little water as possible, and press through a colander while warm. Add to a pint of this half a cupful of sugar, one teaspoonful of butter, nutmeg and cinnamon to taste, and a little grated lemon peel. Have ready a good shortcake, made in two layers and buttered; spread with the apple, lay the other piece on and serve with sugar and cream.

OILY HAIR AND DRY HAIR.

If your hair is oily or full of greasy scabs, wash it every morning with tar soap. After this, dry it thoroughly, and then rub with a small sponge saturated with the following mixture: Distilled tar-water, two hundred and twenty-five grams; chlorate of potash, seven and one-half grams, liquid ammonia, three grams.

After spreading it out at night, powder it well with the following powder: Salicylic acid, four grams; hydrochlorate of pilocarpine, two grams; powdered sulphur, twenty-four grams; borax ten grams; starch-powder, twenty grams; talcum powder, one hundred and forty grams.

If, on the other hand, your hair is too dry, brittle, and your scalp scaly, you must first wash your head with a decoction of soapwood, and then apply some of the following pomatum. Vaseline. forty grams; lanoline, twenty grams; birch-oil, four grams; borax, two grams; esence of sandal, twenty drops.—Woman's' Home Companion.

A FEW FACTS ABOUT SILK.

There is but one paper in the United States published in the interests of silk production, yet we, as a people, use more silk than any other nation in the world, next to China. Although we use a vast quantity we produce little, yet there is not a region of country on earth that can produce finer silk, nor so many crops of silk in a year, as this country can. There are now more than nine hundred silk factories in the U. S., and the statistics of this year show that we have imported no less than $50,000,000 worth of silk, reeled and raw, to keep these factories going.

The demand for silk is on the increase all the time.

In Georgia and North Carolina the people are working up to this very important industry. The State Agricultural Commissioners are helping them, as also the wealthy citizens. They have organized "The Silk League of America" in Georgia, and have already put in 1700 acres of mulberry trees in one locality, besides many other smaller tracts in other localities. The League has secured one of the two silk reeling plants that the Agricultural Department brought over from France and have sent their first skein of reeled silk to Washington. Their monthly paper, "Silk," not yet a year old, has a circulation of 10,000 copies. This fact surely shows a lively interest in the silk business. Yet with all this manifest pluck and enterprise they have as yet a silk season of only six weeks to go on. They are still operating on the old Italian methods, never having ventured out on the higher plane of raising several crops a year. Italian experts tell them that the mulberry tree will not live if its leaves be taken more than once a year; so without testing the matter they take it as a fact that the silk season is only six weeks, just as it is in Italy and France.

Since the multicanlis fever (as the silk rage of fifty years ago is called) there never has at any time been so much interest manifested in the silk business as at the present time. All classes are beginning to enquire, "Why do we send out of the country for $50,000,000 for an article that we can produce at home?"

Certain facts are fully established in this business. First we have a much larger acreage to select from that will produce the mulberry tree than any country where silk is produced. Second, our soil is as good and will produce as good foliage in less time than any silk country known, where the best silk of the Bambex Mori is produced.

Third, our climate embraces all latitudes and altitudes, so that if one technical difficulty arise in a certain locality another can be tried. Soil and and climate have been demonstrated beyond all dispute to be favorable to the production of silk in this country, especially in California, where there can be no fault for the silk industry but with the people.

Yes it is a fact that the trouble is with the people, who are not educated on this line of industry. In Italy there are 400 schools and colleges where they educate the youth of the land in all the intricacies of the silk business, from the raising of the tiny silk worms to the weaving of the finest fabrics.

Would not such schools be of profit in this country? Would it not be well to interest the public in this infant industry? It seems to me we shall profit thereby.—Mrs. Carrie Williams, San Diego.

MIDLAND FOODS.

Our second page this week shows that the old favorite, the Midland Poultry Food is still in the field and is talking of its merits. Its friends say its strongest talk is in the poultry yard, where it shows its worth in the health of the stock and the products of the nest. The Petaluma Incubator people are coast general agents, but it is handled in almost every town.

* * *

Frost prevention has not yet become an exact science, but the possibilities of saving an exceedingly valuable crop when only a few degrees are required is proved by practical experiments for years. One of the first systems was the coal basket plan, which has been more lately superseeded by the oil pot, or the briquette, made of crude oil and some substance compacted into a mass which slowly burns with heat and smudge sufficient to make several degrees differe nce. Another feature of safety is an automatic frost alarm. These will be more particularly touched upon next week and a special article on frost protection will occupy the first page of our paper.

* * *

Emerson disc plows are advertised this week. Better, they are advertised every week by those who have used them and find how admirably they work under nearly all conditions. But the extension of business into new fields calls for reaching new customers through the Cultivator columns. The old, reliable Newell Mathews Co. are handling them.

AN OPPORTUNITY.

Any one in search of an opportunity to secure a modest living with a small investment in a business and a cosy home combined may read with profit an ad on another page of this week's issue regarding the offer to sell the White Plume Poultry ranch at Prospect Park. This is the property of Mrs. Basley, who has charge of the Poultry Department of this paper, and is stocked with prize winning White Rocks and Indian Runner ducks.

The writer of this had the pleasure of a visit to this little place a few weeks since, and found much of interest in the fine stock and in the convenient arrangement of yards and houses. The place is small—an acre and a half. It has a cozy cottage home, barn, poultry buildings, two wells and wind mills and better than all, it has a reputation for fine stock which is a business bringer. Mrs. Basley has believed in keeping prize winners, has kept them and has won the prizes.

The property is an income bringer at the present time, is in a part of the city in which it is pleasant to live, only a few minutes from the business center of Los Angeles.

Sickness in the family compels Mrs. Basley's attention elsewhere is her reason for disposing of this property.

The olive crop in Southern California which is now being harvested, gives evidence of a better yield than last year. In the territory about Los Angeles it is estimated 5000 tons of olives will be harvested.

The oranges are beginning to turn yellow at Oroville and growers there are of the opinion that the entire crop will be marketed by Thanksgiving.

Weather conditions during the week were very favorable for raisin making and fruit drying, says McAdie, section director. The first crop of raisins has been secured in excellent condition and heavy shipments are now being made to eastern markets from the Fresno and San Diego districts; it is reported that the yield is greatly in excess of last season's. The second crop of raisins is said to be light in some sections; curing is progressing rapidly. Late grapes are still abundant, and large quantities are going to wineries and shippers. The prune crop is nearly all dried and under shelter; the yield is below average, but the fruit is of superior quality. Other deciduous fruits are all secured except late apples, which are yielding an excellent crop. Walnut picking is progressing, and the crop is below average, though the quality is said to be good. Oranges continue in excellent condition and are coloring rapidly; the outlook is good for an unusually heavy yield in all sections and the fruit is reported of very fine quality. Tomatoes are yielding a good crop. The honey yield in Southern California is excellent.

The lima bean crop is now reported very good, though somewhat less than early estimates. Sugar beet season has closed. The new crop of celery is in market. Farmers in some sections are preparing to seed a large acreage of grain, and plowing and seeding are in progress. Pasturage is scarce.

SAN JOAQUIN VALLEY.

Heavy shipments of the first crop of raisins are being made from the Fresno district, where the yield is reported much greater than last season's. Prune drying is practically completed; the fruit is of unusually good quality, but the yield is generally below average. Oranges continue in good condition and are coloring rapidly. The last crop of alfalfa has been secured, and thrashing continues. Pasturage is scarce, but cattle are healthy and in good condition. Plowing and seeding are progressing.

SOUTHERN CALIFORNIA.

Clear, warm weather prevailed during the week, with fog along the coast. Raisins are drying slowly and evenly, and large quantities are going to the packing houses; several carloads have been shipped east from San Diego. Fruit drying is nearly completed. Citrus fruits are in excellent condition and coloring rapidly; it is expected that the orange crop will be much above average in quantity and quality.

Since the law went into effect last July, authorizing the exclusion of impure foods, Dr. W. H. Wiley, chief of the National Bureau of Chemistry, inspected 205 cargoes of imported goods. He condemned twenty per cent. of these cargoes. Of the rejected goods five were Rhine wine and contained salicylic acid; two white wine contained sulphuric acid; four olive oil contained cotton seed oil and were mis-branded; three Frankfurter sausages contained preservatives injurious to health; four canned vegetables were covered with lead tops that come in contact with the food; one vinegar which was also misbranded; one cargo of coloring matter for foods containing coal tar dyes.

The Bureau of Immigration, in a statement just issued, reports that we receive from other countries in August 64,977 immigrants, as against 45,549 in August last year.

Los Angeles Markets.

LOS ANGELES, Cal., Oct. 29.

The vegetable market has shown a large decrease in quality this week owing to the closing season and frost in the northern country. Fruits share the same decrease.

Good potatoes are scarce for the very best grades, but the tone is a little easier on all other grades. Northern potatoes are coming in freely.

Onions are slow; local about cleaned up.

Butter situation unchanged.

Ranch eggs very firm, other kinds firm and scarce.

Lima beans weak; pinks fairly steady.

Poultry scarce.

Demand for game somewhat lessened.

Hay firm.

Butter.

San Francisco Markets.

Dairy.

San Francisco, October 29.

Fancy grades of the better lines of butter continued in good demand all the past week. Trade in the cheaper quality continued unsatisfactory in volume, with prices at about last week's quotations.

BUTTER—Per lb:

Creamery, extras	.29 @30
Creamery, good to fancy	.26 @28
Dairy extras	.24 @25
Dairy choice	.22 @23
Store	.18 @20
California Storage	.24 @27
Eastern Creamery	.23 @25

CHEESE—Per lb:

Cal. Creamery, mild new, extra	.14 @15
Cal. Creamery, mild new, choice	.13½@14
Young America	.14 15½
Eastern, New York Cream, Cheddars and flats, new	.14½@16

Eggs and Poultry.

The buoyancy and vigor to the demand for Eggs has entirely disappeared and under the cautious operation of buyers and the willingness of holders to sell, the general market is in an unsettled state. Prices were shaded rather sharply from the previous week, and while in a small way for an extra lot of selected Ranch as high as 55c may have been exacted, there were comparatively liberal supplies of first quality stock to the had within the quoted range of prices, which were generally deemed conservative. Cold storage Eggs were steady at former prices and a good trade was in progress.

EGGS—Per doz:

Ranch, selected large	.52 @53
Ranch, good to choice	.45 @50
Store	Nominal
California storage	.30 @33
Eastern	.25 @30

Trading continued comparatively slow in the Poultry market during the week, but as there were no arrivals of Eastern stock and as receipts of local Fowls were moderate general conditions varied but slightly.

POULTRY—Old Roosters, per doz., $4.50@5; young Roosters, $4@5; Fryers, $3.50@4; Broilers, large, $3@3.50; small, $2.50@3; Hens, small, $4.50@5; large, $5.50@6; Ducks, per doz., old, $4.50@5; young, $5@6; Turkeys, young, per lb., 20@22c; old, 14@17c; Geese, per pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz., old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

Potatoes have been coming into market quite freely this week, which has had atendency to depress prices, but the demand has been good and the quality of potatoes is very fine.

VEGETABLES—Tomatoes, per box, 25@50c; Green Peppers, per box, Bell, 50@60c; Chile, 25@40c; String Beans, per lb., 1½@3c; Wax, 2@3c; Lima, per lb., 3@4c; Green Peas, per lb., 2½@3½c; Egg Plant, per box, 40@60c, Summer Squash, per box, 35@50c; Cucumbers, per box, 40@50c; Garlic, per lb., 3@4c; Okra, per box, 40@65c; Marrowfat Squash, per ton, $10@$12.50; Hubbard, $12.50@15.

ONIONS—Yellow, per ctl., 50@85c.

POTATOES—Per ctl.: River Burbanks, 40c @75c; Early Rose., nominal; River Reds, 50@65c; Salinas Burbanks, $1@1.40; Oregon Burbanks, 75c@$1.10; Sweet Potatoes, $1.25.

Fruits and vegetables show considerable advance in prices over last week, the change being most marked on garden stuff.

APPLES—Per box, common to choice, 25@85c; fancy, $1@1.25.

PEACHES—Per box, nominal.

PEARS—Per box: Winter Nellis, $1@1.25; other varieties, per box, 35@75c.

PLUMS—Late Red, per box, 50@65c.

FIGS—Per box, $1@1.25.

NUTMEG MELONS—Per box, 40@85c.

TABLE GRAPES—Per small box, 25@50c; crate, 40@65c; Isabella, 50@60c; large box, 75c @$1.25, as to variety; Wine Grapes, per ton, Zinfandel, $17@21; Mission, $14@17.

POMEGRANATES—Per small box, 50@75c; large box, $150@2.25.

PERSIMMONS—Per box, 50c@$1.

QUINCES—Per box, 40@60c.

BERRIES—Per chest: Strawberries, Longworth, $7@10; Malindas, $1.50@$3.50; other large varieties, $5@6; as to quality; Raspberries, $5@6; Huckleberries, per lb, —; Cranberries, per bbl., Cape Cod, nominal; Oregon, per box, $2@3.

TROPICAL FRUITS—Bananas, per bunch, Hawaiian, $1@1.75; Bluefields, $2@3; Pine apples, per doz., $1.50@2.50; Dates, Fard, per lb., 7@9c; do Persian, 6@6½c.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal; Valencias, $2@2.75; Lemons, $1@3; extra, $3.50; Grape Fruit, $1.50 @2.50; Limes, $4@4.50.

Dried Fruits, Nuts, Etc.

The buoyancy to the demand for Dried Fruits has been entirely dispelled and rather a quiet tone has settled over the trade generally. Prices, however, show no quotable

variance, as stocks are not regarded as excessive and there is a certain confidence displayed by some large dealers in the future condition of the market. No new business of any importance has been reported during the week and the only interesting feature noted was an inquiry for small Prunes from European sources. As stocks of these are light, asking prices have been too high to warrant any large sales. The season for Nuts is opening under favorable conditions and firm prices are prevailing for present supplies. Honey is moving slowly and the market is easy under liberal supplies.

DRIE DFRUITS—Prices for carload lots, f. o. b. at California common shipping points, in bags, for 1903 crop, are, per lb., as follows:

Apples—Evaporated, 5@6c; Sun Dried, 3½@4c.

Apricots—Royal, fancy, 9½@10c; choice, 8@8½c; Moorparks, choice, 10@12c.

Peaches—Choice, 5¼@6½c; fancy, 8½@9c. peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Black, 4@4½c.

NUTS—Per lb: California Almonds, hard shells, 8@8½c; soft shells, 8@8½c; soft shells, 10@11c; paper shells, 11@12c; standard, 9@9¾c; Pecans, 11@13c;Pinenuts, nominal; Peanuts, Eastern, 6@6½c; do, California, nominal; Brazil, 10@11c; Filbert, 10@11c; California Walnuts, soft shells, No. 1, 13½c; do, No. 2, 11c; hard shell No. 1, 13c; do, No. 2, 11c; Hickory, nominal;; Chestnut, California, 10@15c; Cocoanuts, $4.50@5 per hundred.

Beans.

There was a fair volume of business in progress in the local market for Beans during the week and the prevailing prices were maintained with a marked degree of steadiness. Brokers reported a lively trade in shipping channels at full quotations and several straight and assorted car lot transactions were closed. Seeds continued nominal in price.

BEANS—Prices per ctl.: Large Whites, $2.50@2.85; small do, $3@3.25; Pea, $3@3.25; Lima, $2.85@3; Red, $2.90@3; Pink, $2.40@2.70; Bayo, $2.25@2.40; Blackeyes, $2.25@2.60; Red Kidneys, $4.25.

Live Stock.

In sympathy with the weakened markets in eastern centers and under liberal supplies the local market for Hogs has assumed an easier tone and prices are a fraction lower. Otherwise the market for Live Stock is without particular change, prices ruling steady and the demand continuing of satisfactory volume.

CATTLE—No 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6½@7c; No. 1 Cows and Heifers, 6½c, second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½c @4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb.: Hard grain fed, weighing alive 130 lbs and over, 5½@5⅝c; weighing under 130 lbs, 5¼@5⅜c; weighing 260 to 350 ibs., 5@5¼c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13 @$16.50; Wheat and Oat, $13@15.50; Oat, $11.50@14.50; Barley, $10@13; Clover, $9.50@$11.50; Alfalfa, $9.50@12; Stock, $8.50@10.50.

STRAW—Good to choice, per bale, 55@65c.

FEED CORN MEAL—Choice grades, per ton, $30@31.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@29.

BRAN—Per ton, $22@23.

CRACKED CORN—Choice quality, per ton, $30.50@31.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $16.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

Hops.

The price for new crop is 20@22½c, according to quality.

Wool.

Fall clip, per lb.: California, Plains, 8@10c; Foothills, 10@12c; Middle Country, 11@13c; San Joaquin Lambs', 9@11c; Northern Free 11@12c; do, Defective, 10@11c; Humboldt and Mendocino, 1214c; Nevada, 13@15c; Oregon, 17@19c.

Eastern Markets.

Grain and Produce.

CHICAGO, October, 28.—Under the influence of the large export busines of yesterday and more reassuring news from St. Louis in regard to the bank situation there, wheat opened firm, with a good general demand. December being up ⅛ to ¼ at 80¾@80⅞. Traders watched carefully the action of the St. Louis market, and when prices there began to decline, soon after the opening, apprehensions of further trouble seized the pit and a selling movement was begun, which became general when the December option at St. Louis showed a loss of over a cent within the first hour. Prospects of increased receipts in the Northwest also helped in bringing out selling orders, and the market soon became weak, December declining to 80⅛. Late strength in corn, with a recovery at St. Louis caused fair buying by pit traders and the early loss was was all regained, December closing ¼ higher, at 80⅞. The early strength in wheat caused a firm tone in corn at the opening, but later, with the decline in wheat, there was much corn for sale, and prices eased off. December closed at 44½, a gain of ⅝ to ¾. Oats were influenced mainly by the action of wheat and corn, showing some decline early in the session, and later rallying and closing at a small gain. December closed ⅜ higher, at 38½. Trade in provisions was extremely dull, but inclined to firmness, considering the decided weakness in hogs reported from the yards. Buying by packers was the chief source of support. Closing prices were firm, with January pork up 10c; January lard a shade higher, and ribs 5c higher.

Grain Movements.

Articles	Receipts.	Shipments.
Flour, barrels,	43,900	22,700
Wheat, bushels	267,300	246,900

Chicago Live Stock.

CHICAGO, October 28.—Cattle—Receipts, 25,000; Texans, 7000; western weak; good to prime steers, 5.30@5.75; poor to medium, 3.60 @4.85; stockers and feeders, 2.25@4.10; cows, 1.35@4.25; heifers, 2.00@4.75; canners, 1.35@2.50;bulls, 2.00@4.60; calves, 2.00@6.75; Texas-fed steers, 2.75@3.50; western steers, 3.00@4.75. Hogs—Receipts today, 26,000; tomorrow, 20,000; 10@15c lower; mixed and butchers', 5.25@5.60; good to choice heavy, 5.25@5.50; rough heavy, 4.90@5.20; light, 5.10@5.50; bulk of sales, 5.20@5.45. Sheep—Receipts, 30,000; sheep and lambs steady; good to choice wethers, 3.00@3.75; fair to choice mixed, 2.00@3.00; western sheep, 2.25@3.85; native lambs, 3.25@3.75; western lambs, 3.50@5.00.

California Dried Fruits.

NEW YORK, October 28.—While demand is not particularly active, the market for evaporated apples continues firm, with common quoted at 4@4½; prime at 5⅞@7; choice, 6¼@6¾, and fancy, 7. Spot prunes show little improvement, and demand is unchanged, with quotations ranging from 3¼@7 for all grades. There is a fair demand for apricots, with choice puoted at 4¼@5½; extra choice at 10@10½, and fancy 11@12½. Peaches are rather quiet, but are steadily held at 7¼@7¾ for choice, and 7¾@8¼ for extra choice, and 9¼@10¼ for fancy.

CITRUS MARKETS

CITRUS FRUIT SHIPMENTS. Carload shipmnets of citrus fruit from Southern California to eastern points reported are as follows, the season beginning November 1, 1902:

Up to Wednesday, 22,384.

Of the season's total 2757 carloads are lemons.

The orange market showed considerable fluctuation during the week. In the early days the prices varied according to the supply furnished.

On Monday four car loads of oranges sold, bringing the highest prices of the season, $6.35 to $8.00 per box, or an average of $7.41 per box.

Tuesday but one car load was sold, which brought $6.85. No lemons or grape fruit were sold. As will be noticed in the quotations below lemons are bringing specially high prices, and the prospect is that they will continue to command good prices for some time to come.

At auction points a good winter market is expected. There will be a demand for all the fruit of first quality that will be offered.

AUCTIONS.

RAISIN FIGURES. From Fresno comes the informaion that the quantity of raisins received by the association up to October 17 was footed up this week and shows in round numbers 54,000,000 pounds. On the same date last year the receipts were 42,000,000, which makes an excellent comparative showing. It is estimated that about five-eighths of the crop is in, which will make the total crop over 86,000,000 pounds. Last year the crop was 80,000,000 pounds, or an excess this year of at least 6,000,000 pounds. This means a large addition to the wealth of the raisin-growing counties, though the gain has come from increased acreage. The average yield per acre will fall considerably short of last year.

Dr. W. H. Miller, Health officer of Kings county has notified all persons engaged in or carrying on butcher business, or sale of meat supplies for public use, in Kings county, not to sell or offer for sale, meats or animals fed upon diseased carcases or offal from slaughter houses, except it first be thoroughly and perfectly boiled.

SUMMONS.
No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 14 day of Sept., A. D. 1903.

C. G. KEYES, Clerk.
(Seal) By C. O. Winters, Deputy Clerk.

SUMMONS.
No. 42415. Dept. No. 5.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the clerk of said Superior Court.

The People of the State of California send greeting to:

Mollie Estill, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for any other relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 19th day of Sept., A. D. 1903.

(Seal) C. G. KEYES, Clerk.
By C. O. Winters. Deputy Clerk.

Office, 128 Hellman Blk. Works, Atlantic St. and Santa Fe Tracks

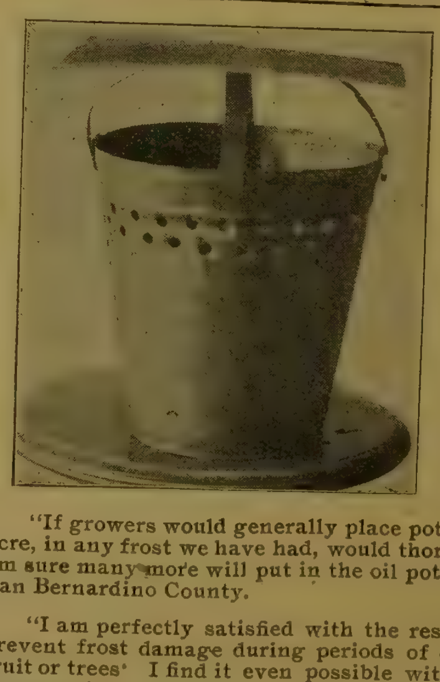
Los Angeles, California

Orchard Briquettes are in size 12 inches by 6 inches and 5 inches in thickness, weighing about 9 pounds each. They are to be burned in the orchard on the ground, requiring nothing to contain them, and being entirely consumed unless intentionally extinguished. Two or three are inclined towards each other, forming a pyramid, leaving free vent beneath for air passage, at which point the torch should be applied. No kindling is required. It will burn long enough to meet the requirements of the usual cold night. In orchards where some degree of protection is afforded by wind breaks or trees being large and close together, two Briquettes are used to the fire, twenty-five fires to the acre, one ton being sufficient to protect four acres for one night. In open and more exposed groves we suggest using three Briquettes to the fire or one ton to three acres for one night's fires. It is best to use the extra Briquette on the first two rows of fire on the exposed side of the grove.

Briquettes are impervious to water; and when placed in position where they are to be burned if it should rain, the Briquettes shed the rain and are in condition to light at any time, and burn as freely as if not rained on. They should not be exposed to hot sun.

Price $12 a ton f. o. b. Los Angeles. Present freight rate same as coal. We hope to have a lower rate based on rate for fertilizers made, and are working for same.

Griffiths, Munson Briquette Co.



SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

**NO SMUT
SIMPLE AND
EFFECTIVE**

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees. I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is heal'hy, wtih fine flavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

Some Good Things for Poultry

Armour's Beef Meal, made from Cooked Beef Hearts and Livers.

Seems Almost Too Good for Poultry

Only one place in the world where they accumulate so many hearts and livers that they use them for making beef meal for poultry.

At this place, the largest packing house in the world, they slaughter thousands of cattle, sheep and hogs and this is how they accumulate so many hearts and livers.

These hearts and livers are baked to a crisp; then they are ground into a fine meal.

The quantity is limited and a carload a month is all that can be had of this and we will use the most of it in preparing Coulson's Egg Food and Coulson's Chick Food.

We have a carload, 20 tons, 400 sacks, which will arrive in a few days and we can spare about 75 sacks of this meal. We will sell it in small amounts at 4 cents a pound. 100 lb bags for $3.50.

You can imagine how the little chicks will go for it! And for the old hens mix it in with the other feed and how they will cackle and lay!

Armour & Co. guarantee this meal to average more than 65 per cent protein. One pound equals four pounds of raw meat. That makes it as cheap as horse meat at less than one cent a pound. Being thoroughly dried, it will keep without spoiling and has no disagreeable odor.

And Armour & Co. guarantee that it contains nothing whatever injurious to poultry. A sample free for the asking. We hunt the world over for good things for poultry. Send for free sample.

Armour's Pure Blood Meal

Everybody Knows That Blood Contains All the Elements Necessary for Flesh and Egg Production It is a Valuable Aid to the Growth of Anything of the Animal Nature.

Hence it is not strange that blood that is immediately cooked or dried and submitted to a process that makes it odorless, should be valuable to use in poultry food. There is a vast difference in blood meal. Most of the blood meal on the market is not fit for anything except for fertilizer.

We get blood meal from Armour Packing Company in the East in order to get the very best. A carload is on the way now. This is one of the articles we use in preparing Coulson's Poultry Food. If you wish some of this good blood meal, we will be pleased to supply you. Price, small quantities, 5c a pound; 100 lb bag, $4.25. This blood meal contains over 80 per cent protein, one pound being equal to about five pounds of raw meat.

Beef Scraps===Choice beef scraps, fine ground, ready for use

The ordinary cracklings, or scraps, sold on the Pacific Coast are mostly pork scraps and contain too much fat to be fed very exclusively to laying fowls. There is another kind of so-called beef scraps that are the refuse of the renderings of soap works, and which are sold as high protein beef scraps. In order to get good beef scraps that are fresh and of good material we have made arrangements with a firm situated at the largest slaughter house in Chicago and the largest stock yards in the world, to furnish us with choice fine ground beef scraps in car load lots. A car load is on the way now and is expected to arrive now any day. One pound of this beef scrap is worth more than 2 pounds of raw meat, hence it is much cheaper than horse meat. We will sell these ground beef scraps at $3.25 per 100 pound bag and a little cheaper in ton lots. Send for free sample.

COULSON'S EGG FOOD

COULSON'S EGG FOOD is the best of all, as it contains everything complete to enable the hens to lay eggs in abundance.

When you feed Coulson's Egg Food you do not have to buy any of the other things, because everything is already mixed in this food. Beef meal, blood meal, fresh ground bone meal, charred bone charcoal, flax seed meal, willow charcoal, ground sifted oats, middlings, pea meal and other meals, and all things needed to make the richest and best egg producing food. We buy all these things in wholesale quantities at the very lowest cash prices. It is then thoroughly mixed by machinery in the right proportions by those who who know how and you have only one profit to pay. The poultryman that buys an article separately has to pay a profit on every single article he buys and conseqeuntly it costs him more money to mix a ration with only one or two articles, than it would to buy Coulson's Egg Food with everything complete.

Besides, the man who buys in small quantities has to take what he can find at the local stores and pay a big price for inferior articles, while we go thousands of miles in order to get the right kind of material. We do not use fertilizer stocks. Any poultryman is at liberty at any time to inspect the material we use in manufacturing Coulson's Poultry Foods. We are always pleased to show any parties through our factory as we are proud of the fact that we have the very best food articles obtainable.

Coulson's Egg Feed

Why You Should Feed It

It is a wholesome and safe food, contains nothing injurious. A correctly balanced ration, a scientific feed prepared by practical people who know how.

IT IS NOT AN EXPERIMENT. It is successfully used by hundreds of the most successful poultrymen and recommended highly. Fed as a warm mash either morning, noon or evening. SAVES BOTHER IN MIXING; YOUR TIME IS WORTH MONEY. Produces excellent results by natural methods. Price reasonable—CHEAPEST FOOD ON THE MARKET as it gives the best results.

GOES TWICE AS FAR as ordinary feed. INCREASES EGG PRODUCTION, furnishes bone, muscle, feathers and meat and helps fowls to grow. Pullets begin laying earlier. Shortens molting period. You can have eggs in winter when eggs are profitable. It is just the feed that all poultrymen are looking for—a feed that makes hens lay eggs nearly every day. ONE HUNDRED AND SEVENTY-FIVE EGGS PER YEAR PER HEN by feeding the hens Coulson's Balancel Ration Egg Food. Are you feeding your hens Coulson's Egg Food? If you are not, then you are making a great mistake. Coulson's prepared food for laying hens is just what your hens need and they must have it, if you expect them to lay many eggs at this time of the year. There is in Coulson's egg food everything complete to help the hen grow the eggs.

Mr. D. H. Ward at Cotati says: "I have fed Coulson Egg Food for over a year and I am well satisfiedwith it. I am now getting 90 dozen eggs a week from 500 hens. My hens laid well all last winter on Coulson's Egg Food and will continue to feed it this winter.

Others try to economize by buying cheaper feed, but they make a great mistake.

Price of Coulson's Egg Food at factory. We do not pay freight. One sack, $1.65; 5 sack lots, $7.75; ½ ton, 11 sacks, $16.50; 1 ton, 22 sacks, $33.00. We place on cars free of charge. Sample and catalogue of Poultry Supplies free.

NOVEMBER 6, 1903

Hop Picking Scenes in Sonoma County.

The growth of the hop production of California is best told by a comparison of the figures. In 1888 there were 34,605 bales or 6,400,925 pounds harvested. In 1902 there were 53,500 bales or 10,165,000 pounds harvested. The total production of the world averages from a million to a million and one-quarter bales. California averages eleven million pounds.

Frost Checkmated==Fruits Protected

Griffiths, Munson Briquette Co.

Phones—Main 806, Home 806. Office, 128 Hellman Block. Works, Atlantic St. and Santa Fe Tracks. LOS ANGELES, CALIFORNIA.

Orchard Briquettes are in size 12 inches by 6 inches and 5 inches in thickness, weighing about 9 pounds each. They are to be burned in the orchard on the ground, requiring nothing to contain them, and being entirely consumed unless intentionally extinguished. Two or three are inclined towards each other, forming a pyramid, leaving free vent beneath for air passage, at which point the torch should be applied. No kindling is required. It will burn long enough to meet the requirements of the usual cold night. In orchards where some degree of protection is afforded by wind breaks or trees being large and close together, two Briquettes are used to the fire, twenty-five fires to the acre, one ton being sufficiect to protect four acres for one night. In open and more exposed groves we suggest using three Briquettes to the fire or one ton to three acres for one night's fires. It is best to use the extra Briquette on the first two rows of fire on the exposed side of the grove.

Briquettes are impervious to water; and when placed in position where they are to be burned, if it should rain, the Briquettes shed the rain, and are in condition to light at any time, and burn as freely as if not rained on. They should not be exposed to hot sun.

Price $12 a ton f. o. b. Los Angeles. Present freight rate same as coal. We hope to have a lower rate based on rate for fertilizers made, and are working for same.

One man can light and take care of ten acres of fires; taking into consideration that those using coal have to employ several men to look after like number of acres, the cheapness of firing is greatly in our favor.

Our Briquettes will not smut or blacken fruit or trees, which can not be said of Crude Oil or Distillate. Smoke from either will smut and blacken fruit and trees, and has been known to injure the flavor of lemons where Oil and Distillate have been used. Our Briquettes are mixed and cooked in open kettles twenty to thirty feet long, so all loose soot is driven off.

We believe that if our fuel is fairly used for one season it will prove so satisfactory that we are assured of continuous patronage. We can furnish testimonials as to its merits from the largest citrus fruit growers in Southern California who have used a similar fuel the past season and have largely increased their order for this season.

We trust we may receive your order for such quantity of our Briquettes as you may require for this season. If season should be so mild as not to require fires, our Briquettes will carry over several seasons without deteriorating. They can be thrown at root of tree out of the way of plow, and remain until needed.

In case the temperature moderates after a fire has been started, throwing a little dirt upon the Briquettes will put the fire out and save the Briquette for future combustion. Soliciting your orders for this fuel, we are

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 19 LOS ANGELES, CAL., FRIDAY, NOVEMBER 6, 1903 Subscription $1 a Year

...Protection From Frost...

A Valuable Paper Read by Dr. E. W. Reid of Ioamosa at the Seaside Institute Last Summer.

A paper of this character will be valuable chiefly as it presents facts derived from the experience of those who have been engaged in fighting frost. With the purpose in view of gaining such information I solicited answers from representative growers in different localities of Southern California, to questions bearing on this subject. My thanks are tendered those gentlemen for the courtesy with which they have responded. I undertake briefly to summarize the answers to a few of the questions. While there was some diversity of opinion expressed in answer to the question: "How low may the temperature go without material injury to ripened oranges, to matured lemons, and to young lemons?" the figures ranging from 24 deg. to 30 deg., there was a substantial concurrence in the opinion that 26 deg. was the limit for oranges, and two or three degrees higher for lemons, more of course depending on the length of time the low temperature lasts than on the degree reached. At the same time, some made statements which would indicate that a temperature considerably lower may be successfully withstood. One gentleman, who is not only a grower but also manager of a packing house, and, consequently, had good opportunity for observation, writes: "Oranges all over my district went through six or seven hours with the mercury at 22 deg., and, while the quality was not improved, the fruit all went to market and was received without complaint by the buyers. Only an occasional exposed specimen showed broken cells, none cut dry. Brown lemons passed through the same ordeal and in some orchards the loss was total. On my place, where we kept fires going all the latter half the night the loss would not exceed 5 to 10 per cent."

We doubtless shall remember the published statement of Mr. Teague, in the season of 1902, where the mercury went as low as 20 deg., and remained for several hours at 26 deg. While it is not safe to draw too hasty a conclusion from the facts and allow the temperature to go low without an effort to counteract it, there is to me a grain of comfort in the thought that our fruit may withstand a lower temperature than has ordinarily been believed.

Coal baskets and oil pots were the principal weapons employed, and the coal baskets were used by the larger numbers. The number per acre varied from 45 oil pots to 100 coal baskets, and the result varied from simply holding the temperature at the point reached when the fires were lighted, to affecting a rise of 6 deg. Wet straw and manure were also used in some instances for creating a smudge, about sunrise. One gentleman used a bricquette, made of asphaltum, oil and sawdust. Those districts in which the oil pots were used exclusively report the deposit of a certain amount of smut. The neighbors in some instances raise objections to this, and I notice from the reports that the trade objects. One of the Exchange agents says: "Such fruit has anything but an attractive appearance, and the worst feature about it is that the soot will not wash off. It is of an oily nature and appears to have penetrated the skin." Mr. Hofman, who is an ardent advocate of oil pots, while admitting that there is a danger from smut if the pots are used frequently, insists, to use his own language, that "The damage done by smut is a mere nothing (even were 75 per cent of the fruit blackened) as compared to damage done by cold, for in the latter case you lose your fruit, blossom, wood and hopes." And Mr. Bailey of Rialto, also a friend of the oil pot, suggested that the effect of the smut upon the rind of the fruit may be preservative, by destroying or preventing the formation of any possible fungus, and in support of his position adduces the fact that from his own orchard, in which fire pots had been burned, he took one dozen Mediterranean Sweets which showed in a slight degree the presence of smut, and from the orchard of a neighbor who had not fired he took one dozen Mediterranean Sweets, and kept all the fruit under the same conditions; at the end of two weeks the fruit from the ranch which had not been fired was soft, spongy and rotting; while the fruit from his own orchard was firm, and showed no signs of decay. I think it probable that the better condition of fruit from

(Continued on Page 352.)

California Citrus Interests

By President A. H. Naftzger

Mr. A. H. Naftzger, president of the Southern California Fruit Agency, who has just returned from an extended trip in the East in the interest of the large concern over which he presides, has been prevailed upon to give the Cultivator his views on two or three points of special interest to citrus growers of this State. The topics he discusses briefly, but cogently, as will be seen from the reading of the article are the prospects of profitable marketing of California oranges and lemons; competition, in which Florida is a vital factor, to be considered, and the effect Cuban reciprocity will have upon the citrus fruit industry of this country. The Cultivator readers will be pleased to read the suggestions offered by Mr. Naftzger, for they concisely present the citrus fruit industry of California as it appears at the present time.

Azro Huffman Naftzger.

"You ask me of the prospects for profitable marketing of California oranges and lemons. It cannot be expected that the rapidly increasing product of our orchards can be marketed to show the same profit to the growers that they realized when the crop was limited, and the competition less, but I see nothing in the situation to discourage our orchardists. Our navels and Valencias especially have created a demand for themselves. The fine appearance, delicious flavor, and good carrying qualities make the navel, which is our leading variety, very much sought after. No other orange in the world compares with it in the qualities named. It is true that during the past season, results have not been entirely satisfactory to the producers, but this was due chiefly to the character of the fruit itself. No one can deny that our fruit was lacking to very considerable degree in the fineness of texture and flavor which it usually possesses. Moreover good carrying qualities were wanting. In other words we suffered frightfully from decay in transit. It is true that the increasing quantity of other classes of fruits produced in nearly every section of the country is more or less in the way of successful marketing of oranges, but the demand for fruit increases accordingly. A few years ago, fine fruits were a luxury. Now they are a necessity in every household, and happily for everybody concerned, the majority of the people of the United States are able to enjoy this luxury. Of these various fruits, apples more than any other, displace oranges. This year, the apple crop is excellent in quality, and fairly large in quantity. This, as everybody knows, is the fruit of the common people.

* * *

Competition.—Our chief competition in citrus fruits is from Florida, which has been very little in our way since the great freeze of 1894, but many of the old orchards are partially recovered and a vast acreage of new ones have been produced in the more southerly portions of the peninsula. It is variously estimated that Florida will ship this season from 1,250,000 to 2,000,000 of boxes of good fruit. This is a wide range in the estimate, but it is imposible to estimate a Florida crop with anything like the accuracy of a Cali-

OF GENERAL INTEREST.

Emma Booth Tucker.—The country has lost a noble woman, and suffering humanity a devoted friend, in the death of this great Salvation Army leader. No woman of the age was more universally known, nor more profoundly loved than Mrs. Booth-Tucker. She had a peculiar faculty of grasping conditions, and a directness and versatility in planning remedial agencies for distressing affairs, in the lives of those whose interests she served, which was possessed by few men or women of this day. From one end of the civilized world to the other, where this christian woman was known and loved, the poor, the down hearted, the needy will be filled with sorrow as they contemplate the startling truth that their loved and trusted colaborer and friend is on earth no more. It is doubtful if any man or woman's death in the last year has created such universal sorrow as that of Emma Booth-Tucker. Why?

Because she could fathom the sorrows of the human heart and pour over the wounded soul the healing oil of sympatny and love. Like Martin Luther, she was a reformer who began her work of saving souls by loving the soul she sought to save. Love was her all-powerful sword, with which she cut away the outposts of error and through which she held the christianized world captive at her feet the past ten years.

Yes, Emma Booth-Tucker is dead—and with people who believe in prayer there is one great sob.

* * *

Gigantic Alliances.—The initial proceedings of what will develop into a gigantic combination of opposers of "unions" have taken place in Chicago, in which the Citizens' Aliance and Employers' Associations have united, with non-union laborers to oppose the unjust demands of unionism. The key-note of the organization was sounded in the following declaration of principles:

"To aid all the people of America in resisting encroachments on their constitutional rights and assist local, state and national manufacturers and employers in their efforts to establish and maintain industrial peace, and to create and direct a public sentiment in opposition to all forms of violence, coercion and intimidation."

The purpose of this vast alliance is to combine anti-unionists of every department of labor in one solid organization all over the United States.

Public sentiment has become so embittered at the demands of walking delegates and their followers. It will not longer brook the tyranny of this class of citizens, nor silently submit to its dictation. The result will be a struggle of historic proportions, but we trust at its conclusion both capitalists, non-union and union adherents will reach an understanding, in which all interested parties shall be satisfied. The right to labor, urestricted, to be guaranteed to every citizen, and the dignity of labor fully acknowledged and respected by all men everywhere.

* * *

Thanksgiving.—The President of the United States has issued the annual proclamation, to the people, inviting observance of the time honored day, as best comports with conditions which surround the public and the private individual.

Thursday, November 26, is the day set apart for national Thanksgiving, and a respectful observance of such religious rites as well befit a Christian nation. The language in which the proclamation is worded implies an earnest desire, on the part of our chief magistrate, that the country shall fully appreciate the great blessings which surround it. The bountiful harvests; our escape from pestilence; the marvelous developments in our industrial avenues and commercial fields; continued peace at home and abroad are all conditions which call for thanksgiving and praise by the recipients of these favors.

With hearts 'oreflowing with gratitude to the divine source of all our good, let us, as a nation, and let California, as a State, "give thanks and be exceeding glad" for many have been our mercies and great the achievments secured during the year now passing into history.

* * *

Strikes Elsewhere.—Labor troubles do not seem to be confined to the United States. They are quite as frequent, and collossal in magnitude, in other nations as in ours. Indeed, they do not appear to be confined to race or country, but break out wherever conditions call for readjustment of wages, or where labor is led to think it has a just cause for protest.

This week the scene of turmoil has been shifted to Spain, where the most general aggressive strike on record is in progress as we go to press. The center of the storm is the city of Bilboa, where 40,000 strikers and their sympathizers are making things "hot" for the authorities who, aided by police, and detachments of the army, are waging an almost too severe warfare against the dissatisfied Spanish strikers. It should be borne in mind that the Spanish workingman has a far different cause of action from the American laborer. The former is starved, the latter is fed to satiety, lives in a comfortable home, enjoys the blessings of church and school and has nothing to complain of but the interruption of the walking agitator—who is really his most serious cause for apprehension.

* * *

Benefits of Co-operation.—The Fresno Republican of this week makes a vigorous appeal to the raisin growers of that district to continue the Raisin Growers' Association, which by contract, soon expires. The usefulness of the association, it is urged, has been more than apparent from the benefit it has been to its members, in the marketing of the fruit and in the prices received by the raisin growers. The position taken by the Republican is uncontrovertable on the general proposition of the advantages derived from co-operation. The Southern California Fruit Exchange is an example of what may be accomplished by intelligent co-operation of people engaged in a particular industry. The raisin growers of the Fresno district will do well to hold steadfastly to the principle of co-operation, for honestly and efficiently conducted, there is no reason why a business run under that regime shall not succeed.

* * *

Independence of Panama.—Revolution has broken out in Panama, the result of the long-drawn out conflict of opinion regarding the disposition of the Isthmian Canal question and other local questions. The United States has ordered a squadron of war ships to the coast to protect American interests. In this connection it may be said there are indications of a general war in the Central American colonies north of Colombia.

Nicaragua and Honduras have for some weeks been on the verge of an outbreak, and the Washington authorities are expecting open hostilities to occur at any time.

* * *

Refrigerator Cars.—A project is under way by the leading railway magnates of the country to organize a car company with a capital stock of at least $5,000,000, which shall buy all the refrigerator cars and cars of special types, and operate them in the interest of the railroads.

A brief outline of the plan is given by Mr. Midgley in a circular distributed among leading railway officials. His solution involves the organization of a company which shall be owned or controlled by the railroads, and which shall operate special type cars at a per diem charge, which shall bring a fair return on the money invested. It is the purpose to offer all special type car companies what is considered a good price for their equipment, and if the offers are refused the railway equipment company will build its own cars.

In the meantime, Mr. Midgley recommends that the railroads cease paying for the use of private cars when hauling them empty, and reduce the compensation for their use, so that cars now receiving one cent a mile shall receive three-quarters of a cent, and those receiving three-quarters shall receive 6 mills.

This is the opening wedge to the parting of the ways between the railroads and the refrigerator car companies owned by Armour & Co. It is high time the break should come, for between the regular freight rates charged by the railroads, and the charges for refrigerator cars, the latter having long been considered extortionate, the fruit grower and the stock shipper has indeed been "between the devil and the deep sea."

* * *

H. E. Cook, president of the New York Dairy Association, in one of his public addresses, suggests to farmers who attend institutes, to have a memorandum book and take notes of points made by the lecturer. He also insists that every farmer should be a constant reader of a good agricultural paper. In no other way can he keep abreast of the times.

* * *

Wall Street Gamblers.—The recent slump of stocks in the Wall street market has caused a great many people to inquire. What is the matter with the country? The Cultivator's answer is, there is nothing the matter with the country—at large. The crops have been good, returning immense revenues, no calamities of any magnitude have visited us; we are at peace with all the world and legitimate industry has enjoyed unprecedented prosperity. What then is the matter, and where is the trouble that so many are insisting exists? Whatever trouble there is in our industrial conditions, is chiefly due to the overcapitalization of stocks, of ship-building, steel and other trusts. It has come out that about four-fifths of the stock of the ship building trust is water, and the country has been flooded with over five billions of watered stocks; can it be wondered at if the confiding public, becoming informed of the true condition of affairs, refuse to invest in such property? How could such stock fail to slump from the forced and artificial price fixed for it by the get-rich-quick-promoters. Careful business men have come to know that they have no more chance of making a profit on their investments in trust stocks on Wall Street than of winning money at faro or roulette. The whole stock market schemes as conducted at present are gambling devices, and morally are no better than the schemes of the professional gambler with marked cards and loaded dice. The people in general would need to have no concern over the transactions of Wall Street were it not that these stock gamblers often by their reckless plungers disturb legitimate business. The masses of the people do not yet understand that the winning or losing of the stock speculators need not affect the general business of the country. Not understanding the true inwardness of the situation the masses become alarmed when a plunger goes to the wall. Hence a panicky condition is created depositors in banks from Maine to California withdraw their funds; a money stringency is created; the demand for goods is diminished; forced sales are made of goods at reduced prices, and workmen are discharged to reduce expenses. These are the evils resulting from the stock watering, gambling transactions on Wall Street. But there need be no such results, if the masses of the American people refuse to get excited when a Wall Street gambler gets caught in the trap he has set for the unsophisticated.

The particular form of human depravity that stands out most prominent today is the cruelty to domestic animals, and the animals most cruelly treated are the horse and dog.

..General Agriculture..

WHAT AILED THE DEACON'S PEACH TREES.

"Hank," said Deacon Pepperton one noon, as he seated himself on the Peters' porch, and fanned himself with his hat, "I'm gettin' discouraged 'bout that peach orchard o' mine."

"What ails it?" asked Hank Peters, lazily, from the hammock where he was taking his noon-time rest.

"Some o' the trees look sickly, an' some are dyin'. One or two are deader'n a door-nail already. It beats all what luck I have. Why, look at those peach trees o' yours—ev'ry tree as healthy an' chock full o' life as a heifer! I'd like to know what hinders my havin' trees as good as yours."

"Borers," grunted Hank, sleepily.

"Eh?"

"White grubs that bore into your trees."

"I haven't seen none," protested the Deacon.

"Have you hunted for 'em?"

"No-o."

"Why don't you?"

"Well—er—I haven't got time for one thing. Besides I don't think there are any borers in my trees—beggin' your pardon."

"Let's go an' look," said Hank, suddenly becoming wide-awake.

"But it's time we went to work," protested the Deacon, looking at his watch.

Hank, however, had rolled out of the hammock, found his hat, and was ready to start. "It'll take only a few minutes," said he, as he led the way to the Deacon's orchard.

Arriving there, Hank took out his jack-knife, opened the big blade and knelt beside the trunk of the nearest peach tree. First he scraped the soil away from around the trunk to a depth of three or four inches.

The Deacon with a dubious yet curious smile, watched the operation. "I don't see no borers," he remarked drily.

"Course you don't. They're inside, out o'sight—'twixt the bark an' wood. See that bunch o' gum an' those bits o' sawdust? Now you watch me a minute!"

With the knife he scraped off the gum, and proceeded to explore into the bark beneath with the knife-point. Stooping closer, the Deacon watched. A few careful stabs and cuts here and there soon revealed a narrow, downward channel under the bark. Following this down with the knife, Hank laid bare a fat white borer about an inch in length.

The Deacon whistled softly. Hank coolly killed the borer, then explored the upper part of the channel—finding and killing another borer hidden in a short cross-channel. The Deacon whistled again.

"Now," said Mr. Peters, innocently, let's look at your older trees. Maybe there ain't no borers in 'em."

This time the Deacon led the way. He was getting interested.

Again Hank knelt, and scraped away the dirt. Inside of five minutes he had found and killed fourteen borers in one tree-trunk. "Another year would have settled that tree," he remarked, casually, as he rose to his feet, and wiped the knife-blade on his overalls.

"Seems to me, though," ventured the Deacon, " that your knife cuts have hurt the tree 'bout as much as the borers could."

Mr. Peters hesitated. The remark provoked him. Then, remembering the Deacon's peculiarities, his face relaxed into a patient smile.

"See here," said he, good naturedly, "I didn't cut the bark 'cept where the borers had been, did I?"

"No-o," answered the Deacon, in a dubious tone.

"Then the bark-injury isn't much worse than it was before. And the tree is better off, because, as the borers are now dead, bark-injury has stopped. If I hadn't killed the grubs, they'd have gone on eatin' the inner bark till the tree was completely girdled, an' dead. Knife-cuts don't go on eatin', Deacon! They'll never be worse than they are now."

"Well, maybe you're right, Hank; but it looks like an awful job to grub-hunt a whole orchard o' trees."

"You'd prefer to have the trees die, would you?"

"Oh, not exactly that, but—"

"Well, Deacon, there ain't any easy or sure way of killing borers 'ceptin' to git down on your knees an' grub 'em out! The job ought to be done ev'ry year reg'lar. If you had attended to 'em ev'ry season you wouldn't have so many to dig out now, an' you trees would be a whole lot healthier."—Walter Andrews in Farm and Fireside.

This story carries its own moral.

SAN DIEGO BEE-KEEPERS.

The Julian Miner, in its issue of this week makes a strong appeal to the bee-keepers of San Diego county to organize for mutual protection and profit, and as the Miner says, to "keep up with the procession." The bee-keepers who organized last year derived great benefit from co-operation. "There was a much larger crop of honey in San Diego county last year than this and yet the price obtained then was 5.45 cents per pound, while this season 4.50 to 4.75 is the average price given by the commission merchant's association. Had the Julian bee-keepers association continued their organization and induced others to join they could undoubtedly have realized 6c for their honey. Commission merchants can't handle small quantities of honey as profitably as in car-load lots and hence will not pay the individual as much as can be demanded by an association. If any one can show a good reason for not organizing and can enumerate more benefits to be derived by each producer selling his honey separately, then it would be of interest to the public to have those facts published.

The Wholesalers' cut in the price of granulated sugar has caused general demoralization to the trade. There is no longer any attempt among wholesale grocers to maintain prices and grocers are particularly incensed at the sugar trust as the cause of the demoralization. As a result of the demoralized state of trade the American Sugar Refining Company, in Jersey City, and the National Sugar Refining Company, in Yonkers, have closed their plants temporarily.

State Mineralogist Lewis E. Aubury reports the value of the mineral products of California for 1902 at $35,069,105, an increase over the previous year of $713,124. Gold of course, continues to head the list, there being $16,910,320 worth of the precious metal mined during the year, Nevada county still leading in its production.—Vacaville Reporter.

It is predicted that Tulare county will, this year, produce 1200 carloads of citrus fruits as against 900 last year.

WALNUT PLANTING.

J. B. Neff, Esq.—Please pardon this intrusion, but I want some information on different varieties of walnuts that I am unable to get from the nurserymen and I have thought I could get this information from you, knowing that you are well informed in growing walnuts as well as fruits. We have frosts frequently in April in this locality, that kill the walnuts. I am told that there are some varieties of the soft shells that don't leaf out and bloom until in May, notably some of the French walnuts. Do you know of any soft shell walnuts which are good bearers, good commercial walnuts that are later in putting out in the spring than the Santa Barbara or Ford's improved? Which of these is the latest bloomer, and of usual seasons about what time do they bloom or leaf out? Would you advise the planting the grafted on the native black, or the English walnut root? At what age does the grafted walnut usually come into bearing? Is there much difference in the time of ripening of the late and early blooming kinds? These questions may seem flat to you, but an answer from you would be very much appreciated by the writer.—D. A. Kughen, Burbank.

I do not believe it would be safe to plant any variety of walnuts where there is much frost in April, particularly in case the thermometer goes below 30 degrees, as the walnut frost-kills very easily, and all that I am acquainted with begin to show leaves early in April, and usually in the latter part of March.

I have not seen any French walnuts that produce paying crops in the southern part of the state.

The latest blooming variety that I know is the "Placentia," but any variety can be retarded a few days by having the ground always well watered, so that they will hold their leaves well into the winter.

I have grafted trees on both the native black walnut and on soft shell roots. If the land is very sandy I prefer the native root, but a walnut should not be planted on very sandy land, except to fill out rows.

Grafted walnuts will begin to bear at once, but the nuts should all be pulled off until the fourth year after planting, so that the tree will grow faster.

Early and late blooming seedling trees in the same orchard will ripen at so nearly the same time that no difference can be noticed, but the very late bloom on any tree is almost sure to fall, as it does not seem to be properly fertilized; if not, the nuts will be very small.—J. B. N.

* * *

WATERING WALNUTS.

J. B. Neff.—It is said by some people that a walnut tree will die when the tap root gets into water. The water is from 16 to 20 feet below surface of ground here. In '98 it was 10 to 12 feet. Should the water rise again to 10 to 12 feet of surface will the walnuts die?—D. A. Kughen, Burbank.

If standing water does not come closer than 10 feet from the surface it will not do any damage, as the tap root of the walnut does not go as deep as is commonly supposed. The trees will not drown unless the water comes near the surface and stands for several weeks.

Have you whitewashed and prepared the old chicken coops so that they will be ready for use when needed? If not, you had better do it now, as you may be too busy to fix them when they are needed.

HYBRID ORANGES.

A Washington dispatch is authority for the statement that a deciduous orange tree has been produced—a variety which will grow farther north than oranges can now be made to grow. Of course such a hybrid would be welcomed, that is, if it shall produce as good a fruit as the orange grown in the usual way, but it should be remembered that innovations in fruit culture are as likely to occur as they are in the vegetable kingdom, and we may obtain even more advanced perfection in orange culture than has been reached.

Discussing the socalled "vital discovery" Albert Woods, of the Plant Growers' Bureau, says:

"It is in the second generation that the hybrid breaks up," and it is in this breaking up process, as we call it, that we will get a great variety from which to select. What we have now in this first hybrid is an orange which combines quite equally the traits of both parents, from the Florida orange it gets juicy and almost seedless interior, while from its Chinese parent it gets its reduced size and its tart flavor. The tree combines the characteristics of both, but from the hardy one it gets habits of being deciduous and its ability to resist frosts.

"Even if we never should get anything more than we now have in this hybrid, we would consider the acquisition of great value. This small orange, capable of growing in fifteen or twenty states where oranges cannot now grow, although inferior to the ordinary orange of commerce, would have commercial value for orange drinks, extracts, and other purposes. In taste, it combines the characteristics of the orange and the grape fruit, and resembles in some respects the lime."

Alexander G. McAdie, Section Director, reports the following condition of crops for the past week. The summary including the state at large.

Generally clear weather prevailed throughout the state during the week, with nearly normal temperature and fogs in the coast districts. Conditions were favorable for ripening late fruits and raisin making except along the coast, where curing was retarded by moisture. The second crop of raisins in the San Joaquin valley is curing rapidly and going into the packing houses; a third small crop is on the trays in some vineyards. Heavy shipments of raisins and table grapes continue and the wineries are in active operation. Prunes are dried and under cover; the yield is considerably below average. Apple picking and shipping are in progress. Nearly all deciduous fruits and grapes have yielded excellent crops in most sections. Oranges are ripening rapidly and picking will become general in the Oroville and Porterville districts during the present week; the first carload was shipped from Porterville October 29. Southern California oranges are reported in excellent condition, with indications of an unusually heavy crop. Olives in the San Joaquin valley are doing well and give promise of a fair yield. Walnut picking is nearly completed.

Grain, hay, hops, beans and sugar beets are practically all harvested and sheltered; the crops on the whole have been very satisfactory. Egyptian corn harvest and potato digging are progressing. A few farmers are plowing and seeding, but the work will not be general until rain has fallen.

LAND AND WATER.....

BY A. J. McCLATCHIE, PHOENIX, ARIZ.

TONTO DAM.

In accordance with recent orders by the Secretary of the Interior, contracts have been let for the construction of some of the works preliminary to the erection of the great Tonto Dam itself. This, the first dam to be constructed under the provision of the national irrigation act of 1902, will also undoubtedly be the largest and most expensive. The reservoir that it will create will impound approximately, 1,500,000 acre-feet of water, or enough to cover a million and a half acres with water one foot deep. The average amount required annually for crop production in the region under it being about five acre-feet per acre, if the reservoir could be filled each season the water from it would thus be sufficient to irrigate nearly 300,000 acres. But past experience shows that only during exceptionally rainy seasons will its full capacity be tested, and that during average years less than a third of the above amount of land, in addition to that already being irrigated, can be supplied with water from the reservior.

* * *

According to computations made by the writer (based on the river flow during the past fourteen years) and published in Bulletin No. 43 of the Arizona station, the amount of land that it will be safe to attempt to irrigate from the regular flow of the Salt river, and with water stored in Tonto reservoir during flood times, lies somewhere between 160,000 and 200,000 acres. But this would be about double the area now properly irrigated, and the crop production of the region would undoubtedly be more than doubled. Besides this increase in the production of staple crops, the possibilities of intensified and diversified cultivation would be so much greater that more valuable crops could be grown with the regulated water supply than is practicable with the present fluctuating supply. The ability of the region to support population will therefore undoubtedly be increased two or three fold.

* * *

But one of the greatest benefits to come from the creation of the Tonto reservoir will be the resulting stability to agriculture and horticulture, and the consequent stability of land values. The fluctuating water supply has caused an element of uncertainty that has discouraged the making of permanent improvements and the study of improved methods of farming. With the completion of the Tonto dam ought to begin an era of more intelligent farming here. The thought and time can be given to reading agricultural books and papers that is now spent in speculating on the water supply.

All of this will mean increased trade with California, whence comes a large part of all that is consumed here. There will always be many agricultural and horticultural products that can be more advantageously purchased from California than grown here, and a great variety of products of all kinds will continue to come from there. Consequently the prosperity of Arizona is closely linked with the welfare of California.

* * *

The cost of the Tonto dam, approximately $3,000,000, will be practically a loan by the government without interest, and will be paid in ten annual installments by the farmers who use water from the reservoir. As there is already more land in private ownership under the reservoir than can be properly supplied with water from it and from the river flow, no government land is to be irrigated. There will be therefore a resulting increase, not in the area of irrigated land, but in the area of land properly irrigated. To be sure much of the area has been irrigated but once, in order to secure title to it under the Desert Land Act.

While this increase in the water supply of the region about Phoenix will make homes for a large additional population, the danger is that the resulting influx of settlers will be out of proportion to the augmentation of the water supply. Although irrigating water has been scarce during the past four or five years, and although the completion of the Tonto reservoir is necessarily several years distant, already settlers are coming in singly and in colonies. Unfortunately, some real estate men and others who have land for sale, are not over scrupulous in the matter, and are apt to induce settlers to come here too soon or in too great numbers. This is liable to result in the temptation to deprive the older settlers of water to which they are entitled by right of prior appropriation, just as the construction of the great Arizona canal through the upper part of the northern side of the Salt river valley resulted in a larger number of farmers than ever before receiving too little irrigating water. As long as land is in excess of the water to irrigate it, and there is no adequate supervision of the distribution of the water supply, so long will all cultivators be constantly in more or less danger of a curtailment of their supply of irrigating water. But it is to be hoped and is confidently expected that the government will so administer the reservoir matter that there will be no resulting avoidable hardships to any. In this will lie one of the greatest advantages of the construction of irrigating works by the government over construction by private capitalists.

* * *

MEASUREMENT OF WATER.

The use of the term "acre-foot" in speaking of the capacity of the Tonto reservoir suggests a discussion of the significance and use of the term. For it is such a convenient and so accurate a one that it is to be regretted that it is not generally adopted by farmers, as it has been by irrigation engineers and most other writers upon irrigation matters. The early and long-time use of the term "miner's inch" makes it difficult to introduce new terms, no matter how much preferable they may be. Though it is quite generally admitted that it is difficult to comply accurately with the requirements in measuring water with he miner's inch as a unit, its use continues to be general. But there being a lack of uniformity in the conditions under which a miner's inch is to be measured, the amount of water expressed by the term is plainly not a definite quantity.

The second-foot and the acre-foot are terms that express definite quantities wherever they are used, and are understood the world over. A second-foot being the flow of a cubic foot of water during each second of time, a second-foot flow for any definite period equals a definite number of cubic feet, and it thus becomes easy to compute just how much water will flow upon a given piece of land in a given time. The number of square feet in an acre of land being very nearly the same as the number of seconds in twelve hours, a flow of a second-foot during that time covers an acre with water to the depth of about one foot, or approximately one inch deep each hour.

The acre-foot and the acre-inch are therefore directly comparable with the rainfall. An acre-foot of water applied to an acre is equivalent to a rainfall of twelve inches, and an acre-inch applied to an acre is equivalent to an inch rainfall. But between the miner's inch and the rainfall unit there is no such relationship. If California wishes to translate second-feet into miner's inches, they have only to remember that in their state the latter equals approximately one-fiftieth of the former. In Arizona, by common consent forty miner's inches are equivalent to one second-foot. But the use of the word "inch" in such a different sense than it is otherwise used is misleading and confusing. The general adoption of the second-foot, the acre-foot, and the acre-inch as units of measurement would be a long step in the direction of accuracy and simplicity in the measurement of water and of the discussion of the amounts of water needed by and applied to various crops.

* * *

EUCALYPTUS FOR ELSINORE.

H. D., who writes from Ventura expressing disappointment at what has appeared upon Eucalypts in a Los Angeles horticultural journal he is taking, and asks for information as to what variety to plant upon damp and upon dry soil at Elsinore, is referred to the articles upon Eucalypts for dry hot regions that have appeared in recent issues of the Cultivator. Of the species discussed in those articles the ones best suited for the low lands about the lake will probably be E. rudis, E. rostrata, and E. crebra, and for the higher situations, E. polyanthema, E. tereticornis, and E. corynocalyx. Some of the readers of the Cultivator who live in the vicinity of Elsinore could send specimens from each species growing in the region, it would enable the writer to give more definite information as to what species may be grown there.

TOKAYS CRACKED.

Editor Cultivator.—I have Tokay grapes set out two years ago from one year roots, that I believe have too much water, being set out at the edge of a lawn. This year the grapes cracked before ripening. Did they have too much water and can I move them, if so, at what time?—Sanford Rich, Hollywood.

The vines evidently got too much water. Mildew will do the same thing even when Tokays suffer for water, but if these grapes received too much water they are pretty sure to crack and are sure to develop a poor flavor. The vines may be moved, the best time being soon after the leaves have dropped.

* * *

SOUR ROOT.

Editor Cultivator:—What is the cause of sour root of deciduous trees and the preventative and cure. The soil is a black sandy loam on live oak land.—S., Arroyo Grande.

Sour root of deciduous trees is caused directly by a ferment that gets in the sap. How it gets there is often a mystery. The disease is so little understood that no known remedy is as yet given. In fact when the disease is so far advanced as to make itself manifest, there is no hope for the tree. There being only theory advanced as to how the germs of fermentation gain entrance into the circulation, we can give no preventative. It may get a start through wounds in the bark by careless cultivation, or by the bites of insects, Sour sap is often caused by rise of the soil water, or by poor drainage where irrigation is practiced.

* * *

ORANGE SEED BED DISEASE.

Editor Cultivator:—Can you tell me the cause of and remedy for the dieback or rotting of the bark just under the surface of the sandy loam in my orange seed bed plants? One bed is ruined and another is going fast. The trees seem to be O. K. until they are from one to three inches high and then die suddenly. I believe the trouble is not a new one and I feel satisfied that it is not caused by too much water.—Subscriber.

The trouble is known as "damping off" and is one of the most troublesome diseases in seed beds. It is generally caused by too much water and sometimes by flooding after the young plants have been allowed to get a little too dry. It is caused directly by a fungus which spreads rapidly from one plant to another. If one bed of seedlings is badly damaged, it will be expedient to spray with Bordeaux mixture. This will ruin the young seedlings, but they will die anyway, and the spraying will destroy the fungus that makes the disease. This fungus will live and grow after the soil has been allowed to lie bone dry for a season, as soon as the proper conditions occur. In order to avoid damping off, keep the beds as sunny as possible and have a good under drainage. When it once makes its appearance, parts of the beds infected may be sprayed and thus check the trouble. If it once gets well spread through the beds, there is no remedy known that will not also injure the plants.

* * *

KING ORANGE.

We are often asked for an opinion on the King orange, if it is a desirable fruit to plant for home use or shipping, etc.

This orange came into prominence a few years ago when it was announced that it brought eight dollars ($8) per box in one of the large eastern cities. We took pains to inform ourselves about that particular shipment and found that it had sold at the price stated, but it was paid by a speculator who carted the fruit around till a part of it was spoiled and he then sold the balance at some figure that was not particularly enticing to a grower. This information was obtained through the Southern California Fruit Exchange and we take it as correct.

The King orange is classed as a Tangerine and is much larger than the Dancy Tangerine and very rough and coarse in appearance. It ripens with or a little later than Late Valencia and is of superior flavor. If it could be handled properly in certain markets, it might find a limited demand. It comes at a time when other fruit floods both eastern and western markets and unlike the Valencia, it deteriorates very rapidly after reaching maturity. The tree is very susceptible to cold and recovers very slowly from a drying wind or severe frost. The fruit when once frozen, no matter how green, will not recover as Valencias or St. Michaels seem to do, but develops much pith and becomes puffy. We should not recommend it for planting even for home use except where frost is very light and drying winds are not severe. It fills out the season with Valencias as the Dancy Tangerine does with the Washington Navel. Taking it all in all, we much prefer the St. Michael, it being much finer in grain and lasts over a longer period than the King.

* * *

GINSENG AGAIN.

Nearly every mail brings us inquiries about raising ginsing in Southern California. We have discouraged it in recent articles and hope the following will be strong enough to deter our readers from considering it further. The ginseng fever bids fair to rival the Belgian hare craze that swept the country recently. Circulars are being circulated setting forth the immense profits derived from it, and like the hare craze, those who have stock to sell will reap a rich harvest. We hope the experimentors will start out on a very small scale. The Maine experiment station has the following in part to say on the subject:

"The plant is a native of cool, moist, shady situations, and is soon killed if exposed to the glaring sunlight. It usually thrives best in moist loamy soils such as are found in oak or maple forests in the north (of Maine). Seed is sown as soon as ripe in September. The bed is covered with leaf mould and brush to prevent drying and cracking of soil. Eighteen months are usually required for germination. When the seedlings are two or three years old, they are transferred to permanent beds as carefully prepared as the first. The plants are set four to six inches each way and are not again disturbed, except to keep the weeds down, until the harvest time; which will be in four or five years from transplanting, or six or eight years from seed. Transplanting is best done in the fall and the roots are set so that the buds for the next year's growth are about three inches below the surface of the ground. The roots should not be cut or trimmed. After the roots are set, a lath shed should be built over the entire area covered.

The roots of cultivated plants are usually larger and more uniform than those from the wild and bring from 50 cents to $1.00 more per pound. The long time required for returns will, however, deter most people from undertaking the work of cultivation. In general, if an experimental bed is determined upon, it is wiser to purchase seedling plants rather than attempt to start seedlings. But (here is where we urge attention.—Ed.) no one should be deceived by the glowing accounts of possible fabulous returns from the enterprise. The present high prices are said to be maintained by a syndicate of Korean merchants who control the native product. On the other hand, the demand for the article is apparently limited only by the exhorbitant price and with an increased supply and consequent reduction in price will come an increased demand for the roots.

The experiment station would not encourage ginseng culture in Maine, but those intending to attempt this industry would do well to purchase the little booklet "Ginseng," by M. G. Kains, published by Orange Judd Company, New York; also Bulletin 16, Div. of Botany, U. S. Dept. of Agriculture."

The above was published in September by the Maine Experiment Station as a warning to those who are attracted by glowing accounts of firms having seeds and roots of ginseng to sell.

A MONOGRAPH
ON THE
ORANGE AND LEMON

Is yours for the asking. It treats on planting, cultivating, pruning, irrigating, harvesting the crop, and all the leading varieties. Fully illustrated with many fine half-tone engravings showing typical orchards, with a description of our methods for producing vigorous citrus trees that will grow and are true to name.

SAN DIMAS CITRUS NURSERIES
SAN DIMAS, CAL.

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

CALIMYRNA FIGS

(*Genuine Smyrna Fig of Commerce*)

The only Fig that is fit for commercial purposes. It has proven a grand success in California, and orchardists should not hesitate to plant liberal acreage. "The Smyrna Fig at Home and Abroad," by Geo. C. Roeding, 87 pages illustrated, sent postpaid, 25c (stamps).

Contracts made now for delivery 1904.

Deciduous, Citrus and Ornamental Trees and Rose Bushes.

Finest and most complete Nursery Catalog published mailed for five cents postage.

RESISTANT GRAPE VINES

Sole agents in the United States for largest Nursery in France growing Resistant Grape Vines. In addition to this we are also large growers of Resistant Grape Vines ourselves. Quotations given on rooted Resistant Grape Vines, grafted to the leading varieties of table and wine Grapes. As we handle in car lots we can make very low prices.

PAID UP CAPITAL, $200,000
FANCHER CREEK NURSERIES Inc.
GEO. C. ROEDING, PRESIDENT AND MANAGER
P.O. BOX 14 FRESNO, CAL.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so faras possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

A B C OF INSECTS.

(Continued.)

FAMILY COCCIDAE.—We complete our survey of this bug order with an account of the scale insects. As these are the arch enemies of the citrus fruit grower, all will read with interest aught regarding their life and habits. These are easily told as after a few days of active life, just subsequent to hatching, they assume the form of scale, move but little, but from their countless numbers, they suck quantities of sap, and so are a fearful drain upon any tree or shrub that they may infest. There are three well marked sub-orders, the Coccinae, which contains such insects as the mealy bugs which are always active are not scale form, and furnish such useful articles as carmine and shellac. Some of them are very destructive, as witnessed in the mealy bugs, and unfortunately they are equally hard to conquer. The second suborder, Lucaninae, includes such insects as the black scale and the soft brown scale. These anchor soon and then move not at all, or at least very little, unless much disturbed, and when we touch the scale we touch the insect itself. That is, the scale is the insect. Most of these, like the black scale are oviporous. That is, the mature insect lays her eggs under her body, after which she dies, though she still hides the eggs with her carcass. A few, like the soft brown scale are ovoviviporous, or in other words, the mature female does not lay eggs at all, but the eggs hatch inside her body, and the young are born alive and active. The third sub-order is the Diaspinae. Our common red and purple scale and the San Jose scale belong here. In these, after a few days of activity the insect secretes a cover which with a center of two cast skins or moults form a close snug armour, which conceals and protects the scale. In these when we touch the scale we do not touch the insect as the latter is concealed and protected by this armour. These are often referred to as the armoured scales. Most of these I think do not lay eggs, though a few, like the purple scale lay eggs under the armour. These are harder to kill than the other scales. They also hatch more unevenly, and so for a double reason are more difficult to kill than are the unarmoured scales. All scale soon after they commence to work their force pumps, secrete a kind of nectar of honey dew. This attracts a black fungus, and it is this that makes the leaves smutty, and makes it necessary to wash the fruit. This also attracts bees, which repel birds and other enemies of the scale, and so we see that the honey dew is protective to the insects that secrete it. Many scale like the red and San Jose, are hatching all the time in summer, and so we find them of all sizes on the tree at all times. This is more or less true of the black scale. Though along the sea shore they too are hatching very irregularly. Even inland, the last few years, they have been hatching with provoking irregularity. For two or three years just before this, I could find scale of all sizes at every month of the year. This year, for some reason, they have come out very uniformly, and so are much more easy to fight. May this not be because of the cool year? The exceptional cool weather of the early season would surely retard development and might be supposed to secure more even hatching. If this be the cause it would be interesting to have the full proof, as such years would be the ones to choose for either fumigating or spraying, as either thoroughly done would give very perfect riddance of the insects for a long time. I believe that very thorough fumigation or spraying in our inland orchards would suffice for three years. It is surely true that where we have uniform hatching if treatment is required every year, a very poor piece of work is done.

There is no doubt but that a thorough fumigation will kill all young scale insects, and if a strong dose is used the mature insects and the mealy bugs can be destroyed. Mr. Payne believes experience shows that if this heavy charge of cyanide be given on a very cold night the trees will not be injured. If fumigation on a cold night will permit a charge that will kill the old scale and the mealy bugs and not injure the trees, it will be very important to have the full proof.

There is one truth that is big with promise in this matter of scale depredations. I refer to the fact that almost all insects, even the scale, have enemies in their native home that are able to hold them in check. If these enemies could always be introduced with the insects, then they would continue to hold them down and we would be less troubled. If we could introduce them later the matter would need to give us little worry. When the Vedalia was brought here the Cottony Cushion Scale lost its potency for evil. We may hope that the Scutellista bids fare to do as well in case of the black scale. May we not hope that a similar cure awaits discovery with all these and all such pests. That the white fly of Florida, and the orange maggot of Mexico, have not such checks is indication that they are not native to those regions.

* * *

GRUBS.

M. S. Phillippe, Campbells, Cal., sends me some grubs found about his bee hives which interest him and of which he wishes to know more. These are certainly the larvae of beetles, or grubs. These were so crushed that I could not determine just what they are. Only the head shield remained intact. Soft insects should not be sent loose in a letter. I do not think Mr. P. need have any anxiety about these grubs as they are probably an innocuous species.

* * *

TAILOR BEES.

Mrs. Althea Scudder, Santa Ana, sends some leaves which have circular and oblong pieces cut from them by some insect. She thinks it must work at night as she has never observed it at work. These insects are the tailor or leaf cutting bees. They work in the day time and cut these pieces to be used in making their cells. They work principally on the rose and do very little damage.

* * *

SULPHUR WITH DISTILLATE FOR RED MITE.

William H. Watt, of Upland, writes that he has found that distillate spray properly applied is sure death to black scale and red mite (red spider), but the latter requires frequent spraying. He says that there are no scale in his orchard but has the red mite galore. He found last year that dusting with dry sulphur in July was so efficient that now the orchard has very few of the mites. Another orchard recently given a thorough spraying for scale with two and a half per cent solution of distillate has countless living spiders. Mr. Watt wishes to know if it would not be possible to mix sulphur with the distillate. I have no doubt of the wisdom of combining these two insecticides. While I know that the distillate will kill some of the eggs, yet some of them will survive and so the work may not prove satisfactory. The effect of the sulphur will survive several days, as the killing is done by fumes which are constantly given off by the influence of the heat of the sun. It is found, however, difficult to mix the sulphur with the spray and unless great care is exercised, the fruit is likely to be burned. I would suggest that a stock solution made after the formula of the University bulletin of the sulphur and potash, be added to the distillate spray, the latter taking the place of the water as recommended in the bulletin. I have not tried this but believe that it would be effective, would not injure the fruit or clog the nozzle. I would certainly recommend Mr. Watt and others to give it a trial.

Last Monday while visiting the Upland orchards, we found a good many of these red mites and in all cases accompanied with black scale. I urged the owners in applying their distillate spray to mix this stock solution as recommended by the University and advised treatment at once, as the spiders increase very fast, and I see no reason for delay. Mr. Watt need have no anxiety in the matter of the sulphur injuring the spray. It would do no harm and would certainly add to the effectiveness of the insecticide whenever the orchard was infected with the red mite. It would be well, however, to experiment a little before carrying on the work in a very extensive way.

O. W. Prescott, Covina, wishes also to treat black scale and red mite. He wishes to know what per cent of distillate to use. Two to two and a half per cent is as strong as it should be used on the orange because of the thick foliage, if the work is thoroughly done there is so much added that there is danger if a stronger mixture is used. Mr. Pease, horticultural commissioner of San Bernardino county, strongly urges the use of the distillate from the Southern Refining Company, as he says he has never known that to injure, while other distillate frequently does damage.

* * *

BEAUTIFUL GOLDEN BEETLE.

F. M. Oliver, La Mesa, Cal., sends me the tortoise beetle. He speaks of it as a lady bird beetle, says he has never seen one before and wishes to know about it. Mr. O. is wrong in placing the insect. It is not a lady bird beetle at all but is one of the leaf beetles. The two families are often much alike in form, but the leaf beetles can always be told by their longer antennae, which are always plainly visible. To see these organs in the lady bird beetles, one has to look carefully. These beetles are well called tortoise beetles as they are much the form of a turtle. Some of these beetles, and the one sent is a sample, are of a beautiful gold color with a metallic luster that is almost startling. Unfortunately this splendor disappears upon pinning the insect. The species sent by Mr. O. belongs to the genus Coptocycla. I have known these insects to work on the sweet potato and ground cherry, a species of the solanum family, in the state of Michigan. While the leaf beetles are usually quite destructive, as they infest foliage both as larvae and imago, yet I think these tortoise beetles are rarely numerous enough to cause alarm.

* * *

CULTIVATING THE WALNUT.

Chas. L. Partridge, Redlands, desires information with regard to walnut growing. I know of no work that treats of this subject. There have been excellent papers given at our farmers' institutes which I think were published in the agricultural journals. It would certainly be desirable for any one who wishes to study the subject to visit some one who has made a succes of walnut growing. One could certainly get a wealth of information and learn very fast by spending a day with such a man as Mr. E. G. Ware, Garden Grove.

* * *

SPOTTED LEMONS.

T. West, San Diego, sends lemons that are badly marked. These are only samples of what have come from many places. Last Monday I visited with Mr. Pease and Inspector Goodrich two orchards in Upland where the fruit was very badly marked. It is our opinion that the first cause of this spotting of fruit is insects. The sun also tends to emphasize the insect scars and very likely the spray or fumigation will further deepen the injury. The fact that all the marred fruit is towards the sun shows clearly that the sun is a leading factor. It seems almost certain that thrips and red mite, of which, as I recently stated, there are two species working in the orchard, have been the chief cause in this extensive spotting of citrus fruit this year.

I think that people are very apt to magnify the amount of damage in looking at trees, especially if the spotting is very bad. One is very apt to say that fifteen or twenty per cent of the fruit is damaged, when by actual count it will simmer down to three or four per cent. Even the worst orchards that we have examined will, I think, show very little damage when it comes to the marketing. Usually not very many trees are seriously affected, and in these cases the number of injured fruit on actual count is far less than one would suppose upon a hasty inspection.

GO TO GARDENA

Where the alfalfa grows so luxuriantly, giving from 6 to 8 cuttings per year, and producing when fed to cows a superior product of milk and butter—the secret — there being no alkali to detract from the purity of the milk, as demonstrated by the noted Strawberry Brand of Butter made by Mr. Davis of Gardena. The success of our Chicken Ranches depends upon having green alfalfa as a food product in the production of eggs at a time of the year when the dry ranch farmer has no green feed to make the hens lay. Our small alfalfa, dairy and chicken ranches are making good livings.

FOR SALE, 6 ACRES, $2400

Set to walnut trees, interset with bearing fruit trees. Berries, one acre of Rhubarb, etc.

For Sale, House and Lot, $1200

4 big rooms, closets and pantry, entrance hall and good grounds.

For Sale, 11 Acres, $3200

House, barn, good pumping plant. Good celery or alfalfa land. A bargain.

FOR SALE, 20 ACRES, $4,500

$1,500 in improvements. Good house, barn, etc. Berries, alfalfa and fruit. Terms, $2,000 cash.

FOR SALE, 5 ACRES, $2000

Four-room house, 3 acres of young strawberries, balance alfalfa and garden. Five tons barley hay. 3 tons alfalfa, horse, cow, chickens, buggy and farming implements.

FOR SALE, 5 ACRES, $1400

2½ acres of new strawberries, good water right.

FOR SALE, 16 ACRES, $7,700.

A profitable farm with 6-room house, 2 large barns, chicken houses and corrals. Good bearing apple orchard, interset with Loganberries; 9 acres set out in young walnuts; ½ acre peaches; ½ acre raspberries; ½ acre strawberries; 1 acre rhubarb; 1 acre young vineyard; 2½ acres in alfalfa, and 3 acres to be seeded to alfalfa.

FOR SALE, 8 ACRES, $4,000.

Two acres blackberries, 3 acres alfalfa, ¼ acre loganberries, and a good family orchard. A 4-room house, seeas, corrals, etc. Plenty of water for irrigation and domestic use.

FOR SALE, 29 ACRES, $12,000.

One-half mile frow two electric car lines Seven-room house, barn, corrals, pasture, 17 acres alfalfa, 4 acres of strawberries, family orchard (all fenced) with a good pumping plant.

FOR SALE, 20 ACRES, $5,000.

One-half mile from car line and near school. Small house snd barn, a pumping plant, 2 acres of strawberries and 2 deep wells.

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

HORTICULTURE.

Olives are now ripening near Oroville.

The prune crop in Servia was poor, and the old stock is exhausted.

Florida will this season have a good crop of oranges and of excellent quality.

Some of the grape growers of Los Gatos are taking care of their fruit on the co-operative plan.

The grape crop near St. Helena this year was an average one. Prices ranged from $16.50 to $18.00.

Raisin packers in the Selma district estimate that about 3500 tons of raisins will be handled there this season.

The raisin crop of Fresno county this year is now estimated at 86,000,000 pounds. Last year it was 80,000,000 pounds.

Alex Craw recently sent to Cuba a colony of insects to destroy a parasite that is preying on the pineapple there.

The total shipments of fruit by the California Fruit Distributors at Sacramento, up to this writing, is about 7093 cars.

Since the commencement of the apple season the Atlantic Transportation line has shipped 120,000 barrels to London.

Articles of incorporation of the Vineyard Proprietors Wine Company have been filed at Santa Rosa. Capital stock $[illegible],000.

Prof. G. E. Colby, of the University of California, has discovered an instantaneous bleach for dried fruit. It is sodium peroxide.

Los Gatos grapes have been coming into the San Francisco market in large quantities for two weeks. The growers were paid from $18 to $25 per ton.

The California Fruit Distributing Association claims that it now superintends the shipping of 95 per cent of the fresh deciduous fruits of California.

The Los Gatos canneries are labeling, casing, and shipping something over 2000 cases per day. They have difficulty in securing cases as fast as they need them.

The citrus fruit crop of Southern California which will begin soon to start eastward, will approximate 35,000 carloads or 10,000 more than any former year.

The Fruit Grower's union of Santa Clara county have shipped at this writing, about 85 tons and received over 200 tons. A dividend of 35 per cent was declared last week.

A car was loaded at Sebastopol, one day last week, with 1430 cases of fruit weighing 86,000 pounds. That, it is said, is the largest car load of canned fruit that ever left Sonoma county.

J. C. Adriance, at the Napa Farmers' Institute last week, recommended spraying twice each year for pear fungus. He uses 5 pounds of blue stone and 5 lbs. of lime to 50 gallons of water.

The Fisher-Meritt Fruit Company of Geyserville is running night and day grading prunes. The company has purchased so far about seventy-five tons at prices satisfactory to the growers.

Tehama county would seem to be the natural home of the pear. D. S. Cone, five miles from Red Bluff, realized $29,500 for his crop of Bartlett pears raised on 100 acres—nearly $300 per acre.

The prune drying season is over. The natural conditions for curing could not have been better in Central California. The crop in the Santa Clara valley is only about half that of last year. Some dried prunes have been sold for 2¾, but the growers are holding generally for 3¼ to 3½. The old stock has been nearly cleaned up. Most of it was sent to Germany.

Tehama county is becoming noted as a fig producing section. They produce there the product from the "female fig" first imported into California by Senator Stanford. It is of the Smyrna variety.

Jesse Teague exhibited in Visalia, one day last week, a large bunch of black berries known as the "Evergreen." The branch also supported several white blossoms. And this was the last part of October.

The Vineyard Proprietors' Wine Association of Sonoma county, just organized, is meeting with much encouragement. Ten thousand tons of grapes have already been promised to the project. The capital stock is $100,000.

After testing twenty-seven different methods of canning cured olives, S. M. Gifford of San Diego, has succeeded. The fruit, as put up by Mr. Gifford, has a fine flavor. He will erect a cannery immediately and launch his new article.

December 3rd has been the date fixed by the Inter-State Commerce Commission for the final hearing of the case of the Southern California Fruit Exchange against the Southern California Railway Company over the controversy of routing fruit.

Geo. B. Katsenstein, manager of the Earl Fruit Company at Sacramento, says: The outlook for California dried fruits is very bright. There is an increasing demand for our product. In time this will become one of California's leading industries.

The dried fruit market of Los Gatos continues dull. There seem to be few buyers in the field, and growers who call on the packers are informed that the price on prunes ranges from 2½ to 2 5-8 basis. The growers at this writing are unwilling to sell at those prices.

There is a cherry orchard on the Stevens road, in Santa Clara county, of twenty acres, for which the owner refused $30,000. The secret of the great value is that the owner knows what trees to plant and how to cultivate them. He is getting rich while some of his neighbors who have cherry orchards equally as large, can scarcely make ends meet.

The Minnewawa ranch, in Fresno county, has demonstrated that it pays to do farming thoroughly. They do no careless, hap-hazard work, from raising calves to fruits and grains. Last year they sent east six car loads of Emperor grapes which were sold for more than $200 a ton, or for $15,000 for the lot. This ranch is owned by Dr. W. N. Sherman, of Fresno.

A. S. Simpson, manager for Castle Brothers, dealers in dried fruits and nuts, at Sacramento, recently said the present outlook for dried fruits is the best we have ever known. We have commenced shipments and expect to ship over 250 car loads. Of this we shall send about 100 car loads to Europe. The demand for California dried fruits abroad, especially in Germany, is simply grand.

The Italian-Swiss colony of Sonoma county, banqueted 150 bankers last week who were attending the National convention. The visitors were shown the immense winery near Asti and the process of making wine. They were surprised at seeing a wine tank that holds five hundred thousand gallons. The financiers were banqueted out doors, which was also a surprise to them, considering the time of year.

Probably one of the greatest strawberry centers in the world is at Florin in Sacramento county. Up to August 5th, 1902, the season's shipment of strawberries from Florin amounted to 1095 tons, which sold for $131,400, or as high as $800 per acre. This season's crop is estimated at 200,000 crates of fifteen pounds to the crate. The principal berry raised at Florin is the "Dollar berry" and the "Jessies."

CONTINUED

AGRICULTURE.

Tehama county's peach crop this year is given as about 40,000,000 pounds.

El Monte has been shipping quite a quantity of walnuts. One car load realized $3500.

The price of hay near Stockton has, quite recently, dropped from $2.00 to $3.00 on the ton.

Anspacher Brothers, of Livermore, are importing seed wheat for the farmers from Australia.

The Spreckles sugar factory is running to its full capacity, slicing 3000 tons of beets daily.

In 82 days, says the Chino Champion, 59,415 tons of beets were sliced at the Chino factory

Beans are slow sale. One grower in the Santa Monica district sold 8000 sacks for 3 cents flat.

The lima bean crop raised on the Limoneira ranch, near Santa Paula, will make about 5000 bags.

The bean crop this year in the Santa Maria valley is but 100,000 sacks. Two years ago it was 200,000.

Beans in Ventura county are slow sale. The price is down to $2.50 for limas and $2 to $2.25 for black-eyes. Growers are disgusted at such prices.

O. E. Bremer, of Sonoma county, has placed on exhibition with the State Board of Trade, some splendid specimens of chestnuts grown in his county.

Tehama county has now come forward with the claim that it can and does excel in sugar beet production, in that their beets contain 25 per cent of sugar.

The Goldman Colony management will soon have their twenty-acre tracts on the market, but no tract will be sold unless properly irrigated.

The expected rise of the price of hops in October did not come. The growers still contend they will go to the 25 cent mark or higher.

The wheat output of California this season, is now known approximately. It is only half a crop, or 500,000 tons The barley crop is estimated at from 500,000 to 575,000 tons.

The greatest asparagus canning and shipping district in the world is in Sacramento county. Here the canning of asparagus was originated. Now the canned vegetable is sent to all parts of Europe.

J. F. Burgess of Sonoma county, gave the editor of the Santa Rosa Republican samples of walnuts grown on his ranch. The nuts are fully two inches long, and with their coverings, as large as big pears.

The Sacramento Chamber of Commerce says that cultivated orange orchards in that valley, ten years old, are worth $1000 per acre. Ten acres of orange trees ten years old, will nicely support a family.

LIVE STOCK.

The Watsonville creamery is making 400 pounds of butter daily.

About two car loads of eastern poultry arrives at San Francisco every week; they bring good prices.

The Sonoma County Poultry Association has formed another branch association. This one is at Penngrove.

Last year 1850 car loads of poultry and eggs were shipped into California from eastern points, and yet this state is peculiarly adapted to the raising of chickens.

Several capitalists of Santa Barbara have formed a corporation to engage in cattle raising in Mexico. They have leased 350,000 acres and will do an extensive business.

A plea has been made by a citizen of Tulare county in behalf of the chicken hawk. He says one hawk will kill more squirrels than a man hunting them for the bounty offered.

Sheep, to the number of about 5000, have died in the reserve above Crane valley. The rangers found them in the reserves and drove them out and scattered them, hence the heavy loss.

The ranchers of Santa Clara county are alarmed over the movement of the Bay City Water Companies, which are trying to divert to their use the rainfall of the water sheds of that county. Indignation mass meetings are being held and money subscribed to prevent this menacing injury.

H. Parnhan, residing not far from Pleasanton, owns two cows. He delivered to the Santa Rita creamery in thirty-one days 1674 pounds of milk in which time he received for the milk $17.65, or nearly $9 for each cow. Two weeks of this time he fed two calves from the milk from the same two cows.

MISCELLANEOUS.

An electrical gridiron is a late invention to kill flies.

Twenty thousand people emigrated from Norway to the United States last year.

Redwood lumber has recently advanced $1.00 a thousand feet for the export trade.

Fresno county's system of irrigation includes 300 miles of main canals and 5000 miles of branches.

Last year Sonoma county produced $64,685 worth of quick silver, and large quantities of good mineral paint.

Red Bluff has a factory that manufactures and sells in Hawaii, Australia and the Philippines 100,000 doors annually.

During the past fiscal year the United States bought from foreign countries tropical fruits to the value of $22,000,000.

Twenty-eight California counties have arranged to prepare individual exhibits at the St. Louis exhibition. The exhibits of the other counties will be consolidated.

On November 1st the Southern Pacific Railroad advanced the rates on lumber shipped from Portland to San Francisco from $5 to $7.50 per ton.

The Southern Pacific Company is proposing to run all its locomotives with oil fuel. To that end it will own its own wells. It has already bought several wells at Bakersfield, paying $1,525,000 for them, and is negotiating for others.

The Chamber of Commerce of Sacramento, in its publication says: "After ten years of experimenting the fact has now been demonstrated, that so far as California is concerned, the Sacramento valley is both commercially and in quality the natural home of the orange.

Manager Briggs, of the State Board of Trade, has sent letters to the leading citrus growers north of the Tehachipi, asking them to join in a proposed citrus fair, to be held Thanksgiving week in the nave of the Ferry Building at San Francisco.

The California Promotion Committee has commenced a systematic collection of newspaper clippings, which will be pasted into scrap books, and placed with the State Board of Trade, for inspection by easterners. Every county will be given a book. Contributions of clippings descriptive of industries are solicited.

The last legislature passed a law to regulate the sale of perishable products on the water front of San Francisco. The law provided that all persons selling on state grounds should have a permit. In that permit the signer agreed to engage in no boycotting or engage in no discrimination as to selling. It is now charged that commission men, have flagrantly violated the conditions of the permit and the object of the law has been defeated.

The Grangers are pushing their cause in Sonoma county. Meetings from now to August of next year have been provided for as follows: First Saturday in November,; Bennett Valley, second Saturday in December; Santa Rosa, third Wednesday in January; Geyserville, second Saturday in February; Glen Ellen, first Saturday in March; Santa Rosa, third Wednesday in April; Petaluma, second Saturday in May; Sebastopol, first Saturday in June; Santa Rosa, third Wednesday in July; Two Rock, first Thursday in August.

THE EMERSON DISC PLOW

Superior to All Others

This plow is better constructed and has more adjustments and is adapted to a greater variety of soils than any other disc plow.

Has steel beams, adjustments are simple, is ball bearing, and will turn square to right or left.

Descriptive matter mailed on application.

NEWELL MATHEWS CO.

200 N. Los Angeles St.

Los Angeles, Cal.

C. H. SESSIONS, ASSOCIATE EDITOR

CAKED UDDER.

For caked udder the Dakota Farmer gives the following: "Bathe the affected part with the following, rubbing for ten to twenty minutes at a time: Distilled extract of witch hazel, 3 ozs.; alcohol, 3 ozs.; iodide of potassium, 2 ozs.; fluid extract of belladonna, 1 oz.; dissolve the potassium in the alcohol, then add the belladonna and lastly the witch hazel. Use only on the part affected, both morning and night."

The above prescription will be made more effective if a drench of Epsom salts, molasses and ground ginger is administered and in addition the following is given internally three times a day: 15 grains of iodide of potassium dissolved in hot water, and 15 drops of fluid extract of poke root. Take away all heating feeds, such as cotton seed meal, corn meal and gluten. Feed cool and laxative food.—Jersey Advocate.

FEED WET.

Editor Cultivator: Which is best, to feed to milk cows, bran and oil cake dry or wet? Kindly answer through California Cultivator.—C. F. B., Santa Rosa.

You will get the best results by feeding the ration damp. See that the oil cake meal is not lumpy, however, when you feed it wet; mix well.

Address all communications to
DR. H. D. FENIMORE, Veterinary Surgeon,
642 So. Broadway, Los Angeles, Cal.

To the regular subscribers of the California Cultivator, answers to all veterinary questions will be given n this department free of charge. When an immediate reply by mail is desired, enclose on dollar. Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared.

DIARRHEA.

Editor Cultivator: Can you, through the Cultivator, advise me regarding treatment of a horse? He feeds well and seems to be all right but if driven faster than a walk he is attacked with scouring so bad he cannot be worked. If you can advise anything that will help him I shall be greatly obliged. He is about ten years old.—E. C. Smith, Watsonville.

Eucamphol, 2 ounces, water 1 pint. Mix and give ½ ounce by the mouth, with hard rubber, long stem syringe every two hours during the day. Water the horse at least one hour before driving.

* * *

WOUND OF THE NOSTRIL.

I have a colt that is about a year old. Some time ago it ran into a wire fence and cut a hole in its nose about 6 inches above the nostrils, so that it breathes through the opening. Could it be covered with a silver plate and skin made to grow over it?—R. Heacock.

If the edges of the wound were pared raw and properly sewed together and kept aseptic, the wound would heal without a plate.

WATERING DAIRY COWS.

Always give a cow all the fresh water she wants. The more water a cow can be induced to take into her system the more milk she will yield, all other things being equal. As the period of lactation advances, the amount of decrease of water taken into the system and the amount of milk produced are almost exactly in the same proportion; that is, the decrease of water taken in during one test was 19 per cent, while the milk decreased 20 per cent. In another test the decrease of water was 14 per cent, while the milk diminished 13 per cent.

This is not chance, but characteristic of cows. At the Wisconsin Experiment Station, in seven out of eight tests, the cows took more water into the system daily and gave more milk while eating silage than on cornfodder, thus showing that the rations that produced the most milk contained the most water. With silage fed there were 2.9 pounds of water for each pound of milk yielded.

Cows should not be allowed to drink very cold water, as it reduces the temperature of the body. They often take chills, and it requires a good deal of vitality to recover from the ill effects. The late Hon. E. F. Bowditch, of Farmingham, by experiment, found that by giving twenty cows water at a temperature of 92 deg. F. the supply of milk was increased 200 quarts per week, conclusively proving the value of warm drinks over cold, in winter.

Two experiments conducted at the Maryland station showed that water at 70 deg. F. gave better results than the same at 32 degrees. The cows ate more while on warm water than on cold. Now decide which is cheaper to warm water in winter with, coal at $3 or $4 a ton, or with hay and grain after the animal drinks.

It is an interesting fact that a cow in full flow of milk requires from one-fourth to one-third more water than when she is not giving milk, and a cow giving a large quantity of milk requires more than one not giving so much. Cows not giving milk require from 70 to 80 pounds daily upon dry feed, and from 100 to 120 pounds daily, when giving milk.

Above all things a cow should never be permitted to drink stagnant or impure water. Drinking stagnant water produces a feverish condition in the system, which is manifest by a ropiness in the milk. Samples of milk from cows that have been drinking stagnant water, when put under the microscope, will show them to be fairly swarming with life which has been taken into the system through the water.—Up-to-Date Farming.

It is estimated that more than one thousand more cows will be dairied in this section in 1904 than during the present year. This shows the progress in this industry among us, and this is but the beginning of an industry that is destined to become next to fruit in production and profit. Ten years more and the Lompoc valley, covering about 13,000 acres, will be practically given over to winter apples and dairying.—Lompoc Review.

Why Keep the Cow?

From the manner some dairymen keep cows we should judge they have no special purpose in view except to furnish employment for the children. A dairyman remarked this recently to the editor of the Cultivator. We asked him if he made his dairy pay. He said no, but he needed something for the children to do mornings and evenings. Of course his dairy don't pay. It never will until he runs it on a higher plane than he is doing today.

In the first place, he ought not to expect his girls to milk. They should find employment in the house helping the mother. In the second place, he ought not to trust to his boys to milk, for as a general rule they never milk a cow right. They only half milk her. They are noisy, full of play and have no interest in their work. They hurry through it and often leave the cow s with lots of milk in the udder. They complain that the cow is hard to milk, "won't give down" milk, etc. Of course a cow will not give down her milk if she is scolded, kicked or beaten. Dairy cows require to be kindly treated, gently handled and never made nervous. Too many people totally neglect every one of these rules and then complain that dairying don't pay. To be successful the dairy business means personal attention of an intelligent order. To get the best results one must surely like the work; feel a pride in the personnel of each cow and study every feature of the business. See that the cows have plenty of good, clean food, and water, comfortable quarters, and kind attention. Milk out the milk clean and be sure to milk at regular hours. If these few simple rules are followed the results will be satisfactory. In line with these suggestions 'Farm, Field and Stockman" offers the folowing ideas which are pertinent to the subject:

"Milking is an operation which requires skill, as it has an important effect on the amount and quality of milk given. Dairymen know that there are great differences between milkers as between cows and that cows will do much better with some milkers than with others. Indeed, good cows are often almost ruined by poor milkers.

The milker should avoid handling the cow more than is necessary, and he should make it a rule to do his work quickly and thoroughly. He should never go from a sick to a well cow without first cleansing his hands. The habit of wetting the hands with milk is filthy in the extreme and should never be practiced. Some people think it is necessary, but this is a mistake. The hands should be kept dry. If they are not, it is impossible to prevent drops of milk from constantly falling from them into the pail.

THE BEST COW.

The best cow for each one of us is the cow we like best to handle and be around. There is such a thing as incompatability of temper between the man and his cow ofttimes, and this fact often marks the line between success and failure. The man who loves his cows and cares for them as a man will who has this affection for his stock, will most assuredly receive, better returns from his labor than the one who simply tolerates his dairy. The man who takes pride in the Guernsey or the Jersey or the Durham should turn his attention to that particular breed.—Dairy Journal.

ANTI-GERM MEASURE.

Owing to the spread of diphtheria the origin of which has been traced to the dairies, the health officer of Los Angeles has made up his mind that a radical change must be made in the method of disposing of milk. If his recommendation is adopted by the council of the city of Los Angeles, an ordinance will be drafted which will require milkmen to leave milk in open vessels and not in sealed bottles as is now done.

The contention of the health officer is that disease is carried from sick room to sick room through the agency of the milk bottles, in this way diphtheria got its start, and has spread with alarming rapidity, until it is agreed some drastic measures must be adopted to put a stop to its ravages or an epidemic of serious proportions will result. With the open receptacle, which does not circulate between the dairy and the consumer, each case of disease is likely to be isolated so far as the milk is concerned. In this case, even if the housewife does not scald her milk dish, it will make no difference. If there is disease in the family the dairyman's conscience will be easy, for he leaves pure milk, and has his own clean vessels for delivery.

As an objection to a compliance with such a rule on the dairyman's part, it is urged that milk taken from the can is not so rich as that delivered in bottles. The milkman does not mix the fluid in his cans more than superficially, and accordingly a few customers are supplied with very rich milk, while the large majority get very weak stuff.

The new measure does not contemplate doing away altogether with bottles, however, but is designed to keep them from circulating between dairyman and consumers. The milkman will be allowed to take a customer's milk in a bottle, but he must empty it into the consumer's vessel.

CAN THE PERCENTAGE OF FAT IN MILK BE LOWERED BY SCANTY FEEDING.

In the case of short periods (ten days to three weeks) the results of the experiments seem to be entirely consistent with the conclusion that scant feeding or the feeding of unbalanced rations exerts an entirely insignificant influence on the fat content of milk. The results of all these experiments which have come to my notice are summed up in the following conclusions of one such test:

The animals are fed for two weeks on rations which were insufficient. The cows lost in weight, and in some cases there was a slight shrinkage in yield of milk, but the composition remained practically unchanged, indicating that it is the flesh of the animals that first declines when the aliment is insufficient.

In the case of long continued, scantily, and poorly balanced feeding, it seems to be clearly established that the fat content of the milk may be materially reduced below the normal. This is illustrated by observation upon cows in Norrland. During the period from January to May, Norrland cows are in general fed only a meager allowance of marsh hay, and are therefore in a very poor condition when turned out to pasture in June. The results of about 2000 analyses for these periods of feeding show that on rich pasturage their milk carried from 2.65 to 5.8 per cent, with an average of 4 per cent, of butter fat, and that on scant stable feeding the milk carried from 1.10 to 4.6 per cent, with an average of 3.25 per cent of butter fat. In discussing these results, the author concludes that the fat content of milk can not be increased at will by increasing a normal ration, but, on the other hand, that it can be greatly decreased by scant and poor rations. If a change is made from a deficient to a normal ration, the fat content of the milk will again be raised to the limit determined by the inherent qualities of the individual cow. This point is more or less generally accepted and is of practical importance in the case of ordinary feeding only, as it indicates that cows may be below their normal for some reasons, and that a proper ration may apparently increase the percentage of fat, when in reality it is only bringing the animals up to their normal quality of milk.—Report Bureau of Animal Industry, 1902.

TO ENRICH PASTURES.

The dairying industry has come to stay—are the farmers prepared? asks Stock, Farm and Dairy. It must be admitted that without pastures dairying would be impossible. But there are pastures and pastures. Some are naturally rich, many are not; it remains therefore to the farmer to bring the poor pasture up to the standard of the rich pasture, and to prevent the good pasture from deteriorating. But what means shall be adopted? It is a well-established fact that pastures rich in fertility pay better than those which are poor. This is to be seen every day by the prices ruling for the different lands. Even virgin soil are not all of the same value; there are certain indications of fertility in a greater or less degree obvious to an ordinary passer by, but still more apparent to the dairy farmer. If therefore virgin land differs in value, too great a stress must not be placed upon the fact that the soil is virgin. Many agriculturists, however, when asked why they do not properly cultivate land that has already been cropped, point in glee to the virgin soil; soil that may lack in fertility absolutely.

The only way to prevent rich soil from going back is to return some of the plant foods withdrawn in the production of milk, stock, or produce. If these plant foods be not replaced, the rich soil will cease to be rich, and must eventually starve the farmer in return for his starving the soil. Inferior land can be enriched by the use of fertilizers. By enriching pastures a larger quantity of stock can be grazed on a small area than on a very much larger area of unfertilized land. A very simple means whereby fertility can be maintained without breaking up pastures is to use a fertilizer specially prepared for top dressing. Apply as a minimum 1 cwt. of such fertilizer to the acre, and lightly harrow it in; the fertilizer can be scattered broadcast by hand or by machines specially made for the purpose.

Growing crops intended for hay should be top-dressed at once. The results will prove conclusively that by the addition of feritlizers pastures and greed fodder crops will produce richer and more abundant yields. Manuring does pay, but is necessary to consult a well-known firm should information be required. Try 10 acres, and compare with 10 acres unmanured. The only regret will be that the whole lot had not been properly fertilized.

...Hog Cholera Not Caused By Bacillus...

The Bureau of Animal Industry has just issued circular No. 41, devoted to a discussion of a form of hog cholera not caused by hog cholera bacillus. It appears that a course of investigation has been going on in the Bureau of Animal Industry which has led the experts engaged in the work to conclude that certain out breaks of what appeared to be hog cholera were in fact not that trouble at all, nor were they produced by swine-plague bacilli.

The disease resembles the old-time disastrous plague known to all farmers as hog cholera and is quite as contagious.

The report goes into an analysis of the symptoms which attend the atack and from which it appears that the period of incubation after exposure to sick animals, or after a subcutaneous inoculation of infectious material from sick animals, varies from five to twelve days, the usual time elapsing between exposure and visible signs of illness being seven days. The first symptoms noticed are that the pig is slightly indisposed; there is loss of appetite and listlessness, but as a rule nothing else on the first day. By the second day of visible illness the animal is usually very sick, hollow in flanks, and has a staggering gait. There may or may not be diarrhoea, and the feces are frequently blood stained. Almost with out exception the eyes are sore and the lids glued together. The symptoms just enumerated become gradually more pronounced until the death of the animal, which occurs as a rule within seven days after the appearance of the disease, and two weeks after the date of first exposure to infection.

The circular in conclusion says: "From the symptoms and lesions of the disease it will be seen that it is apparently identical in all particulars with the acute type of hog cholera, and that it is produced without the aid of the hog-cholera bacillus.

The fact that this particular type of hemorrhagic hog cholera is so similar in both symtoms and lesions to the ordinary hog cholera supposed to be caused by the hog-cholera bacillus, and that, by our methods of inoculation, without the presence of the hog-cholra bacillus, we have never produced a case of chronic hog cholera, have led us to suspect that possibly in all outbreaks of acute hog cholera there is some other agent besides the hog-cholera bacillus at work, and that in those cases of acute disease where the hog-cholera bacillus is found we have to do, not with a pure infection, but with a mixed infection by hog-cholera bacilli and the organisms which are responsible for the disease which we have just described. In fact, virulent hog-cholera bacilli have been isolated from hogs in which the disease had been produced by inoculation with infective material in which the absence of the bacilli had been proved by filtration, by cultures, and by the inoculation of rabbits or guinea pigs.

If such supposition is well founded it is quite evident what an important bearing it must have upon the prevention and treatment of hog cholera, and we hope to be able to decide this point positively when the experiments now under way have been completed.

Sufficient work has been done to show that this particular form of hog cholera may be prevented by those measures which have been found to be effective in dealing with ordinary forms of that disease—the isolation of sick animals and disinfection of all infected lots with carbolic acid and lime being sufficient to prevent a spread of the disease.

The question of special methods of treatment has been taken up and will be reported upon later."

CROPS FOR THE DAIRY FARM.

The dairyman must provide good milk-producing food for his cows every day in the year, very properly advises C. P. Goodrich, in the Prairie Farmer. They should have some succulent food—that is, food containing the natural juices of the forage plants. Corn will produce more cow food per acre than any other plant grown in the Middle West. So corn should constitute a large portion of the crops raised. A part of it should be put in a silo to preserve its succulence. Dry corn fodder is excellent food for milch cows, and some may be fed in connection with ensilage, as it helps to make a variety.

But corn as ensilage or dry cured is not, by itself, a perfect food for dairy cows; it does not contain much protein, and more protein they must have, if we are to get a good flow of milk. We ought, of course, to raise clover; every farmer ought to, to maintain the fertility of the soil. Clover is just about a balanced ration of itself; and it needs more protein to balance up the corn or ensilage. Clover hay contains about 7 per cent of digestible protein; but hay made from oats and peas contains over 9 per cent, so we ought to raise some of that kind of hay by sowing two bushels of peas to one of oats to an acre, and cut for hay when the peas are just fit for table use and before the oats have commenced to turn. But there is another crop that every dairyman who can, should raise, that is better than either of the other kinds of hay I have mentioned, and that is alfalfa. This contains 11 per cent of protein, which is amply sufficient by feeding say ten pounds of it, thirty pounds of corn ensilage, with some clover hay, oats and pea hay dry corn fodder by way of variety, to make a well balanced ration. Next to clover comes alfalfa, which is also rich as a cow feed.

When such coarse fodder is fed we can be entirely relieved from buying commercial foods to furnish protein. We can snap our fingers at the men who are selling bran at $20, gluten feed at $25 and all these high priced feeds, and say to them, "Keep your feeds we don't have to buy them." If there is not grain enough in the ensilage. we can make it up with cornmeal; and, if oats are not too high in price, we can have some of them ground to feed. In this way we can furnish our cows with a well-balanced ration, all raised on the farm. Until recently it has been thought that we could not grow alfalfa successfully. But it has now been found that with proper care and management in getting it started it can be grown anywhere that corn and clover will do well, if the permanent water line in the ground is not too near the surface. Water should be down three or four feet at least. I would advise every farmer to try at least a small piece of alfalfa next spring. Put it in a place where it will not interfere with the regular rotation of crops, for alfalfa, if one gets a good stand, can be left for many years and produce better three years after seeding than it will the second year.

The ground should be rich and well prepared, and the sowing done as early in the spring as it will do to work the land. Sow thirty pounds of good seed to the acre and sow it by itself—without any "nurse crop." Some weeds will, of course, grow up with the alfalfa. These should be clipped off with a mower in July. If there is only a light growth, it would be as well to leave it on the ground as a mulch. But if there is too large a growth to leave on the ground then it can be raked up and taken all for hay. There will be a great deal of alfalfa with the weeds, and stock can pick it over and get a great deal of good out of it.

I know of several pieces in Jefferson county, Wisconsin, that were treated in just this way, and the first of September they were again mowed and produced at this cutting fully 1½ tons to the acre of as fine alfalfa hay as I ever saw.

Alfalfa, after it gets a good set, can be cut three or four times a year. A year ago last summer, that fearfully dry season, I know of some that was cut four times, and the four cuttings yielded six tons to the acre.

WOMAN'S WORK IN THE POULTRY YARD.

Hatching chickens either under a hen or in an incubator, is easy work in comparison to rearing them.

After the chicks are hatched I leave them for twenty-four hours in the incubator, some people advocate their being kept there without food or water for seventy-two hours, in order to allow the yolk of the egg (which is drawn into the chicken through the navel the last day of its life in the egg shell) to assimilate. This yolk stays in the chicken for about three days and if the chicken is chilled or overheated whilst the yolk is still undigested the yolk hardens, toughens like rubber, bowel trouble or blood poisoning comes and the chick dies between the third and the tenth day. The same trouble occurs, the hardening of the yolk, if the egg is chilled, or overheated the last few days in the incubator. A very clever surgeon, a friend of mine, cut some chicks open, took out the rubberlike egg, sewed them up and the chicks recovered.

When chicks are about twenty-four hours old I take them from the incubator, placing them in a basket well lined with flannel and covered with a flannel cloth to keep them warm during the short trip to the brooder. Many chicks take cold and lose their lives from being chilled on this journey.

The brooder should be warmed for at least six hours before this and heated to a temperature of 95 degrees. The floor covered with coarse sand. The first day the chicks should have nothing but sand to eat, then I scatter rolled breakfast oats on the sand, the white flakes instantly attract their attention and they pick them up—I also give them a fountain of water, and one of skimmed sweet milk, and it is surprising to see how quickly they will learn to eat and drink. In the evening I look in upon them, and am pleased when I see them spread over the hover floor; this indicates that they are comfortably warm, and that they will not crowd or huddle during the night. The first thing in the morning I give them some more rolled oats and chick feed. The chick feed I buy at the poultry supply stores; it is composed of a great variety of grains, with a little grit, dried blood and charcoal mixed in. This is their main food until they are eight or ten weeks of age. I feed them five times a day. When they are two weeks old they have a change for supper. I give them a feed of hard-boiled eggs, bread crumbs and onion, chopped fine, such as I feed the turkeys, or I vary this by giving them Johnny cake, or a crumbly mash of two parts bran and one part corn meal scalded. This is their last meal in the day, and I give them all they can eat, sending them to bed with their little crops full. I keep a thermometer under the hover in the brooder and lower it one degree a day till it is down to 65 degrees. After they are six weeks old, except in the coldest weather, they require no heat.

I give the little chicks plenty of green food, usually lettuce, at least twice a day, alternating it with the chick food; they very early learn to tear the lettuce to pieces if hung up on a string. I give them fresh water each time they are fed, the first feed is at 6 or 6:30 a. m., and if I fear that I may be later than that I put fresh feed and water in their run over night, so that the hungry babies may not be kept waiting. They come out at day break, eat a little, and sometimes drink, and then go back and take another nap.

The brooders must be cleaned twice a week the first week, three times a week afterwards and everey day when the chicks grow larger.

There should not be more than fifty chicks in a brooder, and twenty-five is a better number; they will grow faster and be much stronger if they have plenty of room. For the first four or five days I keep them in the brooder house, after that I let them out on the ground. I keep their little yards well spaded up and plant barley or wheat in them several times during the season, so they will have something to scratch for, and when the yards are not in use I keep crops growing in them to renew and freshen the soil.

When I want to keep the chicks for breeders I feed them dry food, dry chick feed and rolled oats; or if I do not have chick feed I mix equal parts of wheat, cracked corn, rolled oats and Kaffir corn, feed it dry, and give them only one soft feed a day, and that at night. But when I want to force them for broilers, I give then three times a day the following mash after they are five or six weeks old—one part bran, one part rolled oats, one part corn meal mixed with skim milk to a crumbly mash. I add a little pepper, salt and charcoal to this besides leaving charcoal and grit always before them. I feed them of this mash what they will eat up in 20 minutes, removing any that is left at that time; the object is to keep them a little hungry; if they do not seem hungry at the next meal I skip one meal and they will be eager for their feed when next I come round. The chicks should be dusted with insect powder about once a week. To do this I have a tin box (baking powder can) with a perforated cover—put insect powder into it, and after dark raise the hover and sprinkle powder over the chicks; this will usually keep them free from lice, but should the lice once get in, the chicks will have to be greased on their heads and on their throats, just under their chin.

With this system of feeding and the close attention I give my chickens, they will average 2 lbs. in weight at two months, and will gain at least one pound or more each month, making fine roasters at four or five months.

* * *

ANSWERS TO QUESTIONS.

Mrs. Basley: Through the columns of the Cultivator, will you tell me what to feed my Plymouth Rock pullets, now six months old, to force them to lay? Also the quantity for ten pullets? These questions are vexatious ones to me. My fowls have access to plenty of green alfalfa—does that fill the bill in regard to green food?—Mrs. Eva Reardon, Santa Ana, Cal.

I never force a pullet to lay, as I prefer them to develop large healthy frames, and, properly cared for, they will lay at six months, if they are in good health, without forcing. "Lee's Egg Maker" is the best egg maker I know of; directions on each package. A hen of the American breed requires about six ounces of food per day, that is weighed dry. Green alfalfa "fills the bill" in regard to green food if they have all they require.

A sandy, dry soil is best for poultry, as such soils, if very porous, will be cleaned by the rains carrying down the filth into the soil, and because there is less mud and dampness in winter, says P. H. Jacobs. Nearly all of the large duck farms are on sandy soil, and as the use of such soil for the raising of poultry is profitable, there should be an opportunity for those who have farms composed of light soil that cannot be made to pay otherwise, to devote themselves to poultry, especially if near markets that can be conveniently reached.

Chickens need a dry, airy place in which to live, and plenty of exercise to keep them healthy, as much as you do. See that they have it, if you want to keep them healthy and free from disease.

SHOEMAKER'S BOOK ON POULTRY

and ALMANAC for 1904

There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of Thoroughbred Fowls, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about INCUBATORS and BROODERS. It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address

DOCTORING POULTRY.

The average poultryman should be very careful of the medicine with which he doses his flock, as sometimes the medicine is as bad as the disease. The cheapest and best medicine we have been able to get is ordinary plastering lime; it sells for $1 per barrel in our town, and a little of it goes a long way and does lots of good while it is going. I have not had any cholera on my place for six years, and I attribute the general good health of my fowls to a liberal use of lime. Some of the good uses I have found for it are as follows:

When I see signs of soiled feathers I throw a little lime in their drinking water, it seems to be a good regulator.

It is a good disinfectant, and after cleaning the dropping board, throw a handful down; it is wonderful how lime will kill all bad odors.

Use lime mixed in the dust box, the lice won't loaf around there much. I notice they won't make many steps in lime until their relations send for the undertaker.

When one of your hens gets ready to take the regulation three weeks lay off, throw some lime in each corner of her nest. Some lime thrown down around outbuildings will dry up the wet places.

When your hens are laying soft shell eggs throw lime where they can get it. I have seen lime water stop a threatened case of cholera in good shape.

Lime dust is sure death to all garden bugs, and nearly all preparations for fruit spraying purposes contain lime, in fact, lime will serve the purpose wherever you put it, and it works while you sleep.

Horses, hogs and cattle are also benefited sometimes by a little lime sprinkled in their feed or water. For wire cuts and running sores on animals, air slacked lime is like a hard boiled egg—hard to beat.

After you have whitewashed your hennery then mix some lime with sand and when set, break it up. Old mortar is a great appetizer for chickens. I fed my hens some and while they were picking at it my neighbor's hens looked through the fence and I could almost hear them grit their teeth with envy. So buy you a barrel of lime and every two or three days throw some in each corner of the henhouse. The membership is open to the lime kiln club and when you wear out a whitewash brush, buy another and some day your chickens will raise up and call you blessed.—Brice Haynes in Poultry Success.

HEALTH IN FOWLS.

The general surroundings are what you want to look after to make the poultry business a success. One ounce of prevention is worth many pounds of cure. We all know that the sound, active, vigorous and healthy fowl is seldom attacked by disease. Until the less hardy fowls of the flock have gone under, a sound constitution is the best safeguard against disease. The preparation for physical soundness must begin with the grand parents.

Breed for health just as carefully, or more so, than for fancy, or practical points. Never allow an ailing fowl, or one that has had serious illness in your breeding yards. Breed only birds of sound and healthy parents. When you get healthy birds, keep them so. Use lots of air-slacked lime about your poultry quarters. Use common sense methods in caring for your birds. Don't crowd them in a tight, close coop. Give them plenty of ventilation from the top. In the fall thousands of ordinarily healthy fowls develop colds and start on the road to roup and death through the lack of common sense on the part of their owners who shut them up so tightly at night in a close crowded house or coop. Birds that have been accustomed to plenty of air at night in open front roosting coops are almost certain to come to grief if shut in too close at night in the early fall.

The drinking water is a fruitful source of disease. Germs are easily conveyed from one fowl to another. Drinking dishes must be kept clean and be refilled with pure fresh water. Earthen ware water dishes are cheap and are very easy to keep clean. Avoid dampness, unclean quarters with an accumulation of foul droppings.

Keep your poultry quarters clean and dry. Keep crushed bone and oyster shells where the chickens can get them. They must have some kind of grit to grind their food. Oyster shells is the best grit to get for poultry. Crushed bone is fine for young growing chickens.—Jesse Latshaw in Northwest Horticulturist.

Like milk, an egg is complete food, says Farm and Fireside. If fed on eggs alone, young animals are furnished with all the necessary elements for the growing of bone, muscle and all that goes to make a perfect animal of its kind. A hen can possibly lay 200 eggs in a year, but ought certainly to produce 120. Eight eggs will weigh a pound.

Entirely too many do not consider how necessary it is to give continual vigilance to poultry culture if they wish to be successful. This is the cost that must be put into the business or failure is sure to follow your endeavor to raise poultry without it.

Take time to watch the lamp flame so as to be able to judge how large it should be when the temperature is about right. Then you can set it so the heat will not become too great or not enough, within a few degrees. The regulator will do the rest.—Farm and Ranch.

If your chicks are suffering with bowel trouble, it is an indication of lack of warmth. Attend to the matter or you will lose your chicks.

If eggs become rotten it is absolute proof that they were fertilized, that the germ of life started and then died.

The more nearly the roosting house comes to being actually clean, the less will be the liability to disease among the chickens.—Fancier.

As a rule a hen that has proved to be a good layer and mother this year will prove more so next season.

The man who cannot make a dozen hens pay a fair profit will rarely succeed with a larger number.

If the hens have stopped laying, an entire change of food will often start them laying again.

If the hen gets too fat, one of the best remedies is plenty of exercise, and the more active the fowl the less danger on this score.

The Cultivator, a few weeks ago, made mention of a prolific hen owned by Wm. Posthill near Livermore, that laid sixty-three eggs in forty-four days. The truthfulness of the statement was questioned. Now Mr. Posthill offers to make an affidavit that the statement is correct. He says the record began June 4th and ended July 29th. The hen is a plymouth Rock—is a pet and kept separate from the other fowls.

When writing to Advertisers Please mention Cultivator

Protection From Frost.

(Continued from first page)

his own orchard was due to the fact that it had not been frosted. At any rate it was an argument in favor of the value of oil pots.

As to the relation of wind-breaks to frost, there is again some diversity of opinion; but I think that the concurrent view may be summed up in the words of Mr. Koethen, of Riverside, that if at right angles to the flow of cold air, a wind-break is injurious to the ranch above; otherwise beneficial. Mr. Hofman, of Cucamonga, made some interesting observations in this use of a set of self-registering thermometers he established the fact that on a clear cold night, when no firing was done, the temperature at the foot of his grove immediately north of a wind-break, was 6 deg. lower than at the upper side of his orchard, just south of a wind-break. On the nights when he fired, the temperature was the same at the two points, showing apparently that the retention of the smoke and heated air fully overcame the damming up of the cold air.

My own observation is that an east and west line protects the trees for a distance of not more than ten or twelve rows (200-250 feet) to the south, and as far to the north as the shade of the wind-break extends. A north and south line will protect trees to west for the distance it casts its shade.

My own experience with frost during the season was not a satisfactory one. I used oil pots, one to each two trees, or 54 to the acre. The conditions during the day preceding the severe cold were such as to lead me to expect a very low temperature; a light rain had fallen, and the snow lay low on the foot hills. My elevation of something like 1800 feet brought the snow very near me. A heavy north wind had been blowing down the Cajon Pass and over the country east of my place all day. At sunset the mercury was below 40 deg. Under such conditions a severe freeze may be foretold with certainty. There was just one chance of escape, and that was that the north wind would continue to blow and extend far enough to include my place in its path. It did blow all night to the east of me and to this fact undoubtedly a large section of country owes its escape from a killing freeze, and in those sections where it blew only at intervals, and where firing was resorted to, their more fortunate escape is due probably as much to the occasional gusts of wind than to the oil pots. At my own place I think not a leaf stirred during the night. The mercury was below 32 deg. at 9 o'clock, and at 27 deg before 11. At this stage I lighted the fires. It should have been done sooner, but I saw that the oil in the pots would burn out before morning. As it was, I found it necessary to replenish the pots. When the fires were lighted the heat from them brought the temperature up one or two degrees, but the increasing cold forced it down again, and it went to 27, 26, 25 deg. and for an hour or two stood at 24 deg. Thermometers on adjacent places where there were no fires, marked 22 deg. The lemons were practically all destroyed and young growth on the trees killed. Apparently the oil pots had done me no good. However, succeeding days showed that my trees were injured less than in orchards where there had been no fires, and today, after having removed a small amount of dead brush, my trees are thrifty, and show no signs of the frost. They have set, however, very little fruit. I saved the trees, but that is not enough; I do not care to grow trees unless they bear fruit.

In the light of present knowledge may we hope to protect our fruit against the cold? The testimony is undoubtedly to the effect that we can do so. The experience of W. S. Palmer of Upland is valuable. In a small, isolated lemon grove, by the use of one basket to each tree, on a night when the mercury was as low as 22 deg. for several hours, he saved 90 to 98 per cent. of his grown lemons. The careful experiments of the Riverside growers and their success in protecting their orange crops, warrants the conclusion that effective measures may be taken. The testimony of Mr. Teague, of the Limoneira ranch is especially favorable. In reply to the question "Can we, in your judgment, by using protectives against frost, successfully grow lemons in places where the temperature at times of severe cold reaches 22 deg.?" he says: "We have been doing so for the past three years." The strongest testimony that I can give for the efficacy of frost protection was our experience of last year. We have 1000 baskets on the Limoneira ranch, running up a little above the cold line which was established during the cold winter of four years ago, above that point we have no coal baskets, and, after the freeze of last winter practically the only damage we received was on the land above the coal baskets, and there was a distinct line clear across the ranch, there being much less damage on the coldest land which we have than on the higher land which has heretofore been free from frost." It is to be noted that the most satisfactory results have been attained where the work was done on a large scale, as in the case of Mr. Teague, with his 10,000 baskets, or in a compactly settled place like Riverside, where, although it may be that not all of the growers fire, still the number of fires is great. I am convinced that the small grower with an isolated grove can not secure such results, or indeed satisfactory results at all, without the use of a large number of baskets per acre, not less than 100 per acre, or it may even be, as one of my neighbors suggested during the cold of last winter, that we needed four oil pots to each tree, one for each side, north, south, east and west.

At any rate we cannot afford to quit fighting. I believe it was Joe Manley, of Maine, who remarked, "God Almighty hates a quitter," and there is too much at stake. It goes without saying that a grove that is thrifty and vigorous will stand the cold better than one that is enfeebled by lack of water, fertilization or cultivation during preceding summers. The more nearly dormant the tree is the greater its chance of safety. A lemon tree should not be pruned late in the season, for the new growth will surely be cut back by the frost, and besides, we need all the branches the tree had to protect the fruit. If a head of irrigating water can be had during the cold night it will be of value.

The lighting of numerous small fires through the orchard is the remedy as yet found most effectual. The benefit derived from them I am sure comes not altogether from the amount of heat they produce, but partly from the movement of the air produced, and largely from the covering of smoke that soon after lighting the fires hangs over the grove, preventing radiation. On account of the far greater ease with which the oil pots may be handled, easily replenished, rapidly lighted even after a rain, and also because of the greater amount of heat and smoke they produce, oil pots would be preferable, were it not for the danger of smutting the fruit. Probably the plan adopted by J. W. Freeman, of Ontario, is a good one, baskets through the grove, with a row of oil pots along the upper side of his orchard. Frank Palmer has used and recommends a bricquette of asphalt, oil and sawdust. The owner of a small, detached grove, whose neighbors are not co-operating, will need to provide liberally, I think not fewer than 100 to the acre, and double the number it is expected to burn should be provided, or arrange made to replenish the fire during the night, and this is hardly practicable. We should be in the position that when freezing water and stiffening leaves indicate the beginning of the freezing process, the fires may be lighted without fear that they will be burned out before morning, when the cold is ordinarily most severe. We can not hope for the greatest good from the fires if the fruit is already damaged when they are lighted. The fires should be burned till 8 o'clock or 9 o'clock in the morning, and should be so managed after daylight as to secure the greatest possible degree of smudge, this, of course, to protect from the early morning rays of the sun. Indeed, I am persuaded that if it were possible to effectually screen the grove on the day following a severe freeze, the damage would be greatly lessened. This leads to the inquiry if such a plan may not be practicable, at least for the lemon growers. With this thought in view, a number of the Ontario growers visited the Everest ranch in Riverside, to study the effect of the lath covering that is over that orange grove. Their observation led them to believe that as a protection against frost it is effectual. Some doubt exists as to the effect of the covering upon trees and fruit. The orchard did not seem to be in the thrifty, vigorous condition that the Riverside groves usually possess, and the fruit, both in quality and quantity, was hardly up to the standard. But with the lemon, the conditions are different. Our best fruit is grown in the shade, and if the tree will not thrive under such covering I believe it may be found possible to remove it during the summer. A gentleman at Upland is now devising a covering similar to that over the Everest groves, but with the covering to consist of light laths, woven with wire, and so arranged that all of it or a portion of it may be readily rolled up, giving the trees free sunlight if needed. As a protection against frost I believe it would be entirely effectual, and at the same time possesses other advantages. If it may be allowed to remain during the summer it would lessen the amount of irrigation and cultivation needed, and during the year the protection it would afford against the wind would largely improve the grade of the fruit. If used in sufficient quantity to justify him in establishing a plant for its manufacture, the gentleman estimates that he can place it over a grove at a cost of $300 to $350 per acre. While the cost is great, it should not be prohibitive. I know growers whose loss by the freeze during the winter was greater. Some of us think enough of the scheme to plan to co-operate in covering a few acres, and test the method.

California Citrus Interests.

(Continued from first page.)

fornia crop. The orchards are much more scattered, and the shipments are to a great extent in small lots, so that no trustworthy figures are obtainable. Enough, however, is known to show that we shall have quite considerable competition from that source. This fruit will be marketed almost entirely between now and the first of March, so that it is for the most part out of the way before the active shipping season begins with us. This Florida fruit has a distinct advantage over us in the great seaboard markets, such as Philadelphia, New York and Boston, and even in the interior as far west as the Mississippi valley, because their freight rate is much less than ours. This side of the Mississippi their rate is about the same as ours. There is every reason to believe that the product of the Florida orchards will increase from year to year so that in the course of a few years they may be expected to produce as much fruit as before the freeze, which was approximately 5,000,000 boxes. The competition from abroad is not of a serious character, so long as we are protected by the existing duty of one cent a pound. Very considerable quantities of oranges come to our shores from Jamaica, but these arrivals are chiefly between September and January, so that they are not seriously in our way. The same is true of limited quantities coming from Cuba and Porto Rico. What the future has in store for us from the islands remains to be seen. If the pending reciprocity treaty with Cuba should be ratified, it will surely give encouragement to growers of citrus fruits on that island, and prove more or less of a menace to California. It is hoped, therefore, that the treaty will fail of ratification, and California should certainly bestir itself to prevent the ratification.

* * *

The Citrus Fruit Industry.—You people, it seems to me, have a proper appreciation of the importance of the citrus fruit industry to this country. It is not extravagant to estimate that the crop now on our trees will bring into Southern California over and above freight charges, $10,000,000.

This is a very conservative estimate. A sum of money of this kind is of vast importance to this region. We shall probably have to calculate on lower prices, and at no distant day upon a lower freight rate. It is hard to say just when we shall be able to prevail upon the carriers on this point, but it must come sooner or later. With a lower level of prices, there must be economy in handling at every point. There must also be the widest possible introduction of our fruits into all markets. The California Fruit Agency, which will probably handle at least eighty-five per cent of the crop now growing, undertakes to reach every market available, not only in this country, but abroad, having established its agency in Europe and also seeking outlets into Australia and Asia. We have forty offices in the cities of the United States east of the mountains engaged entirely in the marketing of California citrus fruits, and it will be our constant study to find new markets, and to create new demands wherever it is possible to do so. While our problem grows more difficult, with the increasing quantity of our oranges, it is correspondingly difficult by reason of the insufficiency of our lemons. If we had more lemons, we should market them to better advantage than we do now. California produces less than one-third of the lemons required in the country, consequently we are continually menaced by importations. We introduce our lemons into the markets and make a place for them, and then are not able to supply sufficient quantities to keep out the foreign product, so we are in a constant struggle with our competition. The California lemons are superior to anything else produced in the world, and are preferred wherever they have been introduced, so that, in my judgment, when our orchards are producing more lemons, we shall find less difficulty in marketing them advantageously.

Withal, I see nothing to indicate that our orchards are not to be continuously profitable, although it is certain to be to some extent a survival of the fittest.

A. H. NAFTZGER.

HOW DOES IT SEEM TO YOU?

It seems to me I'd like to go
Where bells don't ring nor whistles blow,
Nor clocks don't strike, nor gongs don't sound,
And I'd have stillness all around.

Not real stillness, but just the trees'
Low whisperings, or the hum of bees,
Or brooks' faint babbling over stones
In strangely, softly tangled tones.

Or maybe a cricket or katydid,
Or the songs of birds in the hedges hid,
Or just some such sweet sounds as these
To fill a tired heart with ease.

If 'tweren't for the sight and sound and smell,
I'd like a city pretty well,
But when it comes to getting rest
I like the country lots the best.

Sometimes it seems to be I must
Just quit the city's din and dust
And get out where the sky is blue,
And, say, now, how does it seem to you?
—Eugene Field.

Pardoned, or Grip the Miser.

(Original.)

He was known among his acquaintances as "the Miser," or "Johnny Grip," because he loaned money at extortionate rates to the poor and compelled payment to the last farthing under all circumstances.

His home was a dingy office in an extensive old rookery on a prominent street of Philadelphia.

The building was filled with odds and ends of all sorts of humanity except those in the enjoyment of plenty.

The angels, the bright stars, the winter winds and drifting, inquisitive snow, that sifts through open windows, broken walls, rifts, rents, cracks and crannies, to the desolate abode of poverty, knows how poor and Godforsaken man can be and still live.

But the poorest among the miser's tenants had plenty compared with what he gave himself.

What a miserable place that office was! A rollicking drunken old desk, supported on three legs and braced against the wall to make it stand, was surrounded with pigeon-holes from which numerous apertures protruded dusty, dirty old papers, like tongues from the lips of the strangled.

There was a broken chair, a broken stove, a little fuel, and a time-worn old lounge with inside gone; a greasy headrest; two worn blankets and some fragments of old clothes, completed the furniture, excepting only a huge square, rusty antique iron safe, with a very determined appearance, much like the miser himself.

Nothing but "Johnny Grip" and that relentless old safe could dwell in such quarters and hold on to life.

Johnny said to the safe, "I'll get," and the safe said to Johnny, "I'll keep," and for more than fifty years the compact was faithfully kept.

The money that came to that safe was wet with tears and loaded with supplications and curses; but the safe complained not and "Grip" never mentioned it.

What friends they were and how constant and true to each other.

The pale face floating in the river, the disfigured dead of the morgue, the frozen mother and babe of the "attic" bore silent but fearful testimony.

"Ah, well," said Grip, "they must die sometime and its better they kill themselves and get out of their misery."

The world's a ship on short allowance, and the more dead, the more food for the remainder.

But for me they'd died before, but they live to curse me and take to the water later on.

The water way is respectable, no long sickness, and now and then one gets in with his boots on—same as a gentleman.

There's the key to the cause.

Nothing but extravagance.

None of mine are found in boots, especially good whole boots. I let them keep them 'til the last thing, out of mercy, so they can get to the brokers and back without freezing their feet.

Women, 'specially with babies, can't stand the cold ground without something on their feet.

When one of them brings her shoes, I says to the safe, "that's the last of her," and generally there's an inquest a day or two later.

Whiskey sends many a man to water at last, but milk is the ruin of women with babies.

They're just gone on it when they're the nearest starving.

If they'd let go the young one and drink the milk themselves, but they won't. So willful like they goes without bread to get milk for the brat, and both dies and there's the end.

So I say milk's their ruin.

My motto is, where one of two must die, let the other man have the honor.

I've tried many times to advise mothers that way, but what's the use? They fall to crying and go on to the end in their own way.

There was that young creature up stairs, whose husband was killed at the big fire trying to save a poor devil from burning.

There was something in her hair and eyes 'at made me think of other days. 'Specially her hair, which was light.

She was such a little thing, and was sick a good deal.

After the first month she paid me no rent, and I didn't ask her. I didn't need fire, but nights she'd come to the office and shiver and hold onto the babe 'til out of mercy I'd build one, tho' I knew it was wasting money.

Then she'd get over it and hold the baby down close where it could warm, never seeming to think of herself.

At last she got on to the milk racket and I tried to advise her, but it did no good. There was a look came into her eyes and a gray tint to her face and she offered her shawl and I paid her, her own price.

She didn't buy milk though, this time, it was charcoal—she and the baby side by side and the white ashes of the charcoal in an open pan, explained matters to the coroner.

She saw the end of milk, took charcoal, and quit; but milk was the cause for all that.

They say I'm without mercy, have no charity, and call me 'Grip the Miser,' forgetting that mercy costs money and so too does charity; and that the world is full of poor; that if I gave my all, it would go no farther to end the misery than a drop of hot water toward warming the sea.

So I says to the safe, we'll draw the line at the beginning, rather than at the end, for as long as there is human folly, there'll be human woe, and we can't stop it.

I set an example of economy, which if followed by the world, not a pocket in it but would carry the price of food.

I eat crusts and garbage, dress poorly, go without fire, sleep cold, to prevent starvation at the end.

These poor dine on plenty until a rough place is reached and think that the mouthfuls saved by men, one at a time, should be given to them, and if they starve paying me for a loan or go to the river and end it quick, it is said 'Old Grip' sent them there.

I wish sometimes I had helped the little mother with the blue eyes and light hair, even if she got milk for the little one; for she wasn't to blame, like most of them—but—I couldn't bear to take from the safe or have it know I was weak.

I made her warm though when the world left her cold, and I gave her a roof when she was homeless."

* * *

It was a bright spring morning and the air was full of song and the odor of lilacs.

Curious people were passing in and

Dependable Furniture at a Fair Price

WEATHERED OAK

Odd Pieces for Den, Library and Hall

We have an unusual display of Old Mission Furniture in this splendid finish. These pieces were manufactured by Gustav E. Stickley, the originator of the modern mission styles, and they are without question the finest pieces of the kind ever shown here. Every joint is made to fit perfectly and is mortised and pinned in such a way that it can never come loose. Every part of this furniturs, even the handles and nails, are made entirely by hand by the most skilled workmen. We would like you to see this assortment while the line is still intact.

FIRST AND SPRING LOS ANGELES, CAL.

out of that dingy little office.

The writer passed in with others and saw sitting at the old desk the dead body of "Grip the Miser."

A thin old man, poorly clad, sitting there with long gray hair falling about his shoulders was nothing, for I had often seen him in that place, in that same position, day after day, for many years; but sitting there dead was quite another thing.

All cupidity, all cunning, all avarice had passed from the face of "Grip", leaving behind simply an aged man frozen in death.

In front of him on that tottering old desk, in the midst of the wretched squalor that seemed multiplied a thousand fold by the presence of the dead, rested a jeweled golden casket so artistic in design, so rich in setting that it seemed rather the thing of a dream than an actual fact.

Besides the velvet lining there was at the bottom the softest down, on which rested a worn, soiled old letter, whose faded writing was in a girlish hand, and bore date fifty-two years before that very day.

It was addressed to James Gripp, Esq., and commenced with "Darling Jamie," and referred to a preceding Sunday when they were in the forest gathering wood violets, and of his kindness to her mother in the time of her trouble, for which she prayed blessings on his dear head; and the eagerness which she was waiting the near approach of their own marriage; of friends, naming them, that would be there; with expressions of love and loyalty to her "Darling Jamie," etc., etc., ending with your wife that is to be, your own Jennie.

In the old man's hand, twining about his fingers, was a long flaxen curl and on the lashes of his half open eyes were tears not yet fallen away.

Who, from these evidences, could not read the pathetic story of a perverted life, knows not the quality of the human heart.

As I stood there the mists and shadows of fifty-two years passed away, and I saw green fields bright in the golden sun and verdant forests melodious with the songs of wild birds.

The Hyancinths and Jonquils were in bloom and the perfume of flowers and odors of spring permeated the air.

Farm houses, blooming orchards, meadows and winding streams filled the landscape.

Within the forest was a radiant maiden with eyes blue as the sky, hair yellow as the golden sun, cheeks and lips rosy, her form robed in white, with wood violets pinned at her throat.

Another figure was there, that of a youth with beardless cheek, swarthy from the sun; a bright eye, firm chin, and a face full of generous impulses.

Love light filled their eyes and with hand clasped they talked of their love; of the beckoning future, wherein they built home and all things they hoped for.

They saw countless springtimes come and go, and so too the golden harvest ever bringing them the sheaves of plenty, and side by side thro' the rolling years they saw themselves toiling and loving thro' sunshine and shadow until lost in the misty horizon of that far away future they could dream no farther.

Then I saw a pallid form with waxen hands folded over a still heart, with eyelids resting upon frozen cheeks and yellow hair that curled over a smooth white brow, wherein dreams and hopes alike were silent forever.

Death breathed but once on rosy cheeks and that radiant form was gleaming marble.

Then an abyss of yawning blackness between the dead then, and the dead now, wherein that youth was plunged, and through which cold and hungry, he struggled, seeing nothing but misery, until his heart hardened against the pleadings of sympathy, and he grew morose and cynical, and the tears dried in his heart and charity faded from his soul until at last, when the years had bleached his hair to silver and shriveled his flesh and plowed and furrowed his cheeks like corrugated parchment; with no fire to warm his blood and rags only, to keep out the chill. Death smote him hard and quick and the miser was no more.

But through all that black abyss, that awful night between death and death, thro' mire of avarice and the slough of greed, tearing food from his mouth to make it turn to coin, freezing his flesh to give gold to the safe, he wore upon his breast the gleaming star of love, and around it he built walls of gold, glistening with precious stones, and amid silken canopies on a bed of down, a school girl's scrawl and a lock of golden hair formed the altar whereat "Johnny" Gripp in life and in death ever came to worship.

Reading this we pushed the gray hair back from the stiffened face and brushed the tears from the sightless eyes, and gently, oh so gently, laid him back; his pallid hands upon his breast with that lock of hair in loving tenderness twining among the bony fingers. And on the tablet of memory, written under the name of "Grip the Miser" finds the words—"Pardoned", because he loved.—Carra De Puy Henley.

Recipes...

Children's Sponge Cake.—Three large eggs, beat one three minutes; add cupful and a half of sugar and beat five minutes; add two tablespoonfuls of cold water, one teaspoonful vanilla, a pinch of salt, and one cupful and a quarter of flour, measured before sifting and one rounding teaspoonful baking powder. Beat all thoroughly before placing in pan. The proportion of flour will vary a little according to the size of the eggs. Bake in a moderate oven.

Green Grape Jelly.—The wild or fox grapes are to be used for this. Gather them before they are fully ripe, stem them, and heat slowly in the preserving kettle, stirring and mashing thoroughly; place a large piece of cheese cloth in a sieve, on the top of a large bowl. Let this drip for an hour, then remove and pour off the clear part of the juice. To every pint of this add a pint of sugar, boiling for twenty minutes and skimming often. Very nice with cold meats.

Grape Juice Tonic.—Wash the grapes and pick from the stems. Weigh them, and to every five pounds add one quart of water. Cook in a porcelain kettle, and, when soft, strain through a fine sieve. Return to the kettle, adding two pounds of sugar. Let it boil up once, skimming if necessary, then can at once.

Frosted Grapes.—Choose sound, perfect fruit, wash and drain it. Dissolve a very little gum arabic in warm water and add to it the beaten whites of eggs, of which there must be sufficient for the quantity of grapes you wish to frost. Dip them in this, then roll them in fine granulated or powdered sugar. If the grapes become damp, dust them again with sugar just before serving.

Baked Green Peppers.—Scrape out the seeds and stew the peppers gently in salted water until tender. Drain them and fill with a mixture of bread crumbs and the outer portions of tomatoes coarsely chopped, about two-thirds crumbs and one-third tomatoes, seasoned with onions, butter, pepper and salt, and just moistened with beaten egg. Put into a pan with a little soup stock, and bake slowly half an hour, basting often.

Cranberry Tapioca.—Soak a cupful of tapioca in cold water over night and next morning cook it in a quart of boiling water until it is a clear thick jelly. Then add a quart of cranberries, stewed soft with two cups of sugar and rubbed through a coarse sieve. Turn into a mold and serve when very cold with whipped cream.

Cranberry Charlottes.—Line small molds with very thin slices of white cake; fill the molds with cranberry jam or jelly and set in a cold place. Turn out to serve and heap whipped cream over them.

Cranberryade.—Take two-thirds of a pint of washed and selected berries, and one cup of cold water and mash the berries to a pulp. Cook a large teaspoonful of oatmeal in two quarts of water, adding a slice of lemon; when thoroughly cooked strain, add the cranberries and sweeten to taste. Boil again half an hour and strain.

Cranberry Filling for Cake.—A rich cranberry jelly makes a nice filling for a white layer cake. The icing used may be colored a delicate pink with a little of the juice.

A WOMAN'S HOUR.

"Please state to the court exactly what you did between 7 and 9 o'clock on Wednesday morning," said a lawyer to a delicate-looking little woman on the witness stand.

"Well," she said, after a moment's reflection, "I washed my two children and got them ready for school, and sewed a button on Johnny's coat, and mended a rent in Nellie's dress. Then I tidied up my sitting-room and watered my house-plants and glanced over the morning paper. Then I dusted my parlor and set things to rights in it, and washed the lamp chimney and combed my baby's hair and sewed a button on one of her little shoes and then I swept out the front entry, and brushed and put away the children's Sunday clothes and wrote a note to Johnny's teacher asking her to excuse him for not being at school on Friday. Then I fed my canary bird and gave the groceryman an order, and swept off the back porch, and then I sat down and rested a few minutes before the clock struck 9. That's all.

The Rural Home...

Nature is a master artist that blends tones perfectly, how rarely does mankind consider her balanced color scheme, when he intrudes upon the restful harmony which buildings painted in colors that are at strife with the surroundings.

The coloring of the house is important—if on a small suburban lot, white or light yellow is attractive and fits in with the formal garden, planted as a matter of show. The house of the artist, Mr. Delongpre at Hollywood is an excellent example of color and of the refinement that a house receives when it is set as the principal ornament with the flowers, lawns and trees subordinate and used as a color frame. the ivy geranium in pink and the purple heliotrope frame this cream tinted house, while the lace like stucco of the window and door cornices suggest the delicacy of the outlines of the tree tops against the sky.

Now, in the rural ranch house we have the reverse of this picture, the garden is the jewel and the house is the accident, therefore, the buildings are painted a subdued color to tone in and not contrast with the garden it is more harmonious, cover it with vines —making it a hill of green. Few roses of the everblooming type do well when trained against the house, the Lamathae, Banksias, and the prairie roses are good in this position but are only annual bloomers, the wisterias in lavender, purple, white and pink are desirable but should be carefully pruned in July and the rampant growth kept well in hand or the outside growth will choke the inside stem. Honeysuckle and clematis are uncertain, sometimes doing well for years, and then dying without the cause being apparent.

Carrying out the idea that the ranch house is part of the garden, fill the steps and edges of the piazza with plants growing in jardiniers. The eastern florists sends out cheap collections of plants that affords a world of pleasure to watch them grow and next year they can be planted out in the garden and a new series take their place. The seedling palms that spring up along the roadsides, will fill some pots to stand on the steps and in very hot places, these only costing the labor of digging. When pruning, plant a lot of cuttings and when you see some woman struggling to make a garden take her thirty or forty of the little plants, you will enjoy the beauty of the bloom as you drive by her home.

The ranch garden is to be viewed from the house, not from the road, therefore the vistas should lead from the house not to it. Then the views from the upstairs windows are to be considered, for illness will come, and it is hope inspiring to look from the weariness of a sick room into the varied green and forms of the growth of shrubs and palms. The Japanese have caught the idea of the beauty of tree form, when seen from above, but instead of lifting themselves above the garden, they in their topsy-turvy way have dwarfed the oaks and pines and made their gardens so that when standing or walking on the paths, they look down on trees and miniature shrubs, and have as they call it "the vision of the butterfly."

* * *

Birds are the garden's greatest adornment, and if plenty of honeysuckle and a few eastern grape vines are twined on the fences, with some mulberry trees, the birds will love their home and remain by the year. If the grounds are at all large, a fountain or lakelet, planted with water lilies and papyrus on the borders, with a seat near by to watch the goldfish come for cracker crumbs, even the great green frog that startles with his sudden spring into the water, become your friends. The birds love the fountain and will stop to drink and bathe, a sharp call and mother quail runs quickly forward with the little ones following, while the old quail perches on a nearby shrub for a lookout, while the family bathe, sometimes the mocking birds think it is their turn and drop down, scolding shrilly, driving away the quail with their clatter. The humming bird balances himself on the wing, catches a drop of water from the top of the fountain and darts away like a gleaming jewel. The orioles and canaries flit around like bits of sunshine, while the voice of the gentle dove mourns all day long.

"Women and flowers are fit companions.
No marvel women should love flowers, they bear,
So much of fanciful similitude,
To her own history: like herself repaying
With such sweet interest all the cherishing
That calls their beauty, and their sweetness forth,
And like her, too, dying beneath neglect."

* * *

Life in the country loses its best, when it apes city life, the country woman drops this simplicity robs her guests of the charm of her home. Invite superior people to the home and give them the wholesome country food, neatly served. Do not try to give them the elaborate dinners that require a corps of trained servants to have at perfection, but give them what you have and serve as you are accustomed to have it every day. The guests at ease will unfold their best thoughts. Why? Because you are sincere. You are true metal, and if it is only a penny it is not gilded to pass for gold. The influence of genuineness on the children cannot be overestimated. The young daughters of the house hold! From whence will come their ideal of womanhood if the mother of the household has not the courage to be true to the instincts of home making, of making it a house of peace, instead of one of worry where guests are a bane, instead of a blessing.

If the mother is not the ideal of her daughters they may turn to a fashion book for an ideal of life, perhaps to that one that has essays of a hundred words in length, on topics that reverence would place next to the Bible, on pages next to cooking receipts and fashion plates. Woe to the family if the daughters study the foolish lessons of etiquette set to rule in this class of literature, as though good breeding ever came by rote, and not by the culture of the soul. What matter is it if a sweet girl blushingly makes a little mistake compared to the loss of kindliness of heart by taking up the callousness of believing only in self, and in the greed for pleasure, that is plainly apparent in the fashionable girl. The boys, too, must be protected from the false thought that the fast reckless set of the neighborhood is the best, because they spend the most money. Instead, let the guests of the home be an inspiration to show the children that life and its opportunities are far from anything that money can buy, and must come from the cultivation of themselves.

The leisure for culture today is found in the country, for there only is time for books and for reflection.

In the garden the thoughts that flit through the mind soon drive away the cares of life and like all hand work gardening is a panacea for nerves and the blues. Broad views of life sweep away the little cobwebs of self and the universal brotherhood of man is known to be real. Tolstoi and his followers have found the life beautiful to be in laboring with the hands out in the weather, be it fair or foul.

Historically speaking, the dignity and God given strength gained by working has been shown by the contrast between the results of the Christian life in effectiveness and that of Buddah's followers. His converts were to live in contemplation of their own benefit, while the Christian worked for his fellow man.

So a life of the truest culture is easiest led when we are close to nature among the flowers and birds, in the midst of the green vineyards and fields, for here honor and God are real.

In the rural home books should be everywhere, and the home circle being narrow, the children are the companions of their father and mother. Instead of a lot of irresponsible boys and girls dominating society, the family circle is the social life, with father and mother the center, and there is found the true home for making the boys into honorable men and the girls into gentlewomen.

"Give me the house where kindness seeks
To make that sweet which seemeth small;
Where fondness speaks,
And every mind hath care for all."
—Mrs. M. E. Sherman.

MIDLAND POULTRY FEED

Will make your fowls moult in one-half the time, which means they will lay that much sooner. "Laying fowls are paying fowls." You will not be disappointed at the results you get from feeding Midland Feed.

No. 4, Egg and Feather Producing Food

Is what you should feed your hens now, and the results you get will surprise you, for we know it will prove a paying investment. Our book, "The Science of Poultry Feeding," will tell you more about this feed. Send for it. It is FREE. Also

No. 1, Nursery Chick Food
No. 2, Growing Chick Food

We will be pleased to give you further information about this feed if you wish it. WRITE FOR PRICES.

The Only Reliable Balanced Ration for Poultry in the World.

These special foods are composed of the very best materials obtainable and as carefully and accurately mixed as it is possible to make them. They are a COMPLETE FOOD and will produce specific results, each for its purpose, and no other. We want you to become an established customer of ours. We want your trade, be it little or much. There is only one way we can secure it and that is by sending you material that will do what we claim for it.

The Midland Feed will cost you very little more than any good grain you now feed, and no more than you now expend for all the extras you must use in addition to your grain, and the results will be so far in excess of any previous experience you have had that you will readily acknowledge its value.

What the poultry man must be able to count on to a certainty is RESULTS.

SUMMONS.

No. 42415. Dept. No. 5.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Chas. B. Estill, plaintiff, vs. Mollie Estill, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the clerk of said Superior Court.

The People of the State of California send greeting to:

Mollie Estill, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for any other relief demanded in the complaint.

Given under my hand and the seal of the Superior Court of the county of Los Angeles, State of California, this 19th day of Sept., A. D. 1903.

(Seal) C. G. KEYES, Clerk.

By C. O. Winters, Deputy Clerk.

SUMMONS.

No. 42367. Dept. No. 2.

In the Superior Court of the State of California, in and for the county of Los Angeles.

Doty T. Parks plaintiff, vs. Alice Parks, defendant.

Action brought in the Superior Court of the State of California, in and for the county of Los Angeles, and the complaint filed in said county of Los Angeles, in the office of the Clerk of said Superior Court.

The People of the State of California send greeting to: Alice Parks, defendant.

You are hereby directed to appear and answer the complaint in an action entitled as above, brought against you in the Superior Court of the county of Los Angeles, State of California, within ten days after the service on you of this summons—if served within this county; or within thirty days if served elsewhere.

And you are hereby notified that unless you appear and answer as above required, the said plaintiff will take judgment for any money or damages demanded in the complaint, as arising upon contract, or he will apply to the Court for the relief demanded in the complaint.

Los Angeles Markets.

LOS ANGELES, Nov 5.

The local butter market was ruffled slightly the first of the week by cut-rate grocers making a lower price than market, but B. of T. creamery has been held firm at 70 cents per roll. The assertion is made that it will remain at present quotations.

Dried fruit market is firm with practically all peaches out of first hands. There are 75 cars of dried 'cots yet unsold, with as many or more of prunes.

Walnuts are still stronger. Berries are getting to the point where they are luxuries.

Fancy ranch eggs remain scarce and rule active at the same quotations.

Brown Australian onions are in market, and prove a sharp competitor of Danvers, being good keepers, and while not so large are more hardy.

Salinas potatoes of the fancy kinds are not over plentiful. Demand is active. Sweet potatoes are slow, with crop large and prices steady.

Fish in large supply and market nominally active.

Poultry in light receipt, the demand taking all offered.

Cheese is steady; beans about steady; honey slow; dried figs being placed. No other changes of note.

Increased activity marked the early days of the week at the citrus market auction points. The highest range was reached on Saturday, the 31st, when ten car loads of Valencia oranges sold readily at prices which topped the market for the season. In short the season's record was broken. Chapman's Old Missions almost equaled some of last year's high prices. Four carloads grossed $[illegible].66, $1870, $1917.60 and $1932.35 each. Top price were $8 and $9 per box. The trade was greatly interested and expect prices higher still.

The entire week has been signalized by high prices, which are extremely satisfactory to sellers. Choice fruit is not over abundant and sellers expect firm prices for some time to come.

San Francisco Markets.

Dairy.

San Francisco, November 5.

Butter is somewhat firmer than last week, excepting as to the cheaper grades and cold storage. The cheap lines have been dragging somewhat and the willingness on the part of the holders to accept shaded prices has been plain. Fresh creamery has been picked up immediately on receipt.

BUTTER—Per lb:

Creamery, extras	30 @31
Creamery, good to fancy	26 @29
Dairy extras	24 @25
Dairy choice	22 @23
Store	18 @20
California storage	24 @27
Eastern Creamery	23 @25

CHEESE—Per lb:

Cal. Creamery, mild new, extra	14 @15
Cal. Creamery, mild new, choice	13½@14
Young America	14 @15½
Eastern, New York Cream	14½@16

Eggs and Poultry.

As will be noted, eggs have taken a decided slump during the week and are more nearly at normal rates. At present the quotations given are maximum excepting in some cases where extra large whites have commanded slightly above quotation.

EGGS—Per doz:

Ranch, selected large	42½@44
Ranch, good to choice	40 @42
California storage	28 @33
Eastern	25 @30

Quotations on poultry remain practically the same as last week, though there is more spirited demand with possibly better quality. Fine fat hens were particularly looked for and met with immediate sale at top quotations. Four cars of eastern poultry were received during the week.

POULTRY—Old Roosters, per doz, $4.50@5; young Roosters, $4.50@5; Fryers, $3.50@4.50; Broilers, large, $$3.25@3.50; small, $2.75@3;Hens, small, $4.50@5.50; large, $5.50@6.50; Ducks, per doz., old, $4.50@5; young, $$5@6, Turkeys, young, per lb., 18@20c; old, 14@16; Geese, pr pair, $1.75@2; Goslings, $2@2.25; Pigeons, per doz., old, $1@1.25; Squabs, $2@2.25.

Fruits and Vegetables.

There has been a material shading in price of many fruits this week. The shipping demand seems very light. Fine stock in small packages commanded top prices or even above quotations. Berries are stronger with heavy increase of prices. A few raspbefries are in, in small boxes and quickly taken at quoted prices.

APPLES—Per box, common to choice, 25@85c; fancy, $1@1.25.

PEARS—Per box: Winter Nellis, 75c@1.25; other varieties, per box, 35@75c.

PLUMS—Late Red, per box, 50@65c.

FIGS—Per box, 75@$1.

NUTMEG MELONS—Per box, 40@75c.

POMEGRANATES—Per small box, 50@75c; large box, $1.50@2.50.

PERSIMMONS—Per box, 50c@$1.

QUINCES—Per box, 40@65c.

TABLE GRAPES—Per small box, 25@50c; crate, 40@65c; large box, 85c@$1.50, as to variety; Wine Grapes, per ton, $12@20.

BERRIES—Per chest: Strawberries, Longworth, $10@12; Malindas, $2@3.50; other large varities, $4@6, as to quality; Raspberries, $5@6; Huckleberries, per lb, 7@8c; Cranberries, per bbl., Cape Cod, $10@11; Oregon, per box, $2@3.

CITRUS FRUITS—Per box, repacked: Oranges, Navels, nominal; Valencias, $2@2.75; Lemons, $1@3; extra, $3.50; Grape Fruit, $1.50@2.50; Limes, $4@4.50.

The vegetable market remains much the same as last week, excepting possibly in tomatoes, which have advanced; also string beans and Lima beans. These command about ½c per lb more than last week. Tomatoes, though slightly advanced, are not very strong except as to fancy grades. Potatoes are much the same, with fair receipts and prices held steady. Fresh lines of Oregon Burbanks have been marketed in a small way but as a rule $1 is the outside price secured. A few carloads of Sweets have been marketed at regular prices, being quickly picked up.

VEGETABLES—Tomatoes, per box, 15@40c; Green Peppers, per box, Bell, 35@50c; Chile, 25@40c; String Beans, per lb., 1½@2½c; Wax 2@3c; Lima, per lb., 2½@3½c; Green Peas, per lb, 2½@3½c; Egg Plant, per box, 40@60c; Summer Squash, per box, 35@50c; Cucumbers, per box, 40@50c; Garlic, per lb., 3@4c; Okra, per box, 40@65c; Marrowfat Squash, per ton, $10@12.50; Hubbard, $12.50@15.

ONIONS—Yellow, per ctl., 50@85c.

POTATOES—Per ctl: River Burbanks, 50c@75c; River Reds, 50@65c; Salinas Burbanks, $1@1.80; Oregon Burbanks, 75c@$1.05; Sweet Potatoes, $1.35.

Dried Fruits, Nuts, Etc.

The dried fruit market has remained at a standstill during the week, to the extent at least of there being practically no change in quotations. Buyers are in the field seeking small sizes of prunes for export, but they offer only on a 2⅝c basis, and are unable to find any quantity at that price.

DRIED FRUITS.—Prices for carload lots, f.

Apples—Evaporated, 5@6c; Sun Dried, 3½@4c.

Apricots—Royal, fancy, 9½@10c; choice, 8@8½c; Moorparks, choice, 10@12c.

Peaches—Choice, 5¼@6½c; fancy, 8½@9c. peeled, in boxes, nominal.

Pears—Choice, 6½@7c; fancy, 8½@9c.

Plums—Pitted, 5@7c; unpitted, 1@1½c.

Prunes—Four sizes, 60s to 100s, 3@3¼c for Santa Clara; other sections, ¼@½c less.

Nectarines—White, 4@5c; Black, 4@4½c.

RAISINS—Prices by the California Raisin Growers' Association on standard brands, 1903 crop, f. o. b. at common shipping points, are as follows: Imperial Clusters, $3 per 20-lb box; Dehesa Clusters, $2.50; fancy Clusters, $2; Three-Crown London Layers, $1.35; Two-Crown London Layers, $1.25; Muscatels, Four-Crown Standard, loose, 6½c per lb; do, Three-Crown, 5⅝c; do, Two-Crown, 5¼c; Seedless Muscatels, 4¼c; Seedless Muscatels, floated, 4½c; Seedless Standard Sultanas, 4¼c; Thompson Seedless, Standard Sultanas, lencias, Standards, 4¼c; do, Pacifics, 3¾c; Orientals, 2¾c; Malagas, Three-Crown, 5⅝c; do, Two-Crown, 5c.

Seeded Raisins—Prices for limited quantities are as follows: Fancy, 16 oz, per lb, 8c; choice, 7⅝c; fancy, 12 oz, per pkg, 6⅝c.

NUTS—Per lb: California Almonds, hard shells, 5@6c; soft shells, 8@9c; paper shells, 10@11c; Peanuts, Eastern, 6@6½c; California, Walnuts, soft shells, No. 1, 13@14c; do, No. 2, 11@12c; hard shell, No. 1, 12@13c; do, No. 2, 10@11c.

Beans.

BEANS—Prices per ctl: Large Whites, $2.15@2.50; small do, $3@3.20; Pea, $3@3.25; Lima, $2.85@2.90; Red, $2.90@3; PiPnk, $2.15@2.40; Bayo, $2.15@2.40; Blackeyes, $2.15@2.35; Red Kidneys, $4.25.

DRIED PEAS—Green, $2@2.25; Niles, $2.35@2.50.

Live Stock.

CATTLE—No 1 Native Steers, 8@8½c; second quality, 7½@8c; thin Steers, 6½@7c; No. 1 Cows and Heifers, 6½c; second quality, 5½@6c; thin Cows and Heifers, 4@5c; Bulls and Stags, 3@4c. Prices for all descriptions less 50 per cent for shrinkage.

CALVES—Light, per lb., 4½@5c, gross weight; heavy, 4@4½c, gross weight.

SHEEP—Per lb: Fat Wethers, No. 1, 3½c@4c, gross weight; Ewes, No. 1, 3¼@3¾c; gross weight.

LAMBS—Spring Lambs, $2.50@3 per head or 4½@5c per lb, live weight.

HOGS—Per lb: Hard grain fed, weighing alive 130 lbs and over, 5⅝@5½c; weighing under 130 lbs, 5@5¼c; weighing 260 to 350 lbs, 5@5¼c; rough heavy, 4@4½c.

Hay and Feed Stuffs.

HAY—Prices on Hay, per ton: Wheat, $13.50@17; Wheat and Oat, $13@16; Oat, $11.50@$14.50; Barley, $10@13; Clover, $9.50@11.50; Alfalfa, $$9.50@12; Stock, $8.50@10.50.

STRAW—Good to choice, per bale, 55@65c.

FEED CORN MEAL—Choice grades, per ton, $30@31.

GROUND BARLEY—Per ton, $24@25.

MIDDLINGS—Per ton, $26.50@29.

BRAN—Per ton, $22@23.

CRACKED CORN—Choice quality, per ton, $30.50@31.50.

OILCAKE MEAL—In lots of 20 tons, $26 per ton; 10 tons, $26.50; 5 tons, $27; less quantity, $27.50. Prices are mill rates and are subject to change without notice.

BRAN—Per ton, $21@22.

Cereals.

FLOUR—Net cash, Family Extra, $4.60@4.85 per bbl; Bakers' Extra, $4.40@4.60; Oregon and Washington, $3.90@4.40.

WHEAT—No. 1 shipping, per ctl., $1.38¾; choice, $1.41¼; White Milling, good to choice, $1.42½@1.52½.

BARLEY—Choice, No. 1 Feed, $1.13¾@1.16¼; off grades, $1.10@1.12½; Brewing, No. 1, $1.18¾@1.23¾; Chevalier, $1.30@1.45.

RYE—Good to choice, per ctl., $1.25@1.30.

CORN—Good to choice, per ctl: California, new, large Yellow, $1.35@1.40; small, do, nominal; White, $1.35@1.40.

OATS—Good to choice White, $1.25@1.35; Red, $1.22@1.35; Black, nominal at $1.40@$1.65.

Hops.

The price for new crop is 20@22½c, according to quality.

Wool.

Fall clip, per lb: California, Plains, 7@8c; Foothills, 8@10c; Middle Country, 10@12c; San Joaquin Lambs, 8@10c; Northern Free, 11@12c; do, defective, 10@11c; Humboldt and Mendocino, 11@13c; Nevada, 10@13c; Oregon, Valley Spring, 17@18c; Eastern do, 10@14c.

HONEY.

Honey manifests a disposition to slightly shade prices and is now being stored in greater quantity than heretofore. The quotation, while but little if any shaded, some producers are slightly shading on the prices.

HONEY—New comb, per lb:: White, 12@14c; Amber, 10@12c; Extracted Water White, 5½@6c; Light Amber, 5@5½c; Dark Amber, 4½@5c.

BEESWAX—Per lb., 30c.

Eastern Markets.

Grain and Produce.

CHICAGO, Nov. 4.—News in the wheat pit was bearish, English cables being lower, outside markets weak and local receipts increased. There was a disposition throughout the day among local traders to sell December, one of the chief incentives to such action being the decline in the price of that delivery at St. Louis. Opening on December was a shade to ⅛ lower, at 79⅝@79¾, and with liberal offerings and but a small demand the price declined gradually. Reports of damage to the crop in Argentina caused a slight rally toward the noon hour, and the market held quite steady until the last half hour, when a sudden decline occurred on selling by Armour, who has been a heavy seller the past to days. December sold off to 78⅝@78½, and closed at 78½, a loss of 1¼ to 1⅜. Corn ruled firm the greater part of the day, but eased off later. December closed a shade lower at 43¾@43⅞. Oats were weak in sympathy with wheat. December closed a shade lower, at 34⅞@35. Provisions eased off some in sympathy with the decline in price of holdings. January pork closed 2½ lower; lard a shade lower, and ribs were off 1½ to 5 lower.

Cash quotations were as follows: Flour was easier. No. 3 spring wheat, 80½@81½; No. 2 red, 80@81¼; No. 2 corn, 43¾; No. 2 yellow, 44½; No. 2 oats, 34; No. 2 white, 37@37⅜; No. 3 white, 35½@36½; No. 2 rye, 55½; good feeding barley, 37@39; fair to choice malting, 48@51.

Grain Movements.

Articles—	Receipts.	Shipments.
Flour, barrels	50,800	17,400
Wheat, bushels	249,000	38,500
Corn, "	248,200	440,400
Oats,	591,400	381,800
Rye, "	12,200	13,800
Barley, "	269,100	30,000

Chicago Live Stock.

CHICAGO, Nov. 4.—Cattle—Receipts, 20,000, including 6000 Texans; good to prime steers, 5.10@5.70; poor to medium, 3.40@3.46; stockers and feeders, 2.25@4.40; cows, 1.10@4.00; heifers, 2.00@4.85; canners, 1.40@2.40; bulls, 2.00@4.25; calves, 2.00@7.00; Texas fed steers, 3.00@3.75; western steers, 3.25@4.50. Hogs—Receipts, today, 23,000; tomorrow, 18,000; 10c lower; mixed and butchers, 4.75@5.15; good to choice heavy, 4.80@5.10; rough heavy, 4.40@4.70; light, 4.60@5.10; bulk of sales, 4.70@5.00. Sheep—Receipts, 30,000; sheep and lambs steady; good to choice wethers, 3.50@4.00;fair to choice mixed, 3.00@3.50; western sheep, 3.75@4.40; native lambs, 3.70@5.50; western lambs, 4.70@5.00.

DAIRY MARKET.

On the Produce Exchange today the butter market was quiet; creamery, 15@21½; dairy, 14½@18½; eggs, firm at mark, cases included, 19@21½; cheese, steady, 10½@11.

California Dried Fruits.

NEW, YORK, Nov. 4.—The market for evaporated apples continues firm on moderate supplies, and a fair demand. Common are quoted at 4@5½; prime, 5⅞@6; choice, 6¼@6¾, and fancy, 7. Prunes continue quiet and barely steady, with quotations ranging from 3¼@7 for all grades. Apricots firm; choice, 9¼@9½; extra choice, 10@10½; and fancy, 11@12½. Peaches are quiet and steady; choice, 7¼@7¾; extra choice, 7¾@8¼, and fancy, 9¼@10¼.

New York General Market.

NEW YORK, Nov. 4.—Wheat—Spot weak; opitions closed, May, 82¼; July, 79¼; December closed 82½. Hops and hides steady. Wool and petroleum firm. Coffee, spot Rio, steady; No. 7, invoice, 6⅛; mild, firm. Sugar—Raw, steady; refined, steady.

CITRUS MARKETS

ORANGES.

The Orange Market.—Sales in the past week in auction markets have been quite satisfactory, although there is some tendency to lower prices on account of heavy receipts of Jamaicas and Floridas, especially in Philadelphia. High grade stock, however, is selling all right in nearly all markets but this class of stock is scarce. Western markets have been taking a few cars, but many dealers are waiting for new crop navels.

LEMONS.

The Lemon Market is in a very satfactory condition. Sales at New York Wednesday, California stock, brought much higher prices than new crop foreign lemons. Western markets have been paying good prices for cars running heavily to 300 size. The auction markets on foreign stock are showing some weakness on account of the heavier shipments of new crop enroute. Indications would point to an easing off of prices somewhat the next two and three weeks.

NEW YORK, November 5.

Some Florida fruit is coming in, but not enough to affect the general market. The fruit is nice, but it is limited this year. As the demand is so keen for oranges the trade expects a fine season and say that if California will ship out regularly and not hold back and will keep stock moving prices will be profitable.

Receipts will not be real heavy until February. By that time the Florida, Jamaica and Porto Rico output will be about done. If California does not kill the market before that time by holding back and then shipping soft and wasty fruit, prices should rule firm, despite the big crop.

AUCTIONS.

NEW YORK, October 29.

C. C. U., Rialto, Bouquet Valencias, $4.15.

CLEVELAND, October 30.

C. C. U., Santa Ana, Dragon Valencias, $3.30; Dragon lemons, $3.05.

PITTSBURG, October 3.

Market steady.

C. C. U., National City. Sunset lemons, $2.75.

BOSTON, October 30.

Market steady.

C. C. U., Rialto. Marguerite Valencias, $3.15; Marguerite grape fruit, $1.50.

NEW YORK, November 2.

C. C. U., Rialto. Marguerite Valencias, $4.00; La Belle Valencias, $3.15.

BOSTON, November 2.

Market steady.

C. C. U., Rialto. Marguerite Valencias, $3.25. Cactus lemons; $4.15.

PITTSBURG. November 2.

Riverside F. C. Ex., Blue Print Valencias, $3.20. Criterion Valencias, $1.45.

CLEVELAND, November 2.

C. C. U., Filmore. Flamingo lemons, $3.25. Sunrise lemons, $1.60, 15 per cent decay.

WALNUT CROP OF HUNGARY.

Frank Dyer, U. S. Consul, reports that there will be from 150 to 200 car loads of walnuts in Hungary and the price will be $4.06 per 110 lbs. There will be no export of walnuts this year.

PRUNES.

Regarding the prune crop the same authority says:

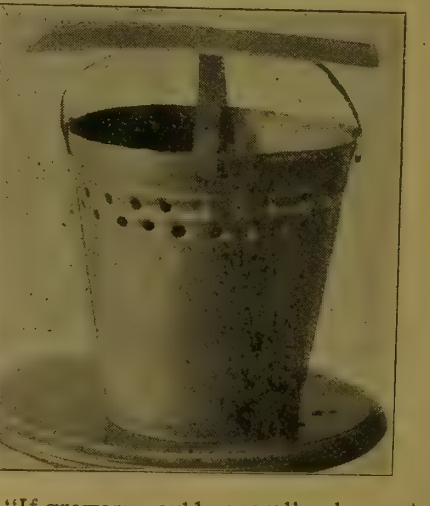
In general the new crop of prunes in Bosnia and Servia has not turned out to be larger than reported last June, and in consequence of a very weak crop the price of new prunes has risen about 1 crown per 50 kilos ($2.03 per 110 lbs). In October prices probably rise much higher, because instead of the usual 5000 carloads supplied by Bosnia and Servia together, there will be only from 3000 to 3500 carloads delivered this year.

NO BERRY PLANTS.

W. M. Gray, the Gardena berry man, thus writes the Cultivator:

Editor Cultivator:—Having received so much benefit in advertising my stock of plants for sale in the Cultivator for the last few years, I wish to communicate through its columns the information that I will not be able to fill plant orders from my own vines this year, as I leased my strawberries that I was growing for my trade.

I feel very grateful in the way my customers have treated me and hope to be with them again next year with a fine stock of plants for sale. Yours truly.—W. M. Gray.



SAFE AND SURE METHOD OF PREVENTING FROST

USE DISTILLATE

NO SMUT
SIMPLE AND
EFFECTIVE

Note the following extracts written by prominent fruit growers:

"If growers would generally place pots in their ranches, 25 pots fired per acre, in any frost we have had, would thoroughly protect the trees and fruit. I am sure many more will put in the oil pots next winter."—D. B. Bailey, Rialto, San Bernardino County.

"I am perfectly satisfied with the results. It furnishes sufficient heat to prevent frost damage during periods of cold weather and does not smut the fruit or trees. I find it even possible with these devices to carry the winter blossoms in my lemon grove through for summer crop."—N. W. Moodey, Glen Ellen Orange and Lemon Grove, Centerville, Fresno County.

"During the recent frosts the oil pots saved our crop except a few on the outside of the ten acres of Valencias."—W. R. Wood, Exeter, Tulare County.

"I found that, although the temperature fell to 20 degrees outside the protected area on January 16th, and again on February 14th, 40 pots to the acre gave me all the heat I needed for protection. I estimate that the crop saved on the Camilla orchard this season is worth $20,000. The fruit is heal hy, wtih fine fiavor, weight and color."—N. G. Simms, Camilla Orange Grove, Lindsay, Tulare County.

Some Good Things for Poultry

Armour's Beef Meal, made from Cooked Beef Hearts and Livers.

Seems Almost Too Good for Poultry

Only one place in the world where they accumulate so many hearts and livers that they use them for making beef meal for poultry.

At this place, the largest packing house in the world, they slaughter thousands of cattle, sheep and hogs and this is how they accumulate so many hearts and livers.

These hearts and livers are baked to a crisp; then they are ground into a fine meal.

The quantity is limited and a carload a month is all that can be had of this and we will use the most of it in preparing Coulson's Egg Food and Coulson's Chick Food.

We have a carload, 20 tons, 400 sacks, which will arrive in a few days and we can spare about 75 sacks of this meal. We will sell it in small amounts at 4 cents a pound. 100 lb bags for $3.50.

You can imagine how the little chicks will go for it! And for the old hens mix it in with the other feed and how they will cackle and lay!

Armour & Co. guarantee this meal to average more than 65 per cent protein. One pound equals four pounds of raw meat. That makes it as cheap as horse meat at less than one cent a pound. Being thoroughly dried, it will keep without spoiling and has no disagreeable odor.

And Armour & Co. guarantee that it contains nothing whatever injurious to poultry. A sample free for the asking. We hunt the world over for good things for poultry. Send for free sample.

Armour's Pure Blood Meal

Everybody Knows That Blood Contains All the Elements Necessary for Flesh and Egg Production It is a Valuable Aid to the Growth of Anything of the Animal Nature.

Hence it is not strange that blood, that is immediately cooked or dried and submitted to a process that makes it odorless, should be valuable to use in poultry food. There is a vast difference in blood meal. Most of the blood meal on the market is not fit for anything except for fertilizer.

We get blood meal from Armour Packing Company in the East in order to get the very best. A carload is on the way now.. This is one of the articles we use in preparing Coulson's Poultry Food. If you wish some of this good blood meal, we will be pleased to supply you. Price, small quantities, 5c a pound; 100 lb bag, $4.25. This blood meal contains over 80 per cent protein, one pound being equal to about five pounds of raw meat.

Beef Scraps===Choice beef scraps, fine ground, ready for use

The ordinary cracklings, or scraps, sold on the Pacific Coast are mostly pork scraps and contain too much fat to be fed very exclusively to laying fowls. There is another kind of so-called beef scraps that are the refuse of the renderings of soap works, and which are sold as high protein beef scraps. In order to get good beef scraps that are fresh and of good material we have made arrangements with a firm situated at the largest slaughter house in Chicago and the largest stock yards in the world, to furnish us with choice fine ground beef scraps in car load lots. A car load is on the way now and is expected to arrive now any day. One pound of this beef scrap is worth more than 2 pounds of raw meat, hence it is much cheaper than horse meat. We will sell these ground beef scraps at $3.25 per 100 pound bag and a little cheaper in ton lots. Send for free sample.

COULSON'S EGG FOOD

COULSON'S EGG FOOD is the best of all, as it contains everything complete to enable the hens to lay eggs in abundance.

When you feed Coulson's Egg Food you do not have to buy any of the other things, because everything is already mixed in this food. Beef meal, blood meal, fresh ground bone meal, charred bone charcoal, flax seed meal, willow charcoal, ground sifted oats, middlings, pea meal and other meals, and all things needed to make the richest and best egg producing food. We buy all these things in wholesale quantities at the very lowest cash prices. It is then thoroughly mixed by machinery in the right proportions by those who who know how and you have only one profit to pay. The poultryman that buys an article separately has to pay a profit on every single article he buys and conseqeuntly it costs him more money to mix a ration with only one or two articles, than it would to buy Coulson's Egg Food with everything complete.

Besides, the man who buys in small quantities has to take what he can find at the local stores and pay a big price for inferior articles, while we go thousands of miles in order to get the right kind of material. We do not use fertilizer stocks. Any poultryman is at liberty at any time to inspect the material we use in manufacturing Coulson's Poultry Foods. We are always pleased to show any parties through our factory as we are proud of the fact that we have the very best food articles obtainable.

Coulson's Egg Feed

Why You Should Feed It

It is a wholesome and safe food, contains nothing injurious. A correctly balanced ration, a scientific feed prepared by practical people who know how.

IT IS NOT AN EXPERIMENT. It is successfully used by hundreds of the most successful poultrymen and recommended highly. Fed as a warm mash either morning, noon or evening. SAVES BOTHER IN MIXING; YOUR TIME IS WORTH MONEY. Produces excellent results by natural methods. Price reasonable—CHEAPEST FOOD ON THE MARKET as it gives the best results.

GOES TWICE AS FAR as ordinary feed. INCREASES EGG PRODUCTION, furnishes bone, muscle, feathers and meat and helps fowls to grow. Pullets begin laying earlier. Shortens molting period. You can have eggs in winter when eggs are profitable. It is just the feed that all poultrymen are looking for—a feed that makes hens lay eggs nearly every day. ONE HUNDRED AND SEVENTY-FIVE EGGS PER YEAR PER HEN by feeding the hens Coulson's Balancel Ration Egg Food. Are you feeding your hens Coulson's Egg Food? If you are not, then you are making a great mistake. Coulson's prepared food for laying hens is just what your hens need and they must have it, if you expect them to lay many eggs at this time of the year. There is in Coulson's egg food everything complete to help the hen grow the eggs.

Mr. D. H. Ward at Cotati says: "I have fed Coulson Egg Food for over a year and I am well satisfiedwith it. I am now getting 90 dozen eggs a week from 500 hens. My hens laid well all last winter on Coulson's Egg Food and will continue to feed it this winter.

Others try to economize by buying cheaper feed, but they make a great mistake.

Price of Coulson's Egg Food at factory. We do not pay freight. One sack, $1.65; 5 sack lots, $7.75; ½ ton, 11 sacks, $16.50; 1 ton, 22 sacks, $33.00. We place on cars free of charge. Sample and catalogue of Poultry Supplies free.

CALIFORNIA CULTIVATOR

A WEEKLY JOURNAL DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES.

Vol. XXI—No. 20 LOS ANGELES, CAL., FRIDAY, NOVEMBER 13, 1903 Subscription $1 a Year

..Deciduous Pruning..

BY J. W. MILLS, POMONA

It is often that the success or failure of an orchard depends on the manner in which it is pruned. In the hot interior valleys where the great bulk of the deciduous fruit is raised, the trunks of the trees require almost complete shade to prevent their being sunscalded during the hottest summer days. The flat-headed borer is a death dealer to our deciduous trees if he has but half a chance, and that comes whenever a spot in the bark becomes injured by the heat of the sun. Trees which have their trunks shaded by the branches or wrapped with some covering, or even whitewashed, will not be troubled with these borers. A peach tree that is headed within six inches or a foot of the ground will live longer and bear better fruit than one which is headed to two or three feet from the ground. The trunk of a tree that is shaded and protected by the branches of the tree will not suffer while the owner is getting around to put some protection around it.

There is no set rule for pruning any kind of fruit tree, but the general idea to keep in mind is to so trim it that it will protect itself, maintain a stocky, strong and upright growth and all with due consideration of ease and comfort in cultivating.

There are some varieties in all kinds of deciduous fruits which have a spreading habit, and others have a compact habit of growth. Just why this is, further than that it is the nature of them to do so, is hard to explain. It is a good rule to allow all kinds of fruit trees to follow their inclinations of growth as near as possible, yet it is necessary to regulate these inclinations in some cases in order to cultivate properly and with ease. For instance, Alexander and Rhode Island Greening apple trees spread out flat if allowed to grow naturally, while yellow Newtown Pippin, Stump or Northern Spy will grow almost like a poplar tree if allowed to grow unpruned. Any tree that requires pruning in order to bring it into advantageous condition may be spread or contracted to a certain extent or by cutting to outside buds for spreading and to inside buds for contracting. Trees which grow in upright compact shapes usually produce fruit that requires much shade, but such a tree necessarily has a very limited bearing surface. A little spreading will increase that, but too much will allow the hot sun into the branches and loss will follow there, so these points must be kept in mind at pruning time.

No more than three branches should be left as the main branches of apricot, apple, peach or pear trees. These should be started the first year, so that they will be as widely separated as possible and on different sides of the trees. There may be what appear to be wide gaps left in the trees, but they will fill up in a year or two themselves, or the process may be hastened by pruning to a bud that will send a limb in that direction. This should be done some time after the second or third pruning. What may appear to be a very wide opening in a young tree will not be objectionable later on.

* * *

Of all deciduous trees, none require as severe pruning as the peach and apricot. The latter is usually pruned just after the fruit is picked in July, thus giving the remaining fruit buds time to develop and fill out during the latter part of the season. It is essential to cut part of the new growth very short, say to three or four buds, in order to keep the head of the trees from getting out of reach. The following pruning may remove the top branches which have borne some fruit and which would carry the head of the tree too high if moderately pruned, and the young shoots near the base, that come from the short pruned limbs may take their places. The strongest shoots should be used for head renewals, as they would if left too long, outgrow smaller and weaker shoots that may be cut back. This rule applies to both peach and apricot.

While apricots are usually pruned immediately after harvesting the crop, peach trees seem to be more thrifty if pruned during the winter or spring. Peach trees become full of dead stubs if pruned excessively during the summer. All wounds heal better if made during the early spring or when trees are at the height of their vigor. It is not practical to follow this rule in large orchards of mature trees, but in the home orchard or with young trees it is more desirable than very early pruning.

Bearing peach trees, after they have reached their fourth year, require at least two-thirds of their fine brush removed in at least three out of four prunings. It must be remembered that peach trees bear on the wood that grows during the previous year, and in order to procure a supply of vigorous fruit wood for each year, a vigorous growth must be secured each year, and this cannot be done without severe pruning. The heavy pruning should be done during the slack time of winter. We refer to the removal of top branches and those which are removed to thin out the interior of the tree. The light pruning, cutting in of the small laterals that bear the fruit buds, should be deferred until thinning time. There are two advantages in this, in case of a light crop, the leading laterals need not be trimmed back so close, while if heavy thinning is necessary, they should be cut back much closer. Any brush that does not carry fruit buds as is often the case in the inside of trees, should be removed during the winter pruning as it is much more rapidly done when the leaves are off the trees. Peach, like apricot trees, should be pruned to an open center, that is something like vase shaped. This admits the sun and better fruit is the result, besides distributing it more evenly throughout the trees, thus enabling them to carry a bigger load.

* * *

The apple is the one tree of all that requires proper beginning in the orchard. It grows to be a large tree and we find that if large branches are removed, decay follows very rapidly. It is therefore important that the first few prunings after it is planted should be done with the future tree in the operator's mind. Three main branches are plenty, and they should not be pruned shorter than two feet after they have made their first year's growth. If they are, it is likely that larger cross limbs will have to be removed afterward. It is better to have few branches well separated during the first three or four years than to be compelled to thin out when they become three or four inches in diameter. It is much better to protect the trunk and main branches during the first few years by whitewashing them than to grow a dense head and then thin out afterward. All large wounds on an apple tree should be painted over with a white lead and oil paint. We find that wounds made eight years ago still have a coating of white lead paint on them, while those not covered with any material are still black and full of decayed wood.

After the trees come into bearing, pruning must be regulated according to the variety. Some varieties, such as Rhode Island Greening, and White Winter Pearmain bear their fruit mostly on the inside of the tree, the heading back will not affect the crop very much. On the other hand, Yellow Newtown Pippin and Famouse bear a large part of their crop far out on the branches. Heading back of these varieties therefore cannot be done at one pruning without seriously shortening

(Continued on Page 367.)

In a recent issue of the Cultivator, John Isaac wrote of grape growing and in speaking of table grapes, he said; "The principal section producing table grapes is Sacramento county and the counties immediately surrounding it." We don't know that this is disputed, but there is also one little section up in Tulare county, next to Fresno county line, which claims to be "some" on table grapes, too. We refer to Dinuba. A few days since a crate of these grapes was deposited in the Cultivator office. The crate contained just eight bunches, weighing three to four pounds each. No word announced who they were from and all the expressman knew was that they were from Dinuba. As one of the Cultivator force was recently in the vineyard of F. H. Wilson of the Fresno nurseries and saw tons of just such grapes, we assume they are some of Wilson's Tokays. They are immense and as good as they look.

Governor Pardee to be at the Convention.—Governor Pardee has announced his intention of meeting with the fruit growers of the state at their next convention, to be held at Fresno on the 8th prox. Our present governor has taken a more than usual interest in this greatest industry of our state, and on the coming occasion will express his views in regard to it and learn from the practical growers what their requirements are.

* * *

Elwood Cooper's Enlarged Powers.—Hon. James Wilson, Secretary of Agriculture, has appointed Hon. Elwood Cooper, State Commissioner of Horticulture, as special agent of the Bureau of Chemistry for the purpose of investigating the character of imported foods and also to act under the law of July 1st, 1902, relating to falsely branded goods passing from one state to another. Mr. Cooper has always been a strong foe to food adulteration and sophistication, and this new appointment arms him with additional power to prevent frauds in this direction.

* * *

End of Fresh Fruit Season.—The late rains in the upper country have practically ended the grape season, so far as shipments are concerned. There is still a great deal of fruit picked for shipment which will go forward, and some selected grapes may be forwarded for several days yet, but aside from these the fresh fruit season may be said to have closed. Shipments for the season have been 7354 carloads, an excess of 343 carloads over last season's exports to the same date. All of this came from within a radius of fifty miles of Sacramento, which covers the fresh fruit section of the state.

* * *

Emperor William.—The published statement that Germany's ruler may be suffering from a malady of the nature of cancer, which killed General Grant, has startled the empire, and set the world to guessing as to the real nature of the disease. Because the doctors say there is no need for apprehension does not alter the fact that the Emperor is a very sick man. It will be remembered that Emperor Frederick died of cancer of the throat after a reign of a few months. In the case of General Grant, who died of throat cancer three years before Emperor Frederick, the cause of the malady was almost identical with that of Frederick. Grant died July 23, 1885, and Frederick June 15, 1888.

* * *

Possible Conflict.—There may possibly come war between the United States and Colombia, by reason of this government recognizing the new republic of Panama, but such a thing is remote. The United States of Colombia has entered a protest against the action of this government by reason of the acts that have occurred on the Isthmus of Panama, and certain statesmen affect to believe it to be but the forerunner of a more decisive protest on the part of the Colombian government.

It would seem futile in the extreme, in a government which was not able to stand before a revolution, whose fighting force numbered less than 10,000 men, to attack a republic whose munitions of war are so complete as to wipe it off the earth in a single engagement. But such is the fighting blood of the Southland that no overwhelming odds will stop it when once its anger is aroused to fighting heat. So we may have to repeat our experience in Cuba and the Philippines before our position is thoroughly understood and respected. There is nothing in the claim of Germany that this country is at the bottom of the insurrection which has dismembered the Colombian government. The canal treaty may affect our interest in, and friendship for, that country, to some extent, but it is not in the nature of our leading statesmen to lend aid or sympathy to an insurrection merely for the purpose of gaining the canal treaty which we can secure by attachment.

* * *

Doubtful Showing.—The Cuban reciprocity treaty will experience serious opposition in Congress. It may not get through at all, and, so far as Californian interests are concerned, it ought not to.

The proposed measure is in direct opposition to our commercial tariff, and if passed, would seriously cripple our condition, as we view it. Mr. Cannon, the new Speaker of the House, thinks there will be harmony between the two wings—the Senate and House of Representatives—and that the measure will pass in some form. But there are senators who are prominent in their opposition to it and who aver with equal certainty, that it can not pass as a resolution, but must go through as a bill. This would open up the whole tariff question and might prove very troublesome at a time when no friction is desired. So if we are to interpret the indications rightly the Cuban treaty will not go through in the form it has been supposed it would, and there are strong indications that at the last moment a hitch may occur between the two houses which will tie it up indefinitely.

* * *

Our Growth.—The state controller has issued a statement of the taxable values of California. This sum he places at $1,598,603,226.

The land values he estimates at $848,490,266. Improvements on this land $352,635,409. Personal property foots up $269,488,904. Assessed mortgage values aggregate $151,520,861, and railroad property $84,187,758. Taking the population of the state as a basis from which to compute, the value of the state's wealth would be over $1000 to every man, woman and child. It should be bourne in mind that this estimate includes only assessed values, which is not the market value by from fifty to sixty per cent. Add this to the assessed wealth—or the wealth in sight—and you have an array of figures which is pleasing to contemplate, when we consider the fact that the state is but little more than half a century old.

* * *

Speaker Cannon.—The Fifty-eighth congress assembled at Washington on the 9th, promptly elected Joseph Cannon, of Illinois, speaker of the House. Mr. Cannon has long been an active member of the House of Representatives, and honored by both political wings of that body because of his sterling honesty. It is safe to say no visionary bills will pass his notice, nor will any wildcat schemes nor unmerited appropriations get through congress so long as he controls the situation. He is not as brilliant as Henderson, but he is just as safe.

* * *

A New Convention.—Strong Probability exists that the subject of the Panama canal treaty may receive immediate attention by the new republic of Panama. A committee has been named by the government and will shortly approach Mr. Hay, our Secretary of State, with a proposition to open the subject and conclude a treaty without delay. This is, of course, what this government desires, and the speedier the convention is held and negotiations closed the better will the situation be handled all around. The Colombian government has made a proposition to open the defunct proceedings of the old convention but Mr. Hay holds, nothing can be done in this direction as that authority is dead by reason of time limit.

* * *

Demand for Locomotives.—An almost unprecedented demand has been made this week for motive power by many leading transportation lines of the country. The Seaboard Air Line has put in an order for thirty up-to-date engines; the Pennsylvania lines west of Pittsburg are to have eight new machines, and the Belgian state railways have asked for bids for 100 locomotives of American make.

Orders for new engines have been placed six months ahead with the American Locomotive Company, and also with the Baldwin works. There is enough work in sight to keep the plants of those two concerns running all winter. The first named company is at work on an order from the Missouri Pacific railroad for thirty-five powerful engines. The Rock Island, the Southern Pacific, Union Pacific and Santa Fe lines have been increasing their motive and transportation facilities during the past year as rapidly as their orders can be filled. All this goes to show a tremendous growth in the country's business and unlimited confidence in the future prosperity of the entire country.

Paying the Mortgages.—All the Pacific Coast States are in the front rank of American prosperity. A review of the business situation, at the close of the month of October shows the farmers of California, Oregon and Washington in the front rank of the states discharging their debts and paying off their mortgages.

The unusual high prices paid for wheat, barley, hops, stock and fruit, allows a surplus to be used in the discharge of obligations. In California, extensive improvements are being made on forms throughout the grain districts, these comprising new houses and barns, larger orchards and the buying of blooded stock. Many farmers have purchased property in near-by towns, and are building homes for the winter, whence their children can go to graded schools. This augurs well for the spirit of progress which abounds in the people. It also augurs well for the general growth of the Pacific Coast States.

* * *

Farmers to Make Prices.—The Advisory Board of Credit at the convention of farmers societies held in Chicago in September, has issued a call for a meeting in December.

The object is to bring about a concerted action among all the farmers' societies and organizations "to secure equitable prices on farm products and to guarantee to consumers food products at a fair price, and not loaded by trust profits."

If the farmers can accomplish this they will confer a lasting benefit on the people of this country. And, after all, why not? If railroads and steel manufacturers can establish trusts, and dictate prices to consumers, why may not the agricultural producers combine to regulate prices and protect the public from imposition?

* * *

Governor Got there—Nebraska is credited with having not only politicians of acumen, but politicians of genuine sense and practicability. In the selection of a granger governor last year, the state made a hit. He was a fighter in time of war, and he is a hustler in time of peace. A dispatch from Lincoln this week states that Governor Mickey stood on a stack of wheat at the farm of the State insane asylum at Lincoln and tabled bundles for a thrashing machine, so fast that the feeders were kept busy. The governor was being shown over the field when he climbed a stack and shed his coat. Even bets were offered that the governor could not keep the table full, but he did.

When Samuel J. Kirkwood, famous as Iowa's war governor, was a candidate, he was challenged by his opponent to a harvest match. It is told of the contest that it was witnessed by hundreds and at the conclusion of the match Kirkwood had his erstwhile enemy on the shady side of the straw stack, tetotally whipped.

* * *

The method adopted by J. Corwin Jacks, of Batavia, New York, to spray fruit trees will surely attract the attention of California growers. He sprays with dust composed of ten pounds of powdered lime; one pound of paris green; one pound of sulphate of copper and one pound of sulphur. It is powdered and is applied with a blower fed by compressed air. One gallon of the preparation will spray 50 to 75 large trees. Mr. Jack's contention that it is superior to liquid sprays, is endorsed by Prof. Craig, of Cornell University, and others.

..General Agriculture..

THE LIMA BEAN.

While the lima bean is grown in vegetable gardens for local or home use in nearly every state in the Union, its culture on an extensive scale as a commercial product is confined to California, says a report of the California station. In Ventura county and in counties adjacent thereto between 40,000 and 45,000 acres are devoted to the lima bean industry.

The acreage is much smaller than in former years, due to extremely low prices prevailing prior to 1900, to three seasons of drought resulting in crop failure, except on irrigated lands, and to the growing of sugar beets on large areas formerly devoted to beans.

The lima, which is a pole bean in other sections of tht United States, is grown without poles or other support in the California "bean belt." The vines pile themselves along the rows and bloom and pod profusely unless checked by drought. The beans ripen during September; those grown farthest from the sea ripen first and cure more quickly when cut than those grown nearer the coast.

The crop is harvested by means of sleds with knives attached to the runners and drawn by horses or by the more modern wheel cutters. In from two to four weeks after cutting, the beans having cured, are thrashed, either by steam thrashing outfits, which move from field to field, or by the method known as "tramping," which separates the beans by means of horses and carts or other vehicles, driven over the vines previously piled on prepared earthen floors, the straw being constantly turned and moved with pitch forks. The latter method, while slower than the former, is said to be not more expensive if the weather is dry.

The average cost of production is in the neighborhood of $2.25 per cental. When properly cultivated, from 1200 to 1500 pounds can be produced per acre on good land in favorable seasons; in the best localities as high as 2000 pounds per acre have been grown. The prices realized by the growers fluctuate considerably. The crops of last and the previous season will probably average $4.00 per cental, yielding handsome profits.

Accurate statistics of production are not at hand, but the estimated yield last season was 550,000 sacks of 80 pounds, and it is believed that this year's production will equal, if it does not exceed that of last year.

FARM IMPLEMENTS EXPORTED.

Few articles show a more rapid growth in exportation than do agricultural implements, or a wider distribution. The total has grown from a little over half a million dollars in 1864 to over $21,000,000 in 1903, or nearly forty times as much in 1903 as in 1864, while manufactures of iron and steel, in which the growth has been looked upon as phenomenal, are only about thirteen times as much in value of exports in 1903 as in 1864. The distribution of American agricultural implements has also extended to nearly all parts of the world. The bureau of statistics' export statement shows that reapers and mowers were sent in 1902 to over fifty different countries and dependencies, and plows and cultivators to even a larger list of countries and dependencies. The sound of the American mower and reaper is heard in British, French and Portuguese Africa, in Egypt, in European and Asiatic Russia, in Japan, in India, in Australia and in practically all the South American countries and all of the countries of Europe, while the American plow and cultivator go to practically every country in the world.

LOOK OUT FOR BORERS.

It will pay every farmer, whether he has but a dozen trees to supply his own family, which he has put out in the last eight or ten years, or a large commercial orchard, to take time in the next week or ten days to examine the trees carefully and see if there is any evidence of the work of the borer. The eggs of these borers are laid in June. By this time the little rascal has been hatched out and is beginning to work. You will find him about the root of the tree from one to six inches above the ground. You will likely see some of his chippings, or perhaps nothing more than a dark spot in the bark, which the point of a knife will show to be the path of the borer. He goes around the tree, and if let alone will girdle it almost as completely as it could be done with a knife. Follow his path, get him out and execute him; or if he has bored into the body of the tree, put a wire in after him and destroy his capacity to do the mischief in the future. If you should not do this, you may find out by next May or June that one of your young trees is about dead. If you will examine it then, you will find that the borer has girdled it. It is better to attend to it now, and the sooner the better.—Farmers' Wife.

PROFIT IN FARMING.

Farming does not give the largest profit compared with many other industries, but it affords more security to those who invest in that direction than any other, as the one who owns a farm without encumbrance has an opportunity to apply his labor, and labor itself is capital, the combination of farm and labor being really the union of capital and labor. It is true that during some years the farmer will make little or no profit, but he has the opportunity of producing a sufficiency for his own use and is not compelled to pay rent. Another point is that a well-cultivated farm becomes more valuable every year, as a large proportion of the profit is stored in the soil.

Ventura county bids fair to be a pioneer in the making of good roads. Petitions are being circulated asking the supervisors to take steps looking to a bond issue of $500,000, the money to be applied alone to a system of roads throughout the county, and these petitions are being generaly signed by the taxpayers. There are some good roads in the county, about thirty miles of the highways being oiled, but many roads are in bad condition, owing to the character of the soil and the great amount of heavy hauling necessary in moving Ventura county's heavy crops.

Ellis W. Roberts, treasurer of the United States, at the late bankers' convention held in San Francisco, said: In manufactures the American people are far and away beyond rivalry. Against our $13,000,000,000 of annual product, Great Britain shows $4,263,000,000, France $2,900,000,000, Germany $3,375,000,000 and Austria-Hungary $1,596,000,000. These four great nations turn out in manufactures $12,116,000,000 a year, or a billion dollars less than does this country alone. From 1890 to 1900 the annual product of our manufactures grew from $9,372,437,283 to $13,039,279,566. Our imports of merchandise ran up from $789,310,409 to $849,941,184, and our exports from $857,828,684 to $1,394,483,082.

By J. W. Jeffrey, Los Angeles

WAS IT A COMPROMISE.

The formation of the California Fruit Agency last April was thought by a few to have been precipitate, those offering the most persistent opposition not having been in touch with the co-operators who had been striving for ten years to bring about by agitation what was accomplished by agreement after only one month of consideration. To those who had given the subject of fruit selling careful consideration the establishment of the Agency was but the culmination of the struggle, along the lines of least resistance and the only result possible except that of retrograding to the conditions of the early nineties. Hence, what seemed precipitate action to some was but the working out of natural laws that govern attempts to establish complete co-operative control of the marketing of a commodity. It is but the statement of a well-known truth to say that the line of greatest resistance to such control was the growers outside the Exchange, and not the fruit merchants who formed the front of the opposition to the Exchange plan of selling fruit. This opposition being found insurmountable, after seven years of severe trial, and the necessity of full control being a cardinal point of success of the plan, the only possible solution was to unite the agency, through which the outside growers had been able to prevent it, with the agency of the Exchange. The experience of ten years of commercial war proved that one-half the growers would not join in the co-operative plan, and that the fruit dealing firms could not do business with the outside half of the fruit that was satisfactory to customers. Under these conditions neither contingent could produce safe and satisfactory results and the formation of a co-operative agency was inevitable, unless the growers were willing to abandon all efforts of a mutual character. From these facts we conclude that the California Fruit Agency was but the working out of natural laws, holding that these conditions were brought about by the volition of those who did not approve of the effort to form a universal agency embodied in the original Exchange plan.

Co-operation is the joining together of kindred interests for the purpose of more effectively competing with adverse interests. It recognizes that many of the differences between commercial classes are permanent and yet assumes that the advancement of the interests of each member will be for the good of all in a general way. The most perfect form of co-operation is gained through the trust. The beneficiaries are few, to be sure, when compared with the magnitude of the business done by some of our leading trusts. The modern devices through which the stockholders of a corporations surrender their voting power to a board of trustees, is the acme of co-operation, inasmuch as it places every element of a complex and otherwise competition business in perfect accord, makes possible the most economic production of the commodity handled and destroys competition. Not only is this modern corporate invention against the interests of the consumer directly, but it is contrary to good public policy for the stockholder of a corporation to divest himself of his voting power and rest it in a committee of control as the management of a trust, is sometimes called. The result of the stockholder's separating himself from his voting power has been brought before the public in a startling manner lately in the developments of the great steel and shipbuilding trusts. A system that can produce a Schwab is not good for the body politic or helpful to the final success of even the members of the trust itself, and may be termed in its application to the shipbuilding interests the very apothesis of graft and rascality. The abuse of this centralized power has become so common that students of commercial economics see in it the downfall of many of the schemes of monopolistic tendency. That many of these industrial units called trusts have already overreached themselves and gone to pieces, and that the attitude of the present administration is discouraging to the further oppression of capital are most faithful indications that only co-operative institutions not in conflict with true economic law and the policy of state are to be popular with the people. In this tendency we see the principle exemplified that business is a science and failure must come sooner or later from the violation of the laws of this science.

Now, from all the above, we reason that, if the kindred interests of the citrus fruit business have been joined together by the Exchange and the Citrus Union in a marketing institution that does not violate natural business laws of public policy, the combination is neither a trust nor an ephemeral enterprise and must have recognition as one of the useful institutions of the country. In the first place we see that the controlling power is retained by the individual stockholder of the associations composing the Exchange and indirectly by the customers of the Citrus Union. Under the present advancement of the co-operative idea this controlling power is as near perfectly fundamental as possible. Experience of the last few years has proven this. The culmination of the use of this power is the California Fruit Agency. If it is the trustee or governing committee it is subject to an annual reckoning with the source of its power—the fruit growers. Before these two halves of the citrus industry united the industry presented the anomaly of civil commercial war; the promotion of internal competition that made the business the easy victim of other competing fruit industries; the whole business as the two lobes of a brain thinking adversely and giving impulse to antagonistic action in the same body. The state of affairs preceding the formation of the Agency was public display of an irreconcilable difference between two contingencies in the same industry, and had to be reconciled before the citrus industry of California could do otherwise than invite outside opposition and continued internal strife. The present unity has done the ultimate in unifying the business as far as possible under the present state of co-operative progress. In bringing about this unity the co-operators have not violated good public policy. They have removed a number of useless elements, but accomplished it without injury to the public or wronging the individual, for if an individual has intervened between the producer and consumer without helping either, he has no rights that should be respected. With this view of the case, no one is justified in fighting the Agency under the pretext that it is a trust-like combination, or a detriment in any way to any interest that has a right to exist. If any one asks you if it is fair to shut out one-half the growers from the benefits of purely co-operative advantage, answer that it is not possible either to shut out or include those who have not adopted co-operation of their own volition, for the very term "co-operation" means voluntary, mutual action. As long as the policy of the California Fruit Agency recognizes purely representative control and keeps pace with the growth of the co-operative idea, no criticism of the present combination can hold. It cannot go in advance of the principle as held by the individual and it will not lag. We need no chart of business principles to confirm the advisibility of this combination—the chart of business experience making for the last ten years having furnished the data necessary for continued action.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO

UNJUSTLY CONDEMNING THE UNIVERSITY.

It is a common fault with most people that they jump at conclusions without due thought or consideration. This is being done now in the case of the disappearance of the ground squirrels in the northern counties. A long time ago, some of the professors of the State University experimented in Contra Costa county with a serum which was supposed to cause rabies in squirrels. Nothing came of the experiment, and it was forgotten. Recently, however, a disease has broken out among the pests and they are disappearing. More recently a disease has broken out among the cattle in some sections of Contra Costa county and now all these facts are lumped together and the university professors are being blamed for the cattle disease, for it is as clear as mud that once the professors innoculated some squirrels, that now the squirrels are disappearing, that some cattle are sick, therefore, following this line of logic, the university professors are responsible for the sick cattle, and some of the northern papers are raking them over the coals for their wickedness in thus injuring the cows of Contra Costa county. It is very improbable that there is any connection between the disappearance of the squirrels and the cattle disease, and much more improbable that the experiments tried with the serum have had the effect of killing all the squirrels, as their disappearance is not confined to the section where the experiments were tried, nor did it start there and spread, but it has broken out simultaneously over most of the northern counties and in sections remote from the point of experimentation. Moreover the disease has none of the symptoms that accompany rabies, and is probably a different thing altogether from that which the university people tried to introduce. This much should be said in defense of the gentlemen who are doing so much good work for our farmers and who are now being heartily denounced in some quarters for a matter over which they have had no control and for which they are in no way responsible.

* * *

GOOD OLIVE PROSPECTS IN THE NORTH.

Reports from all the olive sections of the north are to the effect that the crop this season will be a very good one, equal if not superior to that of last year. The principal olive counties of Northern California are Santa Clara, Contra Costa, San Joaquin and Butte, and all these give the same report in regard to the coming crop. The season is somewhat later than usual but the fruit is large and well formed. There has been very much interest manifested in olives in this section of the state during the past few years and some very large orchards have been planted; these are now coming into bearing and adding greatly to the olive output of the state. The olive seems to be a general favorite and does well in nearly every county in the state where actual winter weather is not prevalent. Very large areas have been planted in Tehama county, especially around the Maywood colony, where it is the principal fruit now being cultivated.

* * *

RUSHING INTO DECIDUOUS FRUIT GROWING.

The past season has been one of the most prosperous that the growers and shippers of deciduous fruits have had for many years past, and nearly every car sent out brought to its shipper a profitable return, while in some cases the returns were very large. Of course, this is an encouraging condition of affairs and every one wants to share in the good fortune of the fruit growers. As a consequence there is serious danger to be apprehended that we shall pass through the usual experience of good times, and have a rush into the profitable business until we find it so badly overdone that there will be no profit for any one. Signs already point that way, and nurserymen in the upper country state that the demand for nursery stock the coming season promises to be heavier than ever and deciduous fruit planting more extensive than in any previous year. This has been the experience of the grape growers. The past few years of good times gave so great an impetus to vineyard planting that the wine makers claim they are afraid for the outlook and are compelled to hedge. However this may be, it has given them an excuse for cutting prices and the late planters will suffer. It may be that the good prices received for deciduous fruit this season will have the same effect and that another season will see a great slump in prices.

* * *

PEAR BLIGHT IN THE NORTHERN COUNTIES.

Pear blight, which has done so much injury to the pear and apple orchards of the southern San Joaquin valley, is reported from several sections in the northern counties. It was hoped that this dread disease would be confined in its attacks to the section in which it first appeared, but it has now shown itself in sections remote therefrom and from each other. So far it has not appeared in the great pear belt along the Sacramento river, but it is uncomfortably close to it. The pear crop along the river this year suffered greatly from crater blight and pear cracking and the value of the fruit, for both shipping and canning purposes, was very much reduced on this account. These diseases are unlike the pear blight, which is a bacterial disease and works through the cambium layer, or the sapwood. This disease is covered and cannot be reached by any remedies. It is insidious in its work and frequently its presence is not suspected until the tree is so badly involved as to be beyond relief. The other diseases are the effect of a fungus growth and may be relieved if not wholly checked by the proper application of a fungicide, the salt, sulphur and lime wash in the winter season, and Bordeaux mixture later in the season. The theory of the diseases is that they are propagated by spores which find lodgment on the twigs and branches of the trees in the fall, when they are shed from the parent growth, and remain dormant until conditions favorable to their germination are presented in the spring, when they attack the twigs and fruit with virulence and spread with amazing rapidity until, unless checked by some fungicide, the whole tree becomes involved and little good fruit will be produced. If, while these spores are still dormant, some effective remedy is applied, the greater part or all of them are killed and the disease is checked. It has been proven that there are no better fungicides than sulphate of copper and sulphur and these form the effective agent of the washes recommended.

* * *

A GOOD DRYING SEASON IN THE PRUNE DISTRICTS.

The season has been a most favorable one for the prune and raisin dryers in the northern counties. The weather man plays sad pranks with us sometimes, and sends a heavy and unwelcome rain at the time when it will do most harm to the fruit on the drying trays, and often supplements this with cloudy weather to the detriment of the drying fruit. This season we have escaped and been favored with exceptionally good weather all through the drying season. This has gone far toward compensating for the shortage in the prune crop, and, together with the improved quality of fruit and better prices which it is commanding, puts the prune growers in better shape than usual.

* * *

THE OLIVE KNOT IN BUTTE COUNTY.

The olive knot (Bacillus oleae), has got a firm foothold in Butte and Tehama counties and in the latter little effort is being made to eradicate it. In Tehama county wherever a diseased tree has shown itself it has been promptly dug out and destroyed, but in the affected orchards of Butte county the disease has been to a great extent allowed to run its course to the great danger of clean sections. Fortunately this disease is not so rapid in its spread as some other diseases of orchard trees and its progress has been slow, but on this account it should be the more readily handled and measures taken to extirpate it before it gets beyond control. This disease was first discovered in Merced county in 1893, and though it has been with us

The Hoyt Tree Support

SAN DIMAS CITRUS NURSERIES
SAN DIMAS
DISTRIBUTOR FOR SO. CAL.

for this length of time it is still confined to a comparatively limited area. There are yet some few affected trees in Merced but aside from these, the principal area of infestation is in Butte county, where there are some very bad cases. The disease is a very serious one where it gets a foothold, involving the whole tree, from the fibrous roots to the leaves, no part escaping, and there is no known remedy except fire and the total destruction of the diseased tree. Some effort should be taken in the interest of our olive growers to extirpate this disease while it is yet within control, for should conditions arise under which it should become epidemic, and such may occur, it would prove the bane of our olive industry.

* * *

INSPECTING FRUIT AND STOCK FOR EXPORT.

The horticultural inspection laws of many of the states provide that no stock shall be admitted which is not accompanied by the certificate of an inspector of the district in which it is grown, to the effect that it has been properly examined and found free from insect pests, and very many of the horticultural commissioners of our own state issue such certificates although there is no law requiring or authorizing them to do so. The object of our horticultural commissions is to protect the counties from which they are appointed and to keep pests out. It does not matter to them how much diseased or infested stock is shipped out of their counties so long as they keep other counties or districts from shipping such stock in. It is a most unreasonable thing for any state to expect us to look after their interests; we have all we can do to look after our own, and it is equally unreasonable that we should expect outsiders to carefully inspect stock which we are to plant. Yet this is just what the horticultural laws of many of the states require. There are some conscientious inspectors who would do their duty in such cases but the greater part would shirk and let the man who received the stock suffer. How such a system of inspection would work is well illustrated by the following account of how it is done in Australia, where there is such an inspection law, and we cannot expect better work in all cases to be done here. This is from "Garden and Field," an agricultural paper published at Melbourne.

"We have our doubts about an inspector unless he is subject to some direct authority. Recently we accidentally witnessed a fruit inspector "passing" fruit for export. Incidentally we may say that "passing" is a very good word and highly appropriate. He was supposed to give a certificate that the fruit was free from disease, and this is the way he did it. The packers had been busy for some hours, and had a big pile of cases ready to go away. The inspector arrived and after greetings said, pointing to the pile, "This ready?" and on being told yes he produced a pad and rubber stamp and dabbed it on the end of each. We said, "What is he doing?" The packer replied, "Inspecting fruit for export to New South Wales." "Is that the way it is always done?" we asked, and the reply was, "Yes, that is the way, but it won't be admitted without his certificate." In the meantime the inspector squatted himself on an empty case, filled his pipe, and smoked while the balance was getting ready, but he never looked at anything. Had we been told this we could hardly have believed it; but that is an exact account of what happened.

By J. W. Mills, Ontario, Cal.

PRUNING DECIDUOUS TREES.

(Continued from first page)

the crop. As the branches become too long and high on these varieties, a few may be shortened each year until the tree is brought into proper shape. If a little light pruning is begun at the proper time, there will never be occasion to do any very heavy cutting back.

No fruit trees should have the small brush that hangs down and shades the trunk, entirely removed. If it becomes necessary to remove it because it contains dead brush, cut to some healthy bud so that it may send out a new shelter to shade the lower part of the tree. We often see persons who are accustomed to pruning in the Eastern States cut all of this brush off close to trunk or main branches. It more often than not means the death of the tree.

The same general rule for starting young apple trees in the way they should go, may be applied to pear trees, though the pear is a much hardier tree and will stand abuse that would kill an apple tree in a short time. Most pears have a habit of bearing the most of their fruit on the outer ends of their limbs some seasons, and especially after a big crop on the interior of the tree. This point should be watched and the trees lightly pruned during such seasons or 90 per cent. of the crop will be cut off in the operation. Heading back the pear should therefore follow the light crop that comes on the outer ends of the trees.

The generally accepted method of pruning French prune trees, is to cut them off about three feet from the ground and allow them to form their own heads. If there be any which show an inclination to form the head in a bunch, some of the shoots should be pinched off before too great a flow of sap becomes directed to that point. By pinching in time, other buds will be forced out lower down and a more even and natural distribution of branches secured. Do not prune them at all after the time of planting and as perfect a tree as it is possible to grow will be secured.

SPARE THE TREES.

Under the above title the Alameda Encinal makes a strong appeal to preserve the shade trees in California country towns and along the roadways.

"It does not seem possible, says the Encinal, that in this day and generation any intelligent man can be found who will deliberately authorize the destruction of trees of any kind whose removal is not absolutely necessary. The immediate cause of the remonstrance is the cutting down of some trees in a public park which are at least a quarter of a century old and were doing no harm, but on the contrary were a distinct addition to the attractions of the place. The only objection was that these trees littered up the ground by shedding their leaves! Truly a cogent argument! Some one should invent a brand of trees that does not shed its leaves and commend it to the Riverside authorities. To chop down a tree in that region for no better cause than that cited is little short of a crime. Instead of cutting down trees no occasion should be lost for planting them, and when once started they should be guarded with religious care. If there is any place in the world where the woodman or any other person should spare the tree, it is California, and especially those sections where they are only raised with such infinite care as in the naturally barren plains and interior valleys."

There are other cogent reasons why California shade trees should be preserved. The more shade trees we cultivate the more rainfall we shall have and the more moisture the earth will retain. In a country needing moisture as much as Southern California usually does, every condition that will bring rain and conserve it ought to be encouraged. Shade trees will bring rain and they will also preserve the moisture, therefore they should be planted, not cut down. Let the coming rainy season see hundreds of thousands of shade trees planted, and each successive winter let them be put out until we bring all the rain we want. If trees grow too plentifully and too big they can be cut down for wood.

The Sacramento County Humane Society propose to prosecute some people in that county for overloading and abusing their horses. They have served notices upon the guilty parties.

Fresno Nurseries

ESTABLISHED 1889

We Sell Nursery Stock That Will Grow and is True to Name

We grow what we sell and are therefore in a position to know what we are furnishing the planter. In our nursery we have about 400,000 fruit trees, comprising all the leading varieties of deciduous stock. Also shade and ornamental trees, roses, palms, etc.

We call special attention to our stock of grape roots. Cuttings have been selected from nothing but strong and healthy vineyards and have been fumigated with hydrocyanic acid gas before planting in nursery. We can absolutely guarantee this stock free from disease. The list comprises all the leading wine, table and raisin grape varieties, also resistants.

P.O. BOX 14 — FRESNO, CAL.

Conducted by PROF. A. J. COOK, Claremont, Cal

The editor of this department will be glad to receive insects or plants that interest the subscribers for the CULTIVATOR, and will engage to identify and name the same, and, so far as possible, advise treatment in case the species are harmful. Insects should be put in close, strong boxes. They need no air other than the box affords. All possible information regarding the habits of insects should be sent with the specimens.

MALLOPHAGA OR BIRD LICE.

Every bird fancier and every chicken breeder is familiar with these bird lice. Linnaeus placed them with the true lice which I have already described, with the bugs in the order Hemiptera. They are, however, very different from the true lice in form and general appearance, and would, from this alone, be separated by most people from the common lice. Like the true lice, however, they pass through incomplete transformations and are wingless. Yet, as we remember, all bugs, including the true lice, have sucking mouth parts, and so the true lice live on blood which they suck from their suffering victims. These bird lice, on the other hand, have biting mouth parts and so eat or bite, rather than suck. Without doubt, they should be separated from the order Hemiptera. They are now generally grouped in an order by themselves under the name Mallophaga. This word means wool-eating and is appropriate from the fact that they often infest sheep and subsist on the wool of these animals. These lice feed on feather, hair and the skin of animals and attack not only sheep, birds and chickens, but many other of our domestic animals. They concern most poultrymen and are often a serious pest in the poultry house. We see, then, that the chicken fancier is troubled with three kinds of chicken vermin or parasites, the mites and common lice already described, and these bird lice. Of course these latter are easily distinguished from the mites, as the latter are rounded insects while these are elongated. The mites, also, when mature, have eight legs, while these, like all insects, have only six. From the true lice they are easily told by their very peculiar form. The head, instead of being narrow, is broad and they are much narrowed just back of the head. Thus they seem to have slim waists, and if insects ever did practice tight lacing, we should certainly be likely to accuse these bird-lice of this pernicious practice. The remedy for all these three pests of the poultry house is one and the same. Kerosene oil is the sovereign cure. As before stated, I would mix this half and half with lard and apply it to the chickens after they have taken their roosts at nightfall. It is kept in a close covered pail that it may be clean from dust and by the use of a glove is applied to the breast, under the wings and on the thighs of the chickens. It should not be applied to hens that are brooding chickens but such hens should never need any such application. Great pains should be taken that they be entirely free from vermin before incubation even commences. The roost poles should occasionally be smeared with the same ointment, while it is wise to spray the entire house and yard frequently with kerosene emulsion or kerosene and water carefully stirred together. Distillate spray would be admirable for this same purpose. It is also wise because of these lice and also for neatness' sake to spray the house inside very thoroughly twice a year with a whitewash so thin that it can be applied with a spray pump. Pyre thrum or Persian insect powder is also much used and with no little satisfaction in fighting these various poultry vermin.

It only remains to be said that one of the greatest causes of failure in poultry keeping comes from these pestiferous lice. Hens worried in this way will never do much egg laying. How many farmers pay no attention at all to ridding their poultry of these disturbers. The poultry use up all their energy in trying simply to endure life. It is fortunate, however, that rolling in the dust helps greatly to mitigate this evil of poultry lice and mites. As most farmers allow their poultry to run in the open they have free access to boundless dust baths and thus are constantly engaged fighting this lice evil.

It will be noticed that I have placed the bird lice and the thrips in separate orders, thus removing them from the group where they were placed by Linnaeus. I think there can be no doubt of the wisdom of this separation and I have little doubt but that the arrangement which I have followed has come to stay. We shall separate thrips from the bugs under the ordinal name of Thysanoptera and these bird lice will continue to be known as Mallophaga. Both of these groups of insects concern our people in Southern California and it behooves both orchardist and poultryman to study carefully what I have said regarding both these orders. The thrips are doing much damage in our orchards while the bird lice are making life miserable in many a poultry yard.

* * *

PHOSPHORIC ACID.

I have been asked several times of late, what would be a safe practice in fertilizing our citrus orchards. The sowing of peas is always to be commended. I am happy to say it is becoming a very general practice in this region. I have been delighted to see the area planted to peas is increasing year by year. This year there has been much more planting than ever before. In most orchards the plants are already well up and will be in condition to plow under before the winter is past. Thus they will decompose by the winter rains and will assuredly show rich results in the coming years. These peas will not only give much needed humus, without a goodly quantity of which no soil can be at the maximum fertility, will also furnish very cheaply the nitrogen which, as we all know, is by all odds the most costly of the fertilizing elements which we must add to our soil. This practice also loosens the soil so that oxygen can gain access and minister to the well being of the countless millions of minute bacteria which are indispensable to every fertile soil. A good growth of any green manurial plant plowed under in February will also increase the moisture during the coming season. So another reason for plowing under a green crop.

It is wise to use stable fertilizer in case it can be secured at figures that will make it pay. This is not very strong in fertilizing element but in adding humus, loosening the soil and fostering the water content, is certainly a wise practice.

In all this, however, we have neglected the phosphoric acid. True, there is a little in our stable fertilizer and there is some deep in the soil which our deep rooting legumes will liberate. Yet there is a scarcity of this valuable element in our soils. Dr. Hilgard has always stoutly maintained that phosphoric acid will be the first fertilizer that the orchardist will need to add to his soil. As I have before stated, treated bone meal or bone superphosphate is perhaps the best form in which to apply this valuable fertilizer. This is readily soluble in ordinary water and thus is quickly diffused in the soil though it reverts so readily that it is rarely washed out and wasted. I think it is unwise to use raw bone meal as that is so inert that it waits long in the soil before it does much of any good.

The next question that is usually asked is "What is the best time to apply this phosphate?" It is certainly a good time at this season of the year. There would be no better time except that it is, perhaps, at this season not easy to get it deeply into the soil. It might be applied later or in early winter after the first rains and then plowed deeply under when it will be placed just where the rootlets can seek it out and profit by its presence. I cannot see how it would be any great mistake to drill it in at this season, for it would be plowed deeply under as soon as the ground was plowed after the first rain. Indeed I take it that it would be no mistake to add phosphoric acid to our soils at any season of the year, except from the fact that we usually plow only in winter and it certainly is wise to place our phosphate away down where the feeding roots can readily lay hold of it.

STRAPPING THE COW.

Any one who knows my habit knows that I never advocate stooling the cow so no one would ever think that I would ever advise strapping her. Nor would I ever countenance for a moment the using of the strap as a cat-o-nine-tails in the cow stall. But I have taken a deal of comfort in strapping the two hind legs together before I milk my cow. The nervous uplifting of the leg which has long bothered me and which I have suspected for a long time was only nervousness, has entirely ceased. Indeed now she never attempts to lift her foot at all. So that even if I neglect to adjust the strap before milking, it now makes no difference. She seems cured of the habit. This is certainly an easy way to do away with a very provoking habit on the part of some cows. My cow never kicked but only gave a quick nervous twitch of the leg which always kept me on the alert lest the milk be spilled. Of course a careful use of the left arm always prevented this last catastrophe.

GYPSUM IN OUR ORCHARDS.

I have a lengthy communication from Mr. Routhwaite, Arlington Heights, Riverside, on the subject of applying gypsum as a fertilizer. Mr. R.'s trees have been set twelve years on a stiff clay soil with a few places showing a hardpan. The orchard has had good care up to the present time. Commercial fertilizer has been applied in January, March and August, the fertilizer being high grade in phosphoric acid and potash, but low in nitrogen. Last spring it received a light dressing of stable fertilizer. He has applied a good dressing of mixed cow and horse manure in every other space between the trees and has grown cow peas in the remaining spaces. Before plowing down the manure and peas which he intends to do in December and January, he proposes to apply at the rate of 800 pounds per acre with the manure, fine bone meal and with the peas gypsum. Will gypsum hasten or retard the decomposition of the peas, and will it have any tendency to start trees to premature growth in the spring under ordinary conditions of weather? Gypsum has never yet been applied to the soil except as a filler to commercial fertilizers. If the soil is broken up where there are streaks of hardpan to a depth of two feet by the use of dynamite, would applying gypsum to these places tend to prevent the reformation of hard pan? Straw and coarse litter will be put in these holes.

From Mr. R.'s description, I think the orchard has been well cared for. I doubt if there is any need of commercial fertilizer as such land is usually very rich in the fertilizing element. I should suppose humus was the great desideratum. This will be secured in the green crop plowed under and in the stable fertilizer. These applications will also give nitrogen, which is probably also necessary. Undoubtedly the application of phosphoric acid is wise. As suggested above in another paragraph, I should use treated bone meal rather than raw meal. I doubt very much whether any good results will come from the application of gypsum. I cannot see how gypsum can do any appreciable good in our orchards. There is plenty of lime in our soils and I presume there is no black alkali. Of course in making stable fertilizer of horse manure, adding gypsum prevents the escape of ammonia and is always in order, unless one does as I do, scatter the horse droppings so that they at once dry out, in which case I think the loss is entirely insignificent. I wonder if Mr. R. was wise in using cow peas. These are really beans and so are likely to be injured by frost. Again, do we know that the specific bacillus that domiciles on the roots of cow peas is in our soil? This fact can easily be ascertained by examining the roots and seeing if they are well covered with tubercles. As I have been teaching for the last ten years here in Southern California I do not believe there is a better green fertilizer for orchard use than a good, vigorous variety of field peas. I believe the Canadian field pea stands well in the lead. I should have planted peas.

Coast News and Notes

By R. A. Dague, Cor. Sutter and Sansome St., San Francisco

HORTICULTURE.

Dried apricots have fallen from 10 to 8 cents per pound and sales are slow.

The J. K. Armsby packing house, at Tulare, is packing from 45 to 55 tons of raisins per day.

A rancher says every blackbird is worth $5.00 to the fruit grower as a pest destroyer.

Tulare county sent the first car load of oranges to the eastern market this season.

John Cnopius & Son, of Sonoma county, have made twenty-five different shipments of dried apples to Hamburg.

A few years ago apricot and peach pits were thrown away as valueless. Now they sell at $25.00 per ton. The shell is broken and the meat marketed.

Seven hundred carloads of apples have this season, so far, been shipped from Watsonville. Last year at an even date but 521 carloads had gone out.

Elwood Cooper, of Santa Barbara, has been appointed government inspector of imported goods, as well as to investigate the matter of misbranded fruits.

Prof. E. J. Wickson says the accepted way to treat chestnuts so that they will not become flinty and tasteless, is to plunge them into scalding water as soon as they are gathered.

San Francisco capitalists have purchased a block of ground in Oakland and will proceed to erect thereon a fruit cannery at a cost of $400,000. It will be ready for business next year.

State Entomologist, John B. Smith, of New Jersey, reports that the Chinese lady bug—Chilocorus similis—recently put to work in Atlantic county, that State, has done splendid work on the San Jose scale.

There are about 7500 acres of olive orchards, bearing, in Southern California, not counting San Diego and Santa Barbara counties. The olive men estimate the crop, this season, at 5000 tons.

H. Ruschaupt, near Dinuba, has 20 acres of Zinfandel vines 2½ years old. They yielded him, this season, 110 tons of grapes, and at least twenty tons more went to waste before they could be gathered.

The fruit distributors have sent east at this writing, over 7144 cars of fruit worth about $8,000,000. Of this amount the Sacramento Union claims 90 per cent of it was raised within fifty miles of that city.

Apples below 2¼ inches in diameter are rejected by the packers, says the Lompoc Record. This leaves 200 or 300 tons of fruit to go to waste. The farmers should dry this fruit, or establish a co-operative evaporator as was done at Watsonville.

American fruit is going to foreign markets at a satisfactory rate. One week recently the sales in London amounted to 27,000 boxes or 675,000 pounds of fruit, nearly all of it from California. This year France and England have poor crops of fruit.

Last year Peter Scazighini's raisin vineyard, near Grangeville, Kings county, yielded thirty tons of cured raisins; and this year 26 tons, from eleven acres. The average price he received was $85 per ton. His is the oldest raisin vineyard in Kings county.

Citrus fruit shipments in the year 1903 exceeded all past records in Southern California. During the year, ending October 31, the total shipments were 19,675 carloads of oranges and 2750 of lemons; total, 22,245 cars. The value of the fruit was $10,-314,455.

Horticultural Commissioner J. P. Kelly, of Alameda county, says just now large quantities of limes and lemons are being shipped into this state from Mexico, and that nearly all of them are infected with red scale, and he fears California plant life will be injured by it.

G. B. Katzenstein, manager of the Earl Fruit Company, recently said, "speaking of the summer's work in exporting fruits, it has been a success. The weekly shipments across the Atlantic have been about one hundred car loads. It would surprise some to know the number of letters received from France, Germany, Belgium and Italy asking for California fruits.

Simon W. Hanauer, U. S. Consul at Frankfort, Germany, says that the fruits sent there from this country are not as high grade as the Metz and other German brands. He advises the exporting of better fruit, and adds that the best way to send preserved fruits is to put up in glass jars or tin cans with labels in the German language, explaining just how the fruit is to be served.

AGRICULTURE.

An ordinary freight car carries from 20 to 25 tons of grapes.

The fourth crop of hay this year has been harvested in Tulare county.

The bean crop in the San Joaquin valley is 5000 tons below the usual yield, this season.

The onion crop of the San Joaquin valley this season, is 250,000 sacks. There were 2500 acres planted.

The daily consumption of potatoes in California and Arizona is estimated to be 12,000 sacks.

The almond crop in France is light. The total crop is estimated at 5000 bales, as against 35,000 in good years.

Richard Clayton, of Wooden Valley, this year raised seventy tons of grapes from a five-acre patch of vineyard.

The potato crop of the San Joaquin valley is 20 per cent less than last year. The river and island output is estimated at 1,850,000 sacks.

There are twenty large wineries in Fresno county. The output of wine annually is worth $1,500,000 and of brandy $350,000.

The net value of the grape crop in Fresno county annually is about $2,-500,000. Cost of production, $25.00 per acre. Gross returns per acre about $125.

Farmers can procure samples of garden seeds and farmers' bulletins by addressing your member of congress.

The movement of grape growers at Geyserville to organize a co-operative winery is gaining strength and bids fair to succeed.

The Chino Land and Water Company has purchased a 60-horse-power traction engine to be used in farming their land.

Parties at Red Bluff are negotiating for 200 acres of land in that vicinity on which they will plant Tokay grapes, Partlett pears and Smyrna figs.

Nearly all of the Ukiah valley hops have been sold. A total of 2477 bales were recently disposed of. The prices paid were 19½ and 20 cents.

E. W. Churchill has finished crushing his grapes at Oakville. He got 103,000 gallons of wine—an increase of 23,000 gallons over his last year's vintage.

Nurserymen report to the Cultivator that indications are that a large acreage will be planted, in Central California, to trees and vines the coming season.

The report of the Oxnard beet sugar factory has been made public for the season; 162,000 tons of beets were used. There was paid to the farmers $800,000. As there were 17,500 acres of beets planted, the proceeds of the farmer would average about $46.00 per acre.

Abner Fraser, of Tulare county, got this year, 930 gallons of honey from 90 stands of bees. It was a fine white grade and sold at the top of the market.

Up to the middle of October the total importation of Almeria grapes was 185,623 barrels, the size of the ordinary pork barrel. The grapes were packed in cork dust.

The California fruit distributors, up to October 28, had shipped to the Eastern markets 7144 carloads of fruit, At the same date last year the shipments were 6887.

Coast News and Notes

CONTINUED

There is a lively fight going on in Santa Clara county, between prune growers and jobbers, which threatens a panic in the fruit business there. The jobbers have industriously circulated the report that there is a great over-production of prunes. This the growers deny, and assert that a conspiracy exists among the buyers to force down the price. The growers are offered but 2¼ cents, and so far comparatively none have been sold at that price.

LIVE STOCK.

Petaluma has the largest chicken ranch in the world. Upon it are 13,000 laying hens.

A determined effort is to be made to secure the national convention of buttermakers for California in 1905.

Obispo county is taking steps to organize a Co-operative Poultry Association, patterned after that of Sonoma county.

A company has been organized at Red Bluff with a cash capital of $25,000 for the purpose of erecting an extensive dairy plant near that town.

On an average one carload of poultry arrived every day all last week, in San Francisco, from Nebraska. The freight charges on those chickens were $300 per car.

All the cows in the dairy of the Ukiah State Hospital have been killed. An examination showed that they all had tuberculosis of lungs, liver and udder.

Within a few months, a plague of chicken cholera killed thousands of chickens in Marin county. The one ranch where it originated lost in a short time 2700 fowls. Professor Ward, vetrinarian of the State University, visited the locality and studied the disease. His treatment has completely stamped out the trouble.

MISCELLANEOUS.

"The Southern Pacific and Santa Fe have renewed their orange shipping combine for the season," says the San Francisco Examiner. The Santa Fe owns 4300 refrigerator cars and has cut loose from the Armour line. The Southern Pacific has arranged with Armour to use 5000 of their cars. The orange growers are to have no voice in routing these cars east. The suit pending between shippers and railroads is tied up for a year in the Federal courts. It is estimated that 25,000 carloads of oranges and lemons will be shipped, the total value of which will be $17,500,000. The railroads will get for shipping $300 per car, or a total of $7,500,000.

A large tract of land has been purchased in Butte county by the Sacramento Valley Land Company for $65,000. It is to be irrigated and put on the market. Neighboring formers are organizing a co-operative company to utilize water furnished by the land company.

Twenty citrus growers of the Lindsay district decided, at a late meeting, that crop picking should be paid for, hereafter, by the hour and a committee was appointed to fix the price of labor. A movement will be made to induce other growers to adopt this plan.

Reports have been submitted to President Ripley of the Santa Fe, in which it is estimated that during the new season just opening, there will be sent East from Southern California, 1500 car loads of celery, 3000 cars of lemons and 25,000 cars of oranges.

There had been a run of 201 days of fine dry weather at San Francisco, when a light shower came November 4th.

The Board of Supervisors of Siskiyou county, has purchased a large farm on which the indigent will be kept, and the able bodied put to work; the proceeds will go to the benefit of the farm and other county institutions.

The Commissioners of Education say the total number of pupils enrolled in the common schools of the United States is 15,925,887. The average daily attendance last year was 10,007,273.

The coinage in October at the San Francisco mint, was as follows: Eagles, $765,000; half eagles, $655,000; dollars, $232,000; half dollars, $24,000; quarter dollars, $84,000. Total, $1,760,000. Philippine pesos, $1,425,060.

Prof. Fowler, assisted by Prof. Clark, Prof. Woodworth and Miss Woodworth of the State University, conducted a very interesting Farmers' Institute at Geyserville last week.

Arthur C. Jackson, president of the Alaska Geological Society, says that Alaska has the grandest scenery in the world and resources sufficient to support 10,000,000 people.

Chicken yards consisting of 60 acres are being fenced off at St. Martin station on the Southern Pacific railroad and the poultry business will be extensively engaged in.

The natural gas well at Ventura is now yielding 30,000 feet of good gas every twenty-four hours. This is 10,000 feet more than enough to supply the city.

An election is to be called, in Fresno, at which the proposition will be submitted: Shall the city purchase the waterworks at their appraised value, $330,000?

The United States government has commenced the work of irrigating 2,000,000 acres of land in Central Washington from the Spokane river.

There are now enrolled in the University of California 2822 students, 32 of whom are taking courses in agriculture and dairying.

The Santa Fe railroad is expending $2,000,000 in filling low ground in San Francisco, preparatory to establishing extensive railroad yards.

November 11th was "Squirrel Day" in Tulare county. Men and boys waged a war of extermination against the pests, with guns and poison.

The Ellsworth drier of Niles has finished the season's work. So far they have shipped 685 tons or 48 carloads of dried fruit and nuts.

Walnuts at Niles, and San Jose, and other Central California points, are quoted at 10 cents, but growers generally refuse to sell at that price.

The late rains were welcomed in Central and Northern California, the crops having been gathered.

Lou Dillon, the Santa Rosa trotter, will be brought to California for the winter.

Almonds at Niles are selling at from 7 to 10 cents.

The season for killing deer expired October 31.

The wool market in San Francisco is dull.

Stockton is to have a starch factory.

WEATHER AND CROPS.

Alexander G. McAdie reports that the temperature during the week was nearly normal, but cooler weather prevailed at the close and light frosts occurred in some sections. Rain fell in nearly all parts of the state except Southern California, and heavy fogs were frequent in the coast districts.

The rain in some sections was sufficient to start grass and soften the soil for plowing, but was generally too light to be of material benefit in the central and southern districts. Late grapes and unprotected raisins were slightly damaged. Grape shipments continue and wineries are finishing up the season's run. Raisins and dried fruits are practically all sheltered. Canneries are still in operation in some sections. Walnut harvest continues, and a good crop is reported in Ventura county; the nuts are of excellent quality in all districts. Olives are in good condition. Orange shipments are in progress in Oroville and Porterville districts, where the yield is reported excellent; Southern California oranges are coloring and prospects are good for a heavy crop. Table grapes of superior quality are abundant in local markets.

Corn picking and potato digging continue and fair crops are being harvested. All other crops are under cover. Plowing has been resumed in many places since the rain and some farmers are seeding, but more rain is needed to make work profitable. Feed is scarce, but cattle are in fair condition. In Southern California no rains have fallen. Oranges are excellent.

The poultry people of Southern California will bear in mind that the famous Midland Poultry Food may be had in any quantity of Henry Albers, the "Largest Exclusive Poultry Supply House on Earth" at Los Angeles. Car load lots are received and distributed from main points in the state. But the house in Southern California which acts as distributor is that of Henry Albers. Besides the Midland foods there is everything in poultry lines. The specialty of this house is the Los Angeles Incubator. Its an old favorite and a reliable machine.

BERRY PLANTS

Logans and Gray's Gardena Dewberries specialties. These Dewberries have produced over 5 tons of fruit on one-half acre.

C. H. SESSIONS, ASSOCIATE EDITOR

BUTTER-MAKING AND BUTTER-MAKER.

The subject of this true story had been making butter for over 18 years; not all this time in the little village of B——, but he had been in the latter place eleven years, and had tried to perform his work in a satisfactory manner. The B—— factory had never paid fancy wages, like some of the factories he had read about, but what could he expect? His butter had never won the grand sweepstakes at a National convention, nor had it even carried away the high score at a state convention or state fair. In the little left-hand drawer of the bookcase at home were a number of letters from people who had received his butter during all these years, and in every one of them they praised the butter up and informed him that it always commanded the highest price. But still he was not known over the dairy world like some of the fellows he read of in his dairy paper, and how should he expect a big salary with only letters in the drawer to show that he had been a faithful servant? His bank account, in consequence of his not being known and getting a big salary, was very small, for he had not been able to accumulate very much of this world's goods. For some reason or other the month's salary went very fast after the 20th of each month, the usual pay-day; most of it went to pay little debts contracted the month previous.

There were only three children in the family. There had been another, a little golden-haired fellow, who used to come down to the factory and with those big blue eyes watch the big churn go round, but one day he failed to meet his papa, and the next—well, it is the old story—a little vacant trundle bed—and a few more sorrowful lines in the father's and mother's faces. To the other three he was trying to give an education so that they would be able to take care of themselves—and perhaps their mother also, and as all of these things cost money, it was very easy to get rid of the dollars, as so many of us have found out ere this.

Things had not been going just as smoothly in the factory as they had in the past. There was something wrong, but his wife said he just imagined it. But no; he knew the patrons, especially those who were directors, had been noticed talking together out in the yard in low tones, and this was something that had never been known before, for the butter-maker had always been taken into their confidence. Perhaps he did imagine that something was wrong. At any rate, he would lay it to his imaginations.

He could not think of anything he had done to cause the directors to consult with one another without telling him what the trouble was. He was making just as good butter and just as much of it as ever, only he had kept the helper longer this fall than ever before, for he did not seem to get through with his work quite as quickly as he used to; but then he was not quite so young and spry as he was once, and now occasionally a pain would catch him in the shoulder or arm. He knew this was the result of working in the wet so long, but he paid very little attention to it, for he expected to make butter very many years yet.

A few weeks passed along and the annual meeting came and the directors met in the little office in the corner of the factory, as they had many times before. The butter-maker had got all the work done, and had taken his day-book in to them to look over, just the same as he had every month for 11 years, and was turning to go out when the president asked him to wait a few minutes. He sat until one of the directors rose to his feet and in a very neat speech told the poor butter-maker that they had decided that a younger man would be better for them; that he, the butter-maker, was getting old, as he probably realized, and that the directors had concluded that they could not afford to hire a second hand; and while they regretted to part with him, still, for the good of the factory, they must do it. He was told that his resignation would be accepted at any time to suit his convenience. They voted him a fine recommend and hoped he would find a good situation where the work would not be so hard.

The butter-maker sat as one stunned. He could not say anything, for the seemed to feel a choking sensation in his throat; the announcement had come like a thunderbolt to him. At last he rose, and, saying good day to the board, he went out—to the engine room to think it over. Poor foolish fellow! He had never realized that he was getting old; that the hairs in his head were nearly as gray as his good wife's and to tell him bluntly that he was too old to continue to work for them, after he had given them the best eleven years of his life, was very cruel on their part.

The hardest part of it, however, was to come yet, and that was to go home and tell his wife all about it. It would be hard to leave the little village where they were so loved and respected by all the people, and besides, the little grave over in the corner of the churchyard would be negelected after they had moved away.

Some way he got home and told his wife about it, and after they had talk it over they felt better. We have all had this same experience. With her help and wise advice he commenced his plan to move.

It was only a few days when the news got out that the butter-maker had been discharged, and then such a wave of indignation went through that Christian community that a meeting of the shareholders was called and a petition was circulated to reinstate the old, gray-haired butter-maker and to give him a helper all winter, and it is needless to say that it went through and the faithful butter-maker and his kind wife are still where they can plant a few flowers on the little mound and attend the same little church by the side of it, and all because the patrons of that factory were Christian men and women, and loved justice and did not believe in wronging one of their fellow citizens. —C. F. Leighton.

MILK AND BRAIN POWER.

At a public meeting held at Palo Alto, seat of Stanford University, to discuss the movement to establish a sanitary dairy on a co-operative basis as a means of securing pure milk for the town, I. P. Roberts of Cornell University, one of the most noted authorities on agricultural affairs in the country, was present and delivered an address on the relation of food to mankind. The address was very interesting, acording to the synopsis given by the Palo Alto Times, from which the following is taken: He spoke of the effect of food upon civilization, showing that those nations which used the most concentrated foods, which give a reserve of mental power, have attained the highest civilization. The Americans lead the world because they use more milk, butter, sugar, fruit and wheaten bread than any other nations. The Turk, for instance, uses only one-tenth of the sugar and one-fortieth of the butter that Americans use. No savage or barbarian people can be civilized until their food is improved. Neither can breeds of animals be improved without care in the food used.

Milk and butter are the most perfect foods, giving, in concentrated forms that are easy of digestion, all the elements needed. Butter, he said, is concentrated sunshine, and sunshine stimulates, as may be shown by the superior physical appearance of Californians.

Dr. Roberts showed plainly the necessity for the use of milk as food, and for the utmost care in producing and dispensing the milk.

He spoke of the difficulty and danger that had arisen at Ithaca through an epidemic of typhoid. The prosperity of Ithaca depends upon Cornell, and if students fail to enter the university the town is injured financially. The prosperity of Palo Alto was closely linked with Stanford, and if conditions should arise to keep students away property values would be decreased, and the town would retrograde. It was therefore important to use the utmost care to prevent unsanitary conditions. —Dairy and Produce Review.

If you are thinking of buying a separator, don't fail to write our advertisers and ask them for catalogues. You can obtain lots of information from those publications.

Bran and corn meal, if fed too freely to cows, have a tendency to fatten them and injure their capacity for giving milk. If corn must be fed to the milk cows, give in connection with wheat bran, ground oats, etc.

IT ALWAYS PAYS.

A stock raiser asked the editor of this paper, the other day, "Will it pay me to invest in a pure blood bull and a few pure blood heifers?"

Our answer was a prompt and emphatic, "Yes." However, this will not do under all circumstances and the answer depends on what kind of a person it is who contemplates buying pure bred stock. The editor of this paper has been a breeder of pure bred Herefords for many years and can speak from experience. Every man is not qualified to raise high class cattle, and success in stock raising depends as much, or more, in the man than in the breed sought to be raised.

If you are going to raise high class dairy cattle, you must give them high class attention; you cannot let them hustle for themselves like you can scrubs. If you do, you will surely come to grief and perhaps the conclusion that pure bred stock is inferior to scrub cattle. While this would be an erroneous conclusion to arrive at, it would no doubt be a logical one under the conditions of management. If, on the other hand, you are a good cattleman, willing and able to take proper care of your stock, put brains into your business, and study your animals every day of your life, so that you may know every individual cow then feed her to her utmost capacity, but nerve overfeed her, never let her suffer from the effects of weather, and you have a good eye for business, for advertising your dairy product and your stock and let the people know that you have something superior, then we say, by all means it will pay you to raise pure bred stock.

There is one thing, however, that the Cultivator can recommend: the keeping of a pure blood sire. Any cattleman with common sense can keep a bull and keep him right. The article we printed recently in this paper on "How to Care for the Bull," ought to be read and reread by every dairyman in California, and then, when thoroughly understood, the rules laid down in that article should be followed to the letter.

As a general proposition we say, it will pay every cattle raiser to use pure bred sires; they improve the herd, bring up the average price of each calf and, in time, raise the owner in public estimation—for we all have respect for a cattleman who has a fine breed of any class of cattle. It must be remembered, however, that pure bred animals, to get the best out of them, must be better cared for than the average farmer cares for his cows.

To keep your herd up you must earnestly be weeding out the poorest, just as you constantly select the best corn in your field for seed the next year to keep up the standard. All the best breeds of cattle today before the country have been brought to their excellence by the study, painstaking care and patience of men who were interested in high class breeding for results. This is as true of beef cattle as of dairy, and it is just as true that results show in breeding beef cattle as in dairy. So we say buy pure bred bulls, whatever else you do, for "as you sow, so shall you reap." As you breed so shall you get results. This is true in the hog line too, just as true as it is in cattle raising. A good boar will pay his purchase price the first litter. Here let us quote the advice of the editor of the Des Moines Tribune, himself a practical farmer. He says:

"Procure a good registered boar of good individual merit and breed him to your best brood sows. Select the breed that suits your fancy best, and stick to them. The best is none too good in any line, but what we want to impress upon our readers, is that the best, to do their best, should have the best of care. If you are going to give only "scrub" care to your live stock, scrub animals can stand more of it than choice pure bred animals."

As said above this rule is as valuable when applied to cattle as to hogs.

HOW GERMS GET INTO MILK.

From Bulletin No. 152 of the New Jersey Experiment Station, U. S. A., we take the following extract:

"In the first place, a good many germs are living in the milk while it is yet in the udder of the cow, and in the next place, a good many more fall into the milk from those floating in the air, being caught in the streams of descending milk. Still others are introduced clinging to the particles of dust, dirt, hair, chaff, etc., that become loosened from the udder and adjacent surface of the cow, and from the hands, arms, etc., of the milker, and from the whisking tail of the animal. It is the presence of numerous particles of this sort which is responsible for the general practice of straining milk. But no strainer is fine enough to retain the smallest particles, and least of all, the germs that have been washed out of the particles. In those dairies where the practice of keeping cows and stalls thoroughly clean has not been adopted, the dirt that most frequently gets into milk consists of particles of manure. The presence of even a little manure imparts to the milk the pecular flavor called 'cowey,' as though it were the distinctive odour of this domestic species. But this flavour is quite distinct from the odour of new, pure milk (also found in the cow's breath, over which poets have raved in ecstacy). In these days of 'modern dairy progress,' the production of 'cowey' milk is both inexcusable and reprehensible. Milk has a strong attraction for odours and readily absorbs any predominant odour of the air, etc., it is in contact with, hence it is not strange it extracts the odour of the dirt that falls into it. In fact, if the milch cow's food has any peculiar flavour it affects the milk. These various disagreeable flavours in milk are of less consequence than the fact that milk receives the germs that inhabit the dirt which gets into it. Of all dirt, manure is the richest in germ content, and what is even more important, it contains germs that are parasitic in the intestines and hence are liable to produce disease."

GOATS AT THE WORLD'S FAIR.

Chief F. D. Coburn of the World's Fair Department of Live Stock has received an application from John W. Fulton, Secretary of the American Angora Goat Breeders' Association, for a date for a public sale of Angoras under the auspices of that association, during the period of the display of goats at the Louisiana Purchase Exposition. The World's Fair classification gives the Angora goat much larger recognition than has been accorded to it at any previous show, allotting to the breed $3,410 for 133 cash prizes. It is possible for a single buck to win $230, and to aid in winning $320 additional, of Exposition money, together with diplomas, special prizes, etc.

The condition in which butter is sent to market often determines the question of profit, or loss. Although, sometimes it may be of inferior quality yet if put up in nice shape it will be acceptable to the dealer and usually to the customer.

DRYING OFF COWS.

In the current number of Up-to-Date Farming, a writer discusses the difficult question of drying off the dairy cow. The method suggested possesses much good sense and the advice given is practical. It is the practice in the main we have followed for a good many years with excellent results and the Cultivator would recommend a careful reading of the article here quoted:

"In well-regulated dairies, each cow is milked 10 months of the year; the remainder of the year she is said to be "dry." When the dairy man supplies milk to customers he endeavors to have a small part of the herd dry at a time, so there will always be enough cows to supply his trade. An incidental advantage of this is, the milk from fresh cows is added to that from those more advanced in the milking period and the changes due to the change of lactation are avoided in the mixed milk which is thus kept of uniform quality. As the period of lactation progresses there is a tendency to gradually increase in the total solids. At the New York station the yield was found to decrease quite steadily from the time the cow is fresh, to about the middle of the lacteral period, after which it is quite constant. This shrinkage in the yield was accompanied by an increase in the percentage of fat, and the physical condition of the milk was so altered that the cream rose less easily.

Discard every cow that goes dry on her own notion. While she should be dry six or eight weeks previous to calving, she should be forced dry. She ought to be giving at least 16 pounds per day when you start in to dry her up.

Ten weeks before calving cut off all grain from the cow and if in winter, also silage; after a week of this treatment milk her once a day and another week every other day. Then stop short; you must stop sometime, for if you continue to milk, the cow is bound to respond. Sometimes two or three days after stopping if you find the udder caking, milk out a little to ease it up, but generally this does not happen.

At six weeks to calving, she should be thoroughly dry. The trouble is with most farmers they continue to milk the cow regularly until within four weeks of calving; at that time the cow has begun to freshen, and if they stop then, trouble ensues from the new milk forming and the udder is likely to be spoiled. If the cow is not dry for four weeks before calving, better keep on milking the rest of the period. I am satisfied you can get more pounds of milk from a cow by milking her 10 months in a year, than by milking her 12.

Remember, if the cow continues to secrete milk it must be drawn. None should be forced to "go dry" against manifestly natural resistance to so doing."

The Santa Fe announces that as soon as the 250 mile cut-off is finished near Belen, N. M., they will run trains from San Francisco to Chicago in 2½ days.

KINDNESS TO THE HORSE.

Says a writer in the Farm Journal:

"My horse knows me as far as it can see me, and as I leave the wagon will look after me and watch for my re-appearance; then, if I wave my hand will come to me. Will your's do that?"

Right in that short paragraph lies a principle—the principle of kindness.

That principle is a harbor of safety for some men. Others avoid it and wreck their fortunes on the rocks of unkindness and spiteful usage. A boy once said to us:

"Father always speaks to the horses, the dog and me as if he couldn't bear to have us round."

Think how much that man missed in the kindly loyalty of boy, horse and dog.

What is the matter with some men on the farm? They strike and scold cattle and horses and boys and everything else that dare not strike and talk back. And yet they are not unkind men at heart. Let a neighbor be in distress and they will do anything to relieve him.

They have got in the habit of loud speech and rough usage. It is costing them money every day, but they don't see it.

Think how many weary steps that man whose words serve as our text, saved in catching his horse in pasture. Then, besides, does anyone think the animal did any less work for loving his master as he did?

It is of especial importance that we deal kindly and gently with the cow if we expect the best possible profit from her service. The shrewd, far-seeing dairyman studies how to promote the comfort and contentment of his cows. "He knows where his bread is buttered." He keeps his mind alert to know what cow comfort is. For this reason he is gentle, quiet and patient, even with a fractious, ill-tempered cow. He banishes the cramped, confining stanchion; the deep and dangerous manure gutter; the crowding of cows uncomfortably and unhealthfully together in the stable. He has clear convictions as to what constitutes a well lighted, well ventilated, clean, healthful stable room.

Through all his management runs this principle of kindness, not only because it is the humane thing to do, but also because it pays.

In no other way can the boys, the hired men, the cows, the horses and all the animals or life of the farm be made to feel contented and happy on that farm. Every owner and manager of a farm should remember always, that he is the prime source from whence proceeds the spirit and atmosphere of that farm. He is to decide whether it shall be a genial, kindly farm life or not. And in no other way can it prove a truly successful, happy farm life for him and all concerned.

HOG NOTES.

Proper sanitary conditions about the swine pens and yards are the best preventative against hog cholera and diseases incident to hogs.

Young pigs should be kept growing and making bone and muscle. If this is done, fat can easily be placed on them at a profit most any time.

The stunted pig is a losing proposition nine times out of ten. A little care with the young pig in the beginning will save dollars in the end.

It is quite an item to commence feeding pigs early, in order to have them well accustomed to eating before cold weather sets in. When the sows are fed on slops in a sunny trough, pigs will often commence eating when three weeks old, and with a little care to supply them with mill feed worked into a slop with sweet milk, they can be kept growing steadily and may be weaned without any check in growth.

THE CARE OF CALVES.

One of the most serious faults of the average American farmer is his lack of knowledge and determined purpose in the care of young stock, writes a specialist in Hoard's Dairyman. We judge of a man's understanding of any question by the way he does his work. Look over the calves at three, six or twelve months of age in nine out of ten of our American farms. Note their unthrifty, scrawny, ill-fed looks, and then judge what must be the real knowledge possessed by their owners. Some will say that the owners of these calves do not do half as well as they know. In our opinion that is not the fact. The real difficulty is that they do not half know what they ought to know about these things and consequently their work is half done. They have never resolutely set themselves to study what it means to rear a calf well. When a man is thoroughly saturated with the knowledge of a thing it holds him up to better work.

In March last two men came into this neighborhood looking for grade dairy calves, says a correspondent of Hoard's Dairyman. They were the men who knew what they wanted. They purchased seven grade Guernsey heifers, dropped last fall, of one man and paid him an average of $24.28 for the lot. At the same time they said they could purchase calves of the same breeding and age of neighboring farmers for from $10 to $15 apiece.

What made the difference in price? Simply the way the calves were handled. The seven calves were handled as follows:

1. They were kept dry and clean with plenty of fresh dry bedding every day and their quarters were kept well disinfected.

2. They were fed skim milk, fresh from the separator, after the first ten days, with a little ground flaxseed and blood meal added.

When the milk was fed they were put in stanchions and the milk set before them in pails. Afterward they were given a small feed of oats, followed by alfalfa hay. But the great care was to keep them dry and clean. As soon as they were through eating their oats they were let out of their stanchions and ran together loose in the compartment. They were fed milk morning and evening. When sold they were in fine, clean, thrifty condition, but not fat. They consumed apiece in the six months they were kept about 3500 pounds of skim milk, $1 worth of oats, $2 worth of alfalfa hay and flaxseed meal and 50 cents' worth of blood meal.

After paying for the oats, hay, flaxseed meal and blood meal, $3.50, and allowing $3 for the value of the calf when a week old, the price allowed by calf buyers—we have $17.78 per calf as pay for 3500 pounds of skim milk and the labor.

Hoard's Dairyman, a very able paper devoted to the live stock interest in all its phases, prints, in full, with fine illustrations of her barn, Mrs. Minnie E. Sherman's article on "The Dairy Cow" read at the Seaside Institute. The paper was one of the strongest read at the Institute and has been published in full in the Cultivator.

WORLD'S FAIR POULTRY SUPERINTENDENT.

T. E. Orr, Secretary and Treasurer of the American Poultry Association, has been appointed superintendent of Poultry at the Louisiana Purchase Exposition under Chief F. D. Coburn of the Department of Live Stock. Mr Orr has already begun active work, and will devote considerable time during the winter at poultry shows and meetings and elsewhere among leading fanciers in behalf of the World's Fair poultry show.

Poultry, pigeons and pet stock are placed in Division "E" in the World's Fair classification and have been allotted over $16,000 for cash prizes. The dates for these shows are October 24 to November 5, 1904.

AMERICAN POULTRY INTERESTS.

In a recent communication to the members of the American Poultry Association Mr. T. E. Orr, secretary, gave some very interesting suggestions, among which were the following:

Talk to the chairman of your local farmers' institute and urge that the subject of poultry be given proper recognition on the program. Help him to provide good speakers. Consult your State Secretary of Agriculture with a view to having able poultry speakers sent out to the various sections of the state. Urge the directors of your State Experiment Station to give as much attention to poultry as is given to many less important subjects.

Another suggestion is that specialty clubs reinforce the regular cash premiums on poultry at the St. Louis World's Fair with liberal club specials, either in cash, medals, cups, diplomas or badges.

The secretary says the new Illustrated Standard will not be ready before August 1, 1904, and that the Standard of 1903 "is the law of poultry down until the new one is published."

In closing his circular the secretary calls to mind these facts:

1. That the poultry product surpasses every other agricultural product except corn.

2. That there is a constant demand at good prices for first-class poultry and fresh eggs. With us live hens brought 16 cents per pound in May, and we are now selling eggs at 24 cents per dozen wholesale.

3. That the general public needs more information on the subject of breeding, rearing, feeding, exhibiting and marketing poultry.

4. That fancy poultry interests and commercial poultry interests advance or decline together.

FOWLS FOR THE TABLE.

The Brahma has the frame and build for laying on large quantities of meat, but it is deficient on the breast, caused by the fact that it is bred to remain near the ground instead of flying. The Game, on the contrary, being a very active and vigorous bird, is well developed on the breast, and having small bones and large muscles, it is an excellent table fowl. The standard exhibition Games are not referred to here, although they are not entirely deficient but those Games bred exclusively for the pit. Being trained and developed for strength, those characteristics are inherent in their progeny, and render them an excellent breed of fowls.

When crossed on the Brahmas, they combine quality and size, and though not such high flyers as the pure breeds, they possess the good quqalities of the Games, with the weight of the Brahmas. In breeding for home use, these points should not be overlooked. Under no circumstances should quality be sacrificed.—Farm and Fireside.

Milk, when fed to hens, is more profitable than when fed to pigs; they never tire of it and it is relished by them in any form.

BREAKING UP BROODY HENS.

Ask an old farmer the best way to break up a broody hen, and ten to one he will tell you: "Shut them up and starve them, or duck them in cold water; throw them as far as you possibly can every time you come near the nest; tie a rag on their tails, or build a frame where they must stand on a roost, with no chance of setting down." A short time ago I heard a new way, and, as I have tried it and found it worked well, I will give it to your readers:

Remove your hen from the nest carefully—and here is a point which it is well to follow at all times: Always handle a hen as you would a child, with care and consideration, as they are tender things, and jerking affects their nervous system just as much as it would affect your child to grab it by the arms or legs and swing it over your head once in a while. That is something which many people, and even men and women who hvae made a study of the poultry business for many years, do not know, or else they do not care to know. But, to return to my subject: Take the hen carefully from the nest, place her in a comfortable place, but in altogether new surroundings, where there are no nests, and do not starve her by any means. On the contrary, feed her on all the rich, concentrated foods she will eat, and especially see that she has some kind of animal food—green cut bone is about the best for this. Be sure she has plenty of grit, some green food and water. Do not forget the last, as what we wish to do is to get this hen in laying condition again, and in order to do this she must have plenty of good food and water. Before long we find our setting hen has renewed her entire constitution; that old broody feeling passes away, and she feels like getting out and enjoying the air, and will soon be laying again.

The reason this process acts so well and so quickly is that a hen after laying a large number of eggs becomes worn out; her constitution has stood a heavy drain all winter, perhaps, and she feels a desire, a very natural desire, to sit, because it is the nature of the hen to sit and raise a brood of chicks at least once a year. By raising this brood she rests herself, and that is why she is usually in such good condition when winter comes. I have heard showmen say that they like to have their hens sit, as by doing this they rest up, and in the winter when the show season comes on, instead of having an old fagged out hen who has been forced to lay most all the year around, they have a hen that has had her natural rest, and she is in good condition to show. About this latter I am not much of an authority, but I do know that a hen can be broken from being broody by feeding carefully and changing her quarters. She will be laying quicker under this treatment than any other, and, in my mind at least, it is the best I have ever tried, and I have tried several other humane ways.—Patience, in the New York Tribune Farmer.

CHARCOAL FOR POULTRY.

Charcoal is used as a disinfectant and purifier in many ways, and as yet no substitute has been found for it. For poultry it is, while not strictly speaking a necessity, a specific for all forms of indigestion from which poultry, both old and young, so frequently suffer.

One of the best ways to supply it is in boxes, just as grit and oyster shells are supplied. Let it be good charcoal, such as used for a furnace, broken small but not crushed to powder. Set the box in a dry, clean place and let the fowls help themselves, as their natures demand.

Strange as it may seem, fowls are endowed with an instinct that enables them to take that which nature requires for their health—that is, provided they have access to it.

They will eat grit, oyster shells and charcoal just as needed, and no more. The grit will masticate their food, the oyster shell furnish the material for shells and the charcoal will aid the digestion and keep pure the contents of the crop.

E. B. Runyon is opening up a fine dairy farm near Hanford.

SHOEMAKER'S BOOK ON POULTRY

and ALMANAC for 1904

There is nothing in the world like it. It contains the following: 212 large pages, handsomely illustrated. A number of most beautifully colored plates, true to life. It tells all about all kinds of **Thoroughbred Fowls**, with life-like illustrations and prices of same. It tells how to raise poultry successfully and how to treat all diseases common among them. It gives working plans and illustrations of convenient Poultry Houses. It tells all about **INCUBATORS and BROODERS.** It gives full instructions for operating all kinds of Incubators. This chapter is marvelously complete and is worth dollars to anyone using an incubator. It gives descriptions and prices of Incubators, Brooders, and all kinds of Poultry Supplies. In fact, it is an encyclopedia of chickendom and will be mailed to anyone on receipt of only 15 cents. Your money refunded, if not pleased. Address

EXTENT OF THE INDUSTRY.

The production of poultry and eggs is an important item in rural income in every section of the country, but the facts brought out by the census of 1900 show that poultry enthusiasts have greatly exaggerated the relative importance of their specialty. Occasionally, paragraphs have gone the rounds of the press, comparing the annual value of poultry and egg products to that of wheat or cotton, and in extreme cases to annual sale of hogs. The census data show that while such comparisons are unwarranted, the total value of the poultry business reaches a sum that entitles it to rank high among the resources of the farm.

The total number of chickens in the country June 1, 1900, was reported at 233,598,085, against 258,871,125, ten years earlier. This comparison, however, is inaccurate in that the census of 1900 excluded from the enumeration chickens under three months old. a very ill conceived form of schedule in view of the fact that this age limit bars out the greater part of the spring crop. The production of eggs in the two census years furnishes a fair indication of the relative position of the industry, 819,722,916 dozen in 1890 and 1,293,819,186 dozen in 1900, an increase of 58 per cent in the decade. Part of this may be properly credited to improvement in breed and laying quality of fowls, but in the main it represents growth of the poultry industry. The total value of poultry on hand when the census was taken was $85,794,996, but the value of that raised during the year was $136,891,877, the amount sold or disposed of during twelve months largely exceeding the amount on hand at any one time. Taking this as representing the value of poultry sold or consumed during the year, together with $144,286,158, which represents the value of a year's production of eggs, we have a total of $281,178,035, representing the annual value of poultry and poultry products.

The poultry business is now just coming under the influence of the same conditions which have so radically revolutionized the meat industry in the last twenty-five years. Cold storage and refrigerator transportations are opening possibilities in poultry production and distribution that will tremendously increase the importance of the industry in the next decade. Under old conditions poultry consumed in any section of the country was of local production, as chickens bear long live shipment but poorly. With the application of refrigeration will come a change, both in production and distribution. Production, instead of being confined to localities in ready touch with markets, will concentrate in the districts where poultry can be produced most cheaply. In other words the center of production, as in the case of beef, will be near the grain fields and especially in the corn belt. Another change will be in the direction of production on a large scale instead of chicken raising as a mere incident to farming. In the past chickens have either been shipped alive to market centers, to be killed just before being offered to the consumer, or killed on the farm and shipped to the commission man for immediate disposition. From an economic standpoint either method is wasteful. The by-products in the shape of feathers and offal are practically wasted.

Chicken slaughter on a large scale is already practiced at western points like Chicago, Omaha and Kansas City, where Armour and Swift and other great meat-packers are engaging in the business, with their wealth of money, experience and facilities for distribution. On the scale on which these operations are conducted, the chances for economy in utilization of by-products are so great that these operators can offer prices for chickens which cannot be met by local buyers or commission shippers, and this class of poultry handlers are destined to pass out of existence, just as the local butcher passed away, and for the same reason—inability of the small operator to equal the large in economies of production. These big concerns have regular routes over which chicken cars are run at stated intervals, gathering up fowls from local buyers. The slaughter is continuous, without regard to immediate market demands, the surplus being stored in refrigeration to be drawn against at those seasons when the supply of live fowls is small. This tends to equalize conditions throughout the whole year, avoiding the succeeding periods of glut and scarcity that alternately followed each other under old conditions.

This new branch of the packing industry will furnish, as in the case of cattle, a steady market for all grades of poultry in any quantity and at all times, and the result will be that poultry-raising in the middle Mississippi and lower Missouri valleys will be carried on on such large scales as to make "Chicago" chicken as well known as "Chicago" beef in the dietary of America and Europe.—Country Gentleman.

QUALITY THAT COUNTS.

There are many qualifications that one may possess that really go for naught when calculated in the scales of value for or against better things. This is true to a large extent with our poultry of all kinds. Of what real value in the world of poultry is the pea fowl? It has beauty that attracts, its tail feathers may be made use of for decorations or for brushes; beyond that it is merely an ornament or curiosity. Within the year we have seen both young turkeys and the young of the pea fowl in the same brood attended by the mother turkey hen. We have also seen the pea hen with a brood of seven of her own young; her quality of being an ornament and a curioity was strong in this case simply because she had succeeded in having a few young of her kind.

The possession and exhibition of Game fowls is largely on the increase. We have seen more of them the past season at exhibitions than ever before. There are no better fowls for eggs and table purposes. Good specimens will always sell at money-making prices for the pit. Those who grow them of the best quality always make money from selling them, but the very qualifications that make them so valuable for the pit count against their being made use of to any extent as general purpose fowls. They are so very quarrelsome that few can be kept together. Their vicious nature prohibits their being kept with other fowls, their money value debars them from all utility uses and in fact isolates them from all other poultry. Where they are kept they must be separated almost like wild animals. Their qualities place them in a class by themselves; the very use to which they are put for profit places them under the ban of the law, and to take them about attracts suspicion. Such qualities as these prevent Games of all kinds from being generally popular.

The Indian Game is a modern improvement over the Pit Game. They are not so pugnacious; they may be kept together about as well as other fowls; the males are more quarrelsome than are others, but even they will grow together without continual warfare going on. They give fine table meat, but unlike the Pit Game they have the yellow skin, while the Pit Games generally have the pinkish-white skin that insures meat of the same color and of the finest quality. On the other hand, the Indian Game will rank with our American breeds, and while so much is written in their favor, they have no qualities that place them above our American fowls in any way. This in no way detracts from their value, for the American breeds rank high as table poultry all the world over. It is quite enough to be as good as they are.

The actual value of products must be decided in the open market, and a claim to unusual value that is not substantiated through this channel goes for nothing. If it can be shown that any one breed or variety has a demand in the meat or poultry stall above all the others, then a real value over all will be established. But so long as this is not the case, it is quite as well to take a position in line with other good ones and be content. We hear so much of the value of cross breeds for table purpose, but we are compelled to admit that we can select quite a number of regular breeds or their varieties that fully equal or excel any of the cross breeds we have ever seen. We have tried many of them; all the advantage we have seen in crossing is that in some instances the product of the first cross makes a quicker and larger growth. But all that is gained in this way is sure to be lost, providing these cross breeds are bred together or with other fowls. —Country Gentleman.

Largest Citrus Seedling Nurseries in the World.

A VISIT BY A CULTIVATOR MAN TO THE NURSERIES OF F. H. DISBROW OF PASADENA

To those who have not followed the growth of the orange tree from the seed to the bearing tree, and even to the nurseryman who has watched this growth, there may be something of interest in referring to what is probably the largest orange seed-bed in the world, and to the manner of handling the seeds and the young plants.

It was the pleasure of one of the

On the Home Place.

Cultivator men recently to visit this large seed-bed which is located in the outskirts of the City of Pasadena, north and east of town, and is the property of F. H. Disbrow who has followed the business of producing seed-bed stock for the past twelve years. He has also grown budded trees for orchard planting but the bulk of his business is simply in securing the seed, planting in the specially prepared beds and raising to one year old, when they are disposed of in large quantities to nurserymen. This year his production will be larger than ever before, and as to quality, certainly finer seed-bed stock is never seen. There is nearly one acre of ground covered by the lath house in which the plants grow, and to say how many thousand of them there are, would be merest guess work. The Cultivator photographer tried to get a good photograph which would give an idea of the immensity of this production and the quality of the plants, but there is so little of prominence in the mass of the plants which appear in the photograph, as much like alfalfa as anything, that it is impossible to show in the half tones a picture which has much interest.

One must really make a visit to the place in order to appreciate the quality of the stock. Many of the plants are six inches in height, others a foot and some of them have already made two feet of growth above ground and are almost large enough at the base to bud even at this time.

In variety, Mr. Disbrow has the ordinary sweet, the Florida sour, pomelo, trifoliata and the rough lemon. These five varieties each have their friends, the Citrus Trifolita being the latest claimant for favor. And while it has been supposed by some to be a dwarf variety, in reality it must be said, in Mr. Disbrow's seed-bed the strongest and largest growing stock is the trifoliata. This particular variety is a Japanese deciduous tree which bears fruit of no value whatever, but of it it is claimed that its being deciduous compels the orange tree to be nearly dormant at that season of the year when frosts are most liable to injure. This is claimed to make the tree far less liable to injury by frost than the ordinary sweet and polemo root which is that of a natural evergreen tree thus liable at any season of the year to be producing strong growth. The trifoliata has been thoroughly tested with most satisfactory results in Florida and is rapidly growing in favor in California. Trees budded upon this stock are somewhat smaller than upon other roots, but are by no means dwarf. It is well known that trees budded to this root bear younger and heavier and with the slightly dwarfing habit permits of the trees being planted closer together in orchard. These three factors will doubtless make up for any difference in size, and if other features are more desirable than the other stock, it is surely worth the trial. Being very thorny it makes the best of plants for hedges.

G. L. Taber, a large grower and nurserymen of Florida, says of this stock:

"Unlike most of our cultivated citrus fruits, this is not a hybrid, sport or derived sort, but a primitive, wild species, reproducing itself practically without variation from the seed. It is a native of Japan, where it grows wild, and has long been used as a stock for cultivated varieties of the orange. It is deciduous, has dark, glossy green trifoliata leaves, and is thickly studded with stout thorns. Its habit of growth is peculiar, being very angular and distinct. It is entirely hardy throughout the Lower South, being unaffected by such frosts and freezes as occur in this region. Specimens, entirely unprotected, have stood the winters uninjured for years as far north as Washington." He also adds that "The use of this stock will certainly reduce the frost risk." The fruit on trees budded on this wood is also said to ripen earlier in the season.

As to size of the tree Mr. Taber adds:—
